Tuscarora, Nevada.

[Written for the PRESS.]

The picturesque little town of Tuscarora nestles at the foot of the lofty Mount Blitzen. It is bordered on the east and west by rolling hills, which gently slope into the beautiful Independence Valley through which the Owyhee river courses leisurely. This town, noted for its rich silver mines, is located in the northeastern part of Nevada. The summers are short and very dry, as but little rain falls in this region, consequently there are but few clouds to obscure the hot, dazzling sun, which shines in all its glory upon the fragrant sagebrush and brilliant cacti. Tuscarora probably owes its existence to the discovery of the Grand Prize mine, which was located by an old prospector, who has long since rested under the sod.

There was one who in those early days held the position of Superintendent of the Prize—as it was generally called—who has also crossed the mystic river. His name was Jerry Dayton.

There was not a man about the works but welcomed his coming, there was scarcely an nohln in the streets but expected to hear his merry "good morning." It was with regret his employees heard of his resignation, for after that he took up his residence in the Golden State. On several occasions he was met on the streets of San Francisco by some of his former employees, who informed him of their financial embarrassment. Without a word, he slipped his hand into his pocket and brought forth the shining dollars, and gave them without the least reluctance.

The vacancy made by Mr. Dayton's resignation was filled by Mr. J. E. Dixon, who also gained much popularity by his conscientious scruples and geniality.

The Grand Prize, together with many other mines, yielded valuable ore abundantly, thereby giving employment to hundreds of men,

NAVAJO AND INDEPENDENCE MILL.

who, until 1884, received for their labor \$4 per day. But when silver declined, wages were reduced to \$3.50 per day.

Although the Prize has more than likely seen its best days, there are many other mines in Tuscarora which are yet in their infancy, among which may be mentioned the Navajo, Commonwealth, North Commonwealth, Bell-

Isle, North Bell Isle, Nevada Queen, Del Monte, Diana and Dexter.

The Navajo prospered for years under the superintendency of W. C. Price, who is now a resident of Oakland, having resigned in favor of R. M. Catlin, who is a well-known and respected citizen, possessing more than ordinary ability, as well as being a man of intelligence

and education. He is very ingenious, having lately invented a gun, for the patent of which he is offered \$30,000.

Some of the above mentioned mines are superintended by H. T. Coffin, who has gained the confidence of the community, and discharges his duties in a manner that would do credit to a man twice his years.

The photographs sent are those of the Navajo and Independence mill and the Grand Prize mill. The latter has been idle some time, but the company has a complete concentrating plant and the concentrated ore is worked at the 20-stamp Union mill. This Union mill of Tuscarora is owned by the Commonwealth Con., North Belle Isle and Nevada Queen Companies, and is now doing most of the work of the district. The Navajo-Independence mill of 10 stamps has been idle for some months, but may start up soon on Belle Isle ore. They have at this mill two Howell-White furnaces, and by a double roasting process adopted, have succeeded in obtaining results as high as 92½ per cent.

Although this town has a population of but about 1500 inhabitants, it can boast of the progression of its temperate and industrious people.

One of the brightest of Nevada's young men, Geo. W. Peltier, resides at Tuscarora. When he had scarcely attained his majority, he distinguished himself as being a thorough business manager, and it is due to his perseverance, energy and good management that he has attained success. Although he, together with other persons who have controlling interests in Tuscarora, have at times been criticised severely, yet there is scarcely a laboring man there who will confess that, so long as he is compelled to work for wages, he would prefer Tuscarora to any other mining town on the coast.

GRAND PRIZE MILL, TUSCARORA, NEVADA.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Golden Era Mine.

(From our Traveling Correspondent.)

EDITORS PRESS:—Leaving Columbia, Tuolumne Co., I drove out through the small but fertile fruit ranches that skirt the town, until the road wound down the mountain side to the Davis mine, where I exchanged my cart for a saddle and continued on my way over a mountain trail. Immediately below was a new road in the course of construction to the mining and lumbering sections above. Far below wound the south fork of the Stanislaus river. Swollen by the melting snows, the stream splashed, churned and dashed against its boulder bed as it sped on its way to the sea. Above, below, and on every side the forest trees, as yet untouched by man, covered the rugged mountain sides with their green leaves and waving limbs. Now the trail ascended rapidly, and you look far down the mountain's precipitous sides and wonder whether if your horse lost his footing, and you started down, down, down, would you know when you got there. But the summit is reached, and as you look away beyond at the tree-clad mountains, with the river winding its silvery way at their base, all thoughts of fear give way to one of admiration if not veneration. But all things have an end, and before the distance seems half covered, the horse stops at the Golden Era mine, commonly known as the Page mine.

The genial Superintendent, Mr. H. F. Lucas, extends a hearty welcome, and soon the wants of man and beast are well cared for. Night soon sets in and then the elements turn loose, in the heaviest downpour of the season. Occasional flashes of lightning followed by peals of thunder seem to further liberate the flood, but we are warmly and comfortably housed and so sleep all the sounder for "The patter of the rain upon the roof."

Daylight finds us out, and as the sun drives away the mists, the mountains loom up grandly in their rugged beauty. Breakfast over, we wend our way up the trail to the mine.

The Golden Era mine is located near the summit of the mountain on the south side of the south fork of the Stanislaus river and is distant 11 miles northeast of Sonora. The course of the vein is that of the mountain, also northeast and southwest. The vein crops over 1000 feet above the river, thus affording unusual facilities to tap the vein from the precipitous sides of the mountains. Previous to the purchase of the mine by the present owners, it had been operated by Mr. Page and his partners who developed the mine as I found it. In their work they had not differed from the usual experience of the miner; the five-stamp mill was erected without mishaps, and the battery soon had a lien on the mine that made it impossible to work but three of the stamps. No arrangements were made to save the sulphurets, and in this crude, wasteful way, the ores of the mine were milled. Notwithstanding the loss which must have resulted, the owners were able to show handsome receipts for \$30,000 from 2000 tons of ore extracted and milled. By reason of the size of the vein and extent of ore developed, it is difficult to see where the ore was extracted.

The vein is opened by two shafts from the surface to a depth of 112 and 125 feet and show from two to eight feet of finely ribbed quartz. Two crosscut tunnels have been driven to connect with the shafts. The north tunnel is 170 feet long and taps the vein at a depth of 125 feet. From this a drift has been run south 112 feet on the vein, which shows an average width of three feet, all fine-grained, ribbed quartz, enclosed in solid smooth walls of metamorphic slate, with a good gouge on both walls and more or less dyke matter. In this drift a space 80 feet long and 30 feet high has been stoped; the balance of the ore is intact. The south crosscut tunnel is 108 feet long, and cuts the vein 112 feet deep. From the point of intersection a drift has been driven southwest 110 feet. The vein throughout the drift averages four feet in width all fine ribbon quartz. The only ore extracted from this drift is that taken from a small stop 10x12 feet. From the bottom of this drift, a winze has been put down 30 feet, which shows very high-grade ore, much more heavily sulphuretted than that in the drifts. Back of this vein runs a parallel one, which is out in the north drift by a four-foot crosscut. The vein is three feet wide, of granular quartz carrying free gold. The nearness of this vein points conclusively to the fact that in another 100 feet in depth it will come in and swell the main vein to twice its present proportions. The ore in the drifts is all similar in character, not alone in the length of the workings, but in the width of the vein as well, which is unusual for ribbon quartz. The vein matter carries bright free gold, and iron and galena sulphurets. The present owners, before purchasing, sampled the vein thoroughly, and shipped the ore to Denver for treatment. The results far exceeded their most sanguine expectations, and showed \$32 a ton in free gold, and \$300 a ton as the value of the sulphurets. The percentage of sulphurets is not large in the present workings, but the short winze ank shows that they are rapidly increasing in depth. The host feature of the mine is this: The entire vein, for the

whole length of the workings, is above average milling value. In consequence, there is no waste quartz, and by reason of the width of the vein, no dead work. From the drifts, the track leads direct to the mill. The old mill has been set upon its feet again, and made as new; a Pelton water-wheel put in and concentrators added. When complete, there will be little else than the old battery remaining of the old mill. The mill is of five stamps, and will be used to thoroughly test the ores of the mine.

Mr. Lucas intends to connect the drifts, and will then have the vein opened to an average depth of 119 feet and 335 feet on the vein. At the same time the drifts will be driven ahead, and the winze put down. When the vein at this station is thoroughly developed, a crosscut tunnel 300 feet long will be driven 450 feet below the present workings. From this point, the vein will be extensively exploited, and a large mill erected capable of handling the ores of the vein rapidly, economically and successfully. This lower tunnel will no doubt find the two upper veins united, and make an eight-foot vein of ore that at this depth (568 feet) will probably be handsomely charged with sulphurets. The mine owns an excess of free water, with a fall of 200 to 500 feet, and all of the timber the mine can ever use, which added to the size of the vein, the ease with which the vein matter breaks and mills, the firmness of the walls, and the economy of operating by tunnel make it possible to mine and mill the ore for less than \$3, as at present equipped; and when the larger plant is erected, bring this sum down to \$2 a ton. Attention was first called to this vein through the richness of the gulches below it, in placer gold pieces, realizing \$78, having been extracted. This came from the surface croppings, which, with the exception of the two shafts have not been explored. The mine is a full location of 600x1500 feet with an additional mill site and 160 acres of timber and farm land, recently acquired on the summit of the mountain and directly above the mine. The superintendent's cozy residence, the boarding-houses and stables are just below the mill, on a little bench, while the mountain continues on down to the river, far below. At present the mine is reached by wagon-road via Sonora and Hyde mine or via Columbia and Yankee Hill road. A new road is now in course of construction from Columbia direct to the mine which, when completed, will bring the mine within six miles of Columbia, passing through one of the most picturesque sections in the State.

That the mine has not been bought by capitalists before is from no fault of the mine itself, or want of desire on the part of mining operators, but was due to the fact that it was considered and heretofore found impossible to secure satisfactory terms and conditions from the owners. Mr. Lucas brought his long experience and business tact to bear, and in this as in all else, succeeded. The company is fortunate in its superintendent—a gentleman "perfectly white," a fine linguist, who has mined in all parts of the United States, is thoroughly familiar with all the details of the business, and endowed with unusual business ability. Under him the Golden Era with its large vein of high-grade, free-milling ore, coupled with the unusual advantages the mine possesses in situation, free water and free timber, all in a favored climate where mining can be conducted every day in the year, make it not only probable but undoubtedly a fact that the Golden Era will exceed in value the old and famous Dead Horse mine of this county, which, with its four-foot vein of \$6 ore made its fortunate owners millionaires.

California Mining Interests.

EDITORS PRESS:—It seems to me the position you have taken as regards the mineral exhibit for the world's fair, is decidedly wrong, and will not be seconded by the miners of this State. To pack up and transport the collection of the Mining Bureau or that of the State University, is to break up and destroy both. The Mining Bureau might as well close its doors as to consent to its removal. The move is a well-devised plan, however, to save drawing from the \$300,000 appropriation, the \$50,000 due the mining industry, for making a collection.

It is very clear that the powers that be, are figuring, simply, to use the mineral exhibit as a cat's paw for other special interests, for there seems a desire to hoodwink every interest, at the expense of mining, and yet every potato raised or orange plucked is for gold. The Grangers killed the goose and the State has lost a product of nearly \$80,000,000. The State is languishing for the want of money, but the very interest that produces it receives no favors. Manufacturers are half-handed, and yet more immigration is called for. For what? To reduce the State to greater poverty, and to have more crosses heaped upon it? What California wants is to produce more gold and silver, then she has sold backing for all the "blow," without it every industry is crippled. There is one thing Californians forget, and this is, California is only great among Californians.

When California gives more attention to her material interests, and less to speculation and blow, then we need not care. Put every hydraulic and gravel mine to work under just

and equitable laws. To say that debris cannot be retained is to question the engineering skill of the age. Open our quarries and utilize them in our buildings. Open our iron mines and make our machinery of California iron. Give encouragement to the miner, and he will fill your coffers with gold and silver.

ALMARIN B. PAUL.
Middle Creek P. O., Shasta Co., Cal.

Curious Facts About Seas.

The oceans and seas are the great reservoirs into which run all the rivers of the world. They are the cisterns which finally catch all the rain that falls not only upon their own surface, but upon the surface of the land as well. All this water is removed again by evaporation as fast as it is supplied, it being estimated that every year a layer of the entire water surface of the globe over 14 feet thick is taken up into the clouds to fall again as rain.

The vapor is fresh, of course, and if all the water of the oceans could be removed in the same way and none of it returned it is calculated that there would be a layer of pure salt 230 feet thick left in the bottoms of these great reservoirs. This is upon the supposition that each three feet of ocean water contains one inch of salt, and that the average depth of all oceans is three miles.

At a depth of 3500 feet the temperature is uniform, varying but a trifle between the poles and the equator. In many of the deep bays on the coast of Norway and other Arctic countries the water often begins to freeze at the bottom before it does at the surface.

At the same depth (3500 feet) waves are not felt. Waves do not travel, that is, the water does not move forward, although it seems to do so; it remains stationary. It is the rising and falling that moves on.

The pressure of the water increases rapidly with the depth. At a distance of one mile the pressure is reckoned as about one ton to the square inch, or more than 133 times the pressure of the atmosphere.

To get correct soundings in deep water is difficult. The best invention for the purpose is a shot weighing about 30 pounds which carries down a line. Through the shot or "sinker" a hole is drilled, and through the hole is passed a rod of iron, which moves easily back and forth.

At the end of the bar a cup is dug out, the inside being coated with lard. The bar is made fast to the line, a sling holding the shot in position. When the bar, which extends below the shot, touches the bottom, the sling unhooks and the shot slides downward and drives the lard-coated cup into the sand at the bottom. In that way the character of the ocean's floor is determined.

If the surface of the Atlantic were lowered 6,554 feet it would be reduced exactly half its present width. If the Mediterranean were lowered 660 Italy would be joined to Africa, and three separate seas would remain.—*St. Louis Republic*.

Osoeola District.

Prospects are brightening at Osoeola District, out in White Pine county, and indications are good for a prosperous season. The deep snow will afford an abundance of water for the placers. At present there is no work going on in the quartz lodes, but there soon will be. The Cumberland Osoeola group, now owned by a Boston syndicate, will start up within the next 30 days. They will sink a shaft and run a tunnel and do general development work on the Cumberland, which has a shaft down 100 feet and a tunnel in 80 feet, and has been opened at other points on the eight-foot vein, which has four feet of pay ore, consisting of white honeycombed quartz, which will average about \$28 in free gold. The Osoeola mine, belonging to the group, is one mile away, and has a vein three feet wide that runs \$22 in gold. It has a shaft down 80 feet, and drifts have been started both ways; then there is a good stop above. This vein has been stripped on the surface a distance of 600 feet. The Royal Flush has a shaft down 160 feet, with 18 inches of ore at the bottom that mills \$30 in gold. The Revenue has a vein two feet wide, on which a shaft has gone down 20 feet. This ore is still better, running from \$30 to \$45 per ton. These four claims owned by the Boston syndicate promise to develop into a very big gold property. It is only lately that they were purchased from Doff Brown by the Raddatz Brothers and then sold to the Boston men, who have fully paid for them.

It is related of a run that was made in one of the bare this spring, where in a space of 80 feet long, 12 feet wide and an average of eight feet deep, Boone Tillford took out \$2500 in gold. He now has six or eight men in his mine and some others are at work, and all expect big pay this season. The Osoeola Gravel Mining Company is handling a large amount of gravel this season, and will make a big cleanup in gold.—*Reno Gazette*.

FISH IN DEEP WATER.—Divers in the clear waters of the tropical seas find that fish of different colors, when frightened, do not dart in the same direction, but that each different kind takes shelter in that portion of the submarine growth nearest in color to that of the fish.

Electric Power for Pumping.

The Amador Ledger says: On Monday we paid a visit to the property, now the foremost mine in the northern section of the county. We went more particularly to look at the electric pumping machinery recently put in, so as to be able to give an intelligent report of the same. The Gover was shut down some 15 years ago, on account mainly of being unable to control the immense flow of water encountered. It had reached a depth of 900 feet, with plenty of pay rock in reserve. A stream of water of 40 miners' inches was encountered, which defied all known methods to handle with any prospect of successfully operating the mine, so the property was brought to a standstill. It remained idle for nine or ten years, until Jonas Call, the present superintendent, took hold of it with other prominent stockholders, determined to place it on a paying basis if possible. The shaft was full of water to within 80 feet of the surface. They tried various methods of controlling the water. A 600-gallon tank was used for a time, but this was unable to cope with the abundant water. A steam-pump was put in, and this consumed six cords of wood per day, and this would not pay. With these devices the mine has run along for several years, but they have never been able to drain the shaft and work the 900 level, where the best ore was said to be located.

Finally they entered into a contract with the Edison Electric Company for an electric pumping plant with a capacity of 250,000 gallons per day, to be erected at the expense of the company at a cost of \$500, the Electric Company guaranteeing to run the same for a period of 60 days, at its own cost, as a test to show that the plan is practicable. The company also guaranteed to keep the plant in repair at a cost of not to exceed \$200 per year.

Some trouble was encountered at the outset owing to inexperienced and incompetent workmen being sent up to erect the machinery. The difficulty was with the motors in the shaft. Water and dampness affects electrical apparatus injuriously, and owing to imperfect measures to avoid this danger one or two armatures were burned out. As soon as perfect insulation was secured, the machinery worked like a charm, and has fully come up to the standard claimed for it.

The plant consists of the dynamo of 40-horse power, located near the mill, a quarter of a mile from the shaft, operated by water by a Pelton wheel under a pressure of 340 feet. The Pelton wheel makes 430 revolutions per minute; the armature of the dynamo making 920 revolutions per minute. From the dynamo the power is transmitted by means of two copper wires to two motors and pumping apparatus underground, one at the 300 foot level, the other at the depth of 600 feet. The reason why two pumps were placed in this manner was, that they have two large bodies of water to contend with, one at each of the levels named, and besides, if one pump should get out of order, the other can be kept going. While we were there, a steady stream of 13 inches of water was being pumped out of the shaft, without any trouble whatever. The 60 days' test expires this week, and the company is fully satisfied with the performance. In this time the shaft has been drained to the bottom, and to keep the mine clear requires the electric pump to be kept in motion only four hours daily. It takes 60 inches of water to run the dynamo and pumps. This for four hours daily would make an average of 10 inches every 24 hours, which at 20 cents per inch makes a cost of \$2 per day for controlling the water. To this must be added wages for man at dynamo and pumps while the same are running—say \$3 per day. The total cost would then be \$5 per day. Under the steam-pump system it cost between \$20 and \$30 a day for wood alone.

That power can be transmitted by electricity cheaper than by any other known method is clearly demonstrated here. A Cornish pump takes four inches of water for every inch discharged; the Edison company guarantee to use only 3½ inches for every inch pumped out.

An immense saving is also made in the size of the shaft. To operate Cornish pump or water tank requires a compartment shaft 5x4 feet for that purpose, with heavy timbering; also vast excavation underground to accommodate the cumbersome machinery. With electricity, all this is dispensed with. Room for two small wires and the discharge pipe is all that is required.

The 40-horse power dynamo delivers fully 35-horse power at the pumps underground. It is claimed that by compressed air or any other method of transmission less than 30-horse power would be available under the same conditions.

The machinery is harmless. If a person came in contact with the wires and received the full power of the current, he would receive no serious injury. It is easily handled, requires no expert to manage it, and altogether is one of the finest pieces of machinery we have ever seen.

We were taken all through the mine and mill, and every detail was explained to us by Mr. Call Sr. and his son A. B. Call. This is the first application of electrical energy to pumping underground, and as the question is of vital moment to the mines of Amador county and elsewhere, these gentlemen are

anxious to let mining men generally know the vast superiority of this method over all others so far as tried. The length of this article compels us to reserve our remarks on the operation of mine and mill until next issue.

About Mineral Land Claims.

Henry Marlon and others, who hold mining claims on the lower part of Shasta river, Cal., wrote to the commissioner of the land office at Washington, some time ago, in reference to the matter of railroad selections on mineral land, and received the following answer, which explains to some extent the position held by the commissioner concerning the locality named, which may be considered as having similar tendency to other sections of similar character:

I am in receipt of your letter of March 13, 1891. In reply I have to state the records of this office show that Twp 40 N. R 7 W. M D M. is within the grant to the Oregon division of O. P. R. R. Co., and that the odd sections therein were withdrawn September 6, 1871.

It does not appear that the R. R. Co. has applied to make any selection in either sections 16 or 25 of said township. It does not appear that any application for patents to mining claims have been filed for land in either of said sections.

Prior to the selection of land in either of these sections the miners are at liberty to locate and make application for their mining claims, and upon the submission of satisfactory evidence they will be entitled to receive patents for the same.

Land in said sections having been returned as agricultural land, the R. R. Co. will not be required to give notice of its application to make selections, but should you learn that the company has made such application, you will be allowed to contest the same as to such tracts as you may claim as mineral land.

Prior to the application by the R. R. Co. to make selections, or prior to the filing of applications for patents under the mineral land laws, this office will not order any steps to be taken with a view to segregating the mineral land in said sections.

It follows, of course, if you proceed to make applications for patents for your mining claims, and it is necessary to have them surveyed, it will devolve upon you to have such necessary surveys made at your own expense.

If your mining claims are "placers," it may be necessary to have an additional survey made, as they may be applied for by legal subdivisions in accordance with the public land surveys.

Very respectfully,
T. H. CARTER.

Washington Iron.

The Tacoma Ledger, says: Sometime ago in a general meeting of the Chamber of Commerce a committee consisting of A. J. Hayward, J. D. Coughran and Henry Drum was appointed to investigate the entire subject of the iron resources of Washington and report at the chamber.

The committee has met several times and has determined to make a personal examination of the Ellensburg and Cle-Elum iron. They will start for Ellensburg this morning for that purpose, and will remain so long as is necessary to thoroughly investigate the subject. It is understood that the Ellensburg Improvement Co., has a considerable sum for the development of their iron industries, and that if about \$50,000 additional could be secured, enough means would be had to put in a blast furnace and smelter. The committee will find out if enough varieties of ore are obtainable around Ellensburg to make good pig, and if fuel and lime can be obtained cheaply enough in that region to make blasting and smelting profitable. It is not necessary, in their view, that the works should be located in this city, as the manufacturing would come to Tacoma, in case pig iron could be brought here at low rates.

"Both Cle-Elum and Ellensburg have made considerable boast of being in fine iron regions," said Secretary Snowden of the Chamber of Commerce. "If it shall be demonstrated that these boasts are founded on hard facts, the Chamber of Commerce will see what arrangements can be made for the joint development by Ellensburg and Tacoma of their iron resources; but if they shall not have as much as is expected, then other parts of the State will be investigated."

The committee will be accompanied by Ed A. McCormick, a practical iron man of long experience in Pittsburgh.

THE PUBLIC DOMAIN.—It is telegraphed from Washington that Commissioner Carter, the new head of the General Land Office, is accomplishing wonders in the way of issuing land patents, and the settlers on the public domain throughout the great West will before long discover that the new Commissioner, coming as he does from one of the new States, fully understands their wants, and sympathizes with their efforts to get titles to the lands they have entered upon for homesteads. Yesterday there were issued from the General Land Office a total of 736 patents, and the day before there were 2000. This is an unprecedented number for two days, almost as many as were issued during the entire period of the last administration. It is expected at the present rate of progress the General Land Office will speedily catch up with its work.

Natural Gas at Stockton.

Under the heading of "Natural Gas for Power," the Independent contained an editorial article on the advantages of natural gas to Stockton, its supply, etc., which is the main was correct. It contained a few errors, however, as the information for the article evidently was obtained by observation by the writer of gas enterprises here and from local alleged gas experts.

The writer speaks of Stockton gas as "water gas," and that of the East as "dry gas," as though they were two different elements and derived from different sources. That is a mistake, says the Stockton Record. The gas strata underlying this city is the same as that underlying the Eastern gas districts; the Trenton rock which overlies the porous gas-bearing rock in the East is found here overlying the same kind of porous rock carrying "dry gas," just the same as in the East. But when that dry gas strikes the water, of course it becomes "water gas."

The Independent falls into the error of asserting that the sinking of gas-wells here is less expensive than in the East. The contrary is the case. In the great dry-gas districts of Ohio, the average depth of the wells is less than 1400 feet, though one at Toledo is 3500 feet. But at Findlay, only 25 miles south, and for a distance of 40 miles in all directions from that place, the wells are but 1200 and 1300 feet deep. There is no artesian water to contend with, neither is there any quicksand. First, a strata of limestone rock is encountered, and then gravel-beds and clay until the Trenton rock is struck. Here the casing is stopped, and the water shut off, when boring proceeds dry. When the gas-bearing rock has been penetrated about 30 feet, a dynamite cartridge of 60 or 100 pounds is exploded in the bottom of the well, and the flow of gas by this means is in some instances more than doubled, and instead of being measured as here by thousands of feet, it is done by millions. None but sore casing—water-tight—is used.

When the gas-bearing rock in that region is passed through, salt-water is encountered, the same as here, and the well is either filled up to the gas strata or abandoned, as the salt water destroys the gas.

In none of our gas-wells has the flow been increased by depth of boring, after the gas-bearing rock has been passed, neither will it ever be done, unless another strata of gas-bearing rock is encountered.

All the gas was originally in the porous formation beneath the Trenton rock, and when that rock is once passed and salt water flows up the pipe, the well is injured. The gas which is found in the first strata of artesian water is always weak, as it has been forced up through seams in the rock to that position, and as boring progresses, each successive stream of water contains more gas, until the porous rock where the principal supply is found is penetrated.

Exactly the same conditions obtain in the Eastern gas fields, only they have no artesian water or quicksand to contend against.

That there is a heavy pressure of gas beneath the surface in this city is evidenced by the fact that it is forced up into all the streams of water for hundreds of feet above, and when the time comes that a company of capitalists take hold of the matter, and go to work in the right way from the start, gas will be led up to the surface in its dry state, and instead of being neutralized or destroyed by contact with salt water, its full force will be made available in a supply similar in magnitude to that of Eastern wells, and the Record predicts that within the coming year the experiment of shutting off the water and testing the gas-bearing strata in its natural dry form will be made with the happiest of results.

A New Enterprise.

For sometime work has been prosecuted in the neighborhood of Chili Bar, having for its object the establishment of an electric plant for the distribution and sale of electricity for power and illumination. The Pearson Bros., William and John of this city are at the head of this enterprise. Others may be connected with the business, but if so, their names have not been made public. These gentlemen have taken up a water right on the American River some distance above the Chili Bar bridge. From this point it is their intention to construct a large flume and ditch to a point near the mouth of Kelsey Canyon, a distance of about one and one-fourth miles. At the latter point they expect to locate either a turbine or an undershot water wheel to operate a dynamo. It is calculated that they will have a pressure of 40 feet and that with the head of water they can obtain, they will be able to generate 400 horse power.

A survey of the ground has been completed and seven or eight men are now employed in grading for the flume.

An order for 200,000 feet of lumber has been placed with J. & J. Blair to construct this flume, into which the water will be diverted by a wlog dam in the river.

It is believed that the work can be completed and the machinery placed by the beginning of next winter, or at least not later than the opening of the new year. Lines will then be ex-

tended to this city and to other points where there may be a demand for electric power or lights.—El Dorado Republican.

Lassen Irrigation.

In the record of the progress of irrigation development, one portion of the State has not received the attention to which it is justly entitled. The locality referred to is Lassen county, and an idea of the extent of the irrigation enterprises of that section may be gathered from the fact that within three years no less than 18 storage reservoirs of large size have been built for the purpose of supplying water for the cultivation of the large bodies of arid, but exceedingly fertile lands of that county.

Another project of the same sort is now under way, which, when completed, will rank among the foremost in the State. The location of this new enterprise is in the Honey Lake valley, and from the report of L. H. Taylor of Sacramento, the engineer in charge of the work, the following interesting facts are learned:

The source of supply is Long Valley creek, which has a drainage area of over 400 square miles in the Sierra Nevada mountains. About six miles above the mouth of the creek, there is a narrow canyon through which the stream flows, and here it is proposed to construct a dam. This will be of earth, with a puddled core, and will have a thickness at the base of 443 feet, sloping gradually at the same angle on both sides to the top, where it will be 20 feet thick. The extreme height of the dam will be 94 feet. At the base, in the bottom of the canyon, it will be 200 feet long, at a height of 85 feet the length will be 740 feet, and at the full height the length will be 900 feet.

A reservoir with an area of 1000 acres will thus be constructed which will have an average depth of water of 31 feet. This will give an available supply of 1,350,000,000 cubic feet, or 10,125,000,000 gallons of water, or considerably more than the famous Bear Valley reservoir. That the source of supply for this reservoir will be ample may be seen from the fact that measurements taken by the stream show a flow of 1600 to 15,000 miners' inches, while the greatest evaporation noted has been but two inches a month in similarly situated reservoirs in the same county.

The water will be conveyed from the reservoir in open canals to the lands which it is proposed to irrigate, and which comprise a large area of fertile soil. The reservoir will have a capacity to supply 100,000 acres, but it will be some time, of course, before so large an area will be put under cultivation. The entire cost of the dam and the diverting canals, however, will not exceed \$100,000, from which it will be seen that this is one of the cheapest irrigation enterprises in the State.

The lands that are to be irrigated from this reservoir lie at an elevation of 4000 feet, and are as fertile as any in the State. They all require irrigation for cereals, grasses, fruit and ordinary farm crops, but the results are most remarkable. From 35 to 45 bushels of wheat and from 45 to 80 bushels of barley are the average crops, and the grain is of the finest quality. Alfalfa is a favorite crop, this being a splendid stock-growing section, while the potatoes produced here are superior to even the famed Salt Lake product. For apples and similar hardy fruits no better location exists. The pioneer apple-growers of Honey Lake valley enjoy profits that equal those secured by the citrus fruit producers of the South. This valley is destined to take high rank for its apples, pears, cherries, plums, etc.

A good commencement has already been made in actual work on the dam, and it is expected that by next season the reservoir will be completed and water will be supplied.

Not the least of the advantages of the Honey Lake valley is the fact that it is already traversed by a railroad (narrow gauge) running north from Reno. The present terminus is Amadee, 85 miles north of the starting point, but the line has been surveyed through to Oregon, and it will undoubtedly be pushed to completion, thus giving the many fertile valleys of Lassen county an outlet for their farm products in two directions.—Chronicle.

Cleaning Gold Off Copper Plates.

Take the plates and put them over a red charcoal, coal or coke fire, and evaporate the quicksilver off them slowly. (If the fireplace of a spare boiler is large enough to admit the plates, the best plan is to make a thin red fire there and use it.) After all the quicksilver is evaporated, the plates should be taken out and allowed to cool. They should now be rubbed over with muriatic acid, and put in a damp place all night. The next process is to rub them over with a strong solution, made with equal parts of salammoniac and saltpeter, and again placed over a red fire and heated slowly, care being taken not to allow them to get red hot. When the proper heat is got on them, the gold scale will rise in blisters; when this takes place, the plates should be taken off the fire, and the gold scraped off. Another way, if a trough is available (wider than the plates), is to fill it half full of water, and when the plates are taken out, dip them in the water, when the gold will scale off. If there should be any part

of the plate on which the gold has not risen, these parts should be again rubbed over with the solution and again fired. If these directions are properly carried out, the gold will be completely taken off the plates.

After the gold scales are collected, they should be put in an earthenware dish and covered with nitric acid until all the copper is dissolved; when this is done, the gold can be smelted in the usual way, but corrosive sublimate should be put in the crucible (after the gold is melted) until there is no more blue flame given off.

A Lixiviation Plant.

NUMBER III.—CONCLUDED.

[Read by C. A. STETTER, San Francisco, before the American Institute of Mining Engineers.]

10. Auxiliary Machinery.

Air Compressors.—For Montejus or geyser-pumps and for the press-tank, two separate air-compressors are needed, the one furnishing air of about 30 pounds, the other of 150 pounds pressure. The size of the compressors must be calculated to meet the demands of the capacity of the works. The Montejus air-compressor should have a capacity to raise all the stock-solution needed per day in about eight hours, so that the plant is not in operation all the time and the solution can be transferred quickly.

Sulphide-Sampler.—The breaking-up of the lumps of sulphides and other precipitates, as they come from the drying-chamber, is done in an ordinary small sample-grinder, as sold by any western foundry.

Boilers.—If considerable steam is needed for heating the stock solution and wash water prior to its precipitation by scrap-iron; also for running Koerting ejectors and vacuum pumps a separate boiler is desirable for the lixiviation-plant proper.

Fire Pumps for Sluicing Tailings.—If the water in the pipe-line has not sufficient head for sluicing tailings, a fire-pump for this purpose becomes necessary. A steam-pump of the Keweenaw type may be used with 10-inch steam and 5-inch water-cylinder, 12-inch stroke and 4-inch suction and discharge. But I would recommend a Koerting steam-jet fire-pump, which is much cheaper than a plunger-pump and not less efficient.

11. Pipe-Line.

Iron gas-pipes are used for conveying stock-solution and sodium sulphide solution.

They should be joined by flange-couplings. The size of the stock-solution-pipes above the ore-tanks depends on the capacity of the works, and the position of the storage-tanks, producing more or less head. In large works they are generally taken from three to four inches in diameter.

12. Cocks.

The only cocks resisting for a long time the corroding action of lixiviation-solutions are the Pett-Cady iron-body, Bower-Barffed plugs, sheet-steel cocks, sold by Fairbanks & Co., New York. These cocks last very well, even on the sodium-sulphide mixing-tank. They were first introduced in lixiviation-works by the writer at the Marsac Mill, Park City, Utah.

13. Protection of Iron by Asphaltic Covering, and other Notes on Construction.

Castings and Pipes.—Castings and pipes exposed to hyposulphite solutions must be protected by an asphaltic covering; the pipes, of course, on the inside. Pipes conveying sodium sulphide solution do not require such covering. A pure asphalt, called "Maltha," manufactured in San Francisco, the residue from distillation of heavy California mineral oils, now shipped in considerable quantities to the eastern States, is exceedingly well adapted to this purpose. The maltha is melted in a sheet-iron trough, and the clean and dry castings or pipes are immersed in the bath. They should remain there until the iron has reached the temperature of the liquid asphalt; this insures firm adhesion of the asphaltic covering to the iron. The propeller-screws and shafts for the precipitating-tanks are covered in the same way.

Montejus tanks and the press-tanks need different treatment. Here a malthine varnish is used. To the clean and dry inside of the vessels, a coat of varnish is applied. After drying, a second coat is put on, and, as the painting progresses, cotton cloth—weight about six ounces per yard—is pasted on, care being taken to saturate overlapping joints with varnish. On the top of the tank the cloth is drawn over the flange. The cover is treated in the same way. Finally, a third coat of varnish is put over the cotton cloth. After perfect drying, the cover is hoisted on, using a soft rope saturated with varnish for a gasket.

Fastening Castings and Flanges to Tanks by Bolts.—Bore holes to fit bolts close; counter-sink bolt-heads into wood and cover with thick white lead. Washers behind bolt-heads are also laded in white lead. Bolts are first covered with asphalt.

Connecting Rubber Hose with Gas-Pipe Nipples.—The following method was communicated to me by F. M. Johnson: Draw out the nipple to fit the inside of the hose closely; heat the nipple so that it will melt rubber without burning it; then press the nipple into the hose about four inches and immerse immediately in asphalt varnish for cooling. The hose adheres so firmly to the iron that it can only be removed by cutting.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GOVER.—Amador Ledger, June 27: This mine is in a more prosperous condition than at any time in its history. Last week we were taken all through the mine and mill. Everything above and below ground is a model of convenience, showing that it is ably handled with a view of securing the best possible results. The shaft is 900 feet deep. The ore that supplies the mill is taken from two levels, one at 300 and the other 600 feet deep. At the 300 level a drift has been run north 200 feet, showing a ledge 20 feet wide. At the 600 level the drift runs south 600 feet, in ore all the way, the ledge being fully 20 feet wide at the face. The rock is of low grade, taken as a whole. Occasionally some very rich seams are encountered, but the average yield is between \$5 and \$6 per ton, including sulphurets. This is fully up to the average of pay rock on the main belt, and leaves a fair margin of profit after paying all running expenses. The best ore is believed to exist below the levels now being worked, and with the efficient machinery for controlling the water, the 900 level will soon be opened up, from which big returns are expected. The 20-stamp mill is kept running steadily, crushing about 60 tons per day, or three tons per stamp. Probably in no place in the county is the gold-saving business brought to such a high degree of efficiency as at the Gover mill. The stamps are 900 pounds each; only steel shoes and dies are used. It is run by water power under 365 feet of pressure, taking 50 inches to run the mill. The concentrators are of the Woodbury patent—one concentrator handling the tailings from a five-stamp battery. An independent water-wheel is used to run the concentrators, thereby securing a uniform motion, which is an important point in concentrations. These Woodbury machines have given excellent satisfaction. After leaving the mill the tailings are run over a large area of canvas, where considerable sulphurets are caught. Passing this the tailings are run into a number of wooden tanks, where they are allowed to settle, and these settlements are finally run over a Woodbury concentrator, which also captures the fine sulphurets. After getting through this formidable gauntlet of appliances, the tailings assay only 50 cents per ton. It is believed that even this small loss can be further reduced by adding other settling tanks. The mill yields about 60 tons of sulphurets per month, which run from \$90 to \$100 per ton. The mine and mill give employment to 50 men.

BELMONT.—The superintendent reports for the week as follows: Tunnel No. 1 has been advanced eight feet; total distance 350 feet. The usual amount of ore is being milled from stopes above tunnel level. Plates in mill are yielding well.

MISCELLANEOUS.—Reports from the Hardenberg are to the effect that the ore so far crushed while low grade, is equal to paying all working expenses, and leaving a small profit besides. It is proposed to sink another 100 feet and see what character of ore exists at that depth. The ro-stamp mill is kept running steadily.

El Dorado.

GOOD REPORTS.—Georgetown Gazette, June 27: Good reports reach us from the Schultz mine on Coloma hill. The vein is narrow but bears rich in gold. A San Francisco firm has ordered 150 tons of yellow chrome from Pilot Hill, and it is now being hauled to Auburn. Armstrong & Ritchie are doing slow but sure work on their mine north of town. They have a big ledge easily worked. It is opened in five places on the side of the mountain and can furnish ore by the quantity for any sized mill. The Ambrose & Martin mine, recently handed over to W. S. Lyle of San Francisco, is being prospected by tunnel. W. Gibbs, who has the contract, reports the ore increasing rapidly, and in a few days expects to see the one-foot vein matter on which he began, to cover entire face of tunnel. It is now over three feet and assays up in the hundreds. The Ben Franklin mine, 2½ miles south of town, has been freed from water, and a drift on south line of ledge at 80-foot level will now begin. The open cut in gulch 200 feet on north line of ledge shows, by estimated pan tests, \$18 per ton. Mr. Dent, the owner, has been erecting houses for the convenience of the miners, and also preparing for hoisting and pumping works soon to be erected.

THE VAN MINE, near town, is idle, prolific only in lawsuits between owners. It is a pity their difficulties can not be reconciled. It is certainly one of the best mines in the county. The report we made of this mine last winter from personal investigation as a miner, when the 32-foot crosscut was made and which was widely copied by the press, is substantially correct, and it will not be long before our report will be vindicated by the successful operation of the Van on a large scale.

Inyo.

SYLVANIA.—Inyo Register, June 26: A representative of this paper paid a flying visit last week to several camps east of the White mountains. At Sylvania affairs remain in statu quo so far as the business of the Sylvania Co. are concerned. No work is being done in the company's mines, or in connection therewith. A fine new furnace stands there ready for firing up, and several hundred tons of good smelting ore, belonging to the company and others, lie on the dumps ready for working, but until certain liabilities are settled, nothing can or will be done in that direction. N. Beaudry & Co. are taking out some very fine ore from a mine of their own located about a mile east of the furnace, and expect soon to ship a carload to the Selby works. This ore assays about \$600 in silver, and over \$300 in gold. W. S. Kincaid will soon ship a carload of ore assaying as high as \$400 per ton, from a mine he has recently opened, known as the Kincaid, and situated about two miles westerly from the camp. This, as well as the one previously spoken of, are quite valuable prospects. Frank Buser and his son, John, continue to work away on their old-time properties. They have out and in sight many tons of ore that would certainly pay quite well to work in the camp, but except after tedious sorting, not rich enough for shipping. It is galena in part, but mostly a carbonate lead ore, running about \$50 per ton. It is confidently asserted by others than the owners that the Buser mines alone

could supply ore enough of about that value to keep the furnace running straight along.

TULE CANYON.—Some 15 miles easterly is quite a lively camp. Some 25 miners, including a number of Chinamen, find employment there, mostly in gold placer mining. Big chunks of gold are occasionally found, but the average yield of the placers rarely amounts to more than ordinary wages. The ore from the quartz ledges is unusually rich but not large in quantity. The writer did not visit that camp. Farther up this Cottonwood creek, Sam Piper and others are operating some small gold ledges, and working the ore in this water-power arastra, making grub, but not getting dangerously rich as an average for the year though. Farther up the same stream O. K. Barry, who has put in some 20 years in that locality, continues to work away on his silver ledges, but with no strikes of importance to chronicle, although in hopes as great as ever. Some new parties are about to buy some extensive testing operations on several of the gold ledges in the vicinity, and expect to use the Greenly five-stamp mill for that purpose.

DEEP SPRING VALLEY.—Nathan Gilbert has men at work on the historical old Cinderella mine, and feels highly encouraged with recent developments. The Paysons, at Antelope Springs, are getting out some splendid silver lead ore from a new location by George Payson, and expect soon to ship a carload. Nearby is a very large ledge, said to carry a high percentage of bismuth and gold telluride ore. Antonio S. Cunha is a principal owner in this ledge, and has been operating on it for two or three years, but owing to the peculiar character of the ores, has realized nothing as yet for his labor. From all accounts, this is a property some expert might do well to investigate.

BIG PINE.—Cor. Inyo Index, June 27: The steady and regular interest in the mineral resources of the several belts outlying Big Pine received a lift last week by the appearance of a huge kidney of ore from the claim of Droillard & Broder. The lump weighs 168 pounds and is said by the owners to be just a fair sample of the carload sent out on the northbound train yesterday. The works to which it was shipped allow a price which leaves the shippers a safe margin of profit. From an interview with Scott Broder I am convinced that they have certain indications of capacity and permanency, which assure these long-time prospectors of being the possessors of a valuable claim. It is located only about 14 miles from Big Pine, in an easterly direction, and has been known at the Bay in mining circles as the Scott mine.

Nevada.

THE CENTENNIAL.—Transcript, 25: Superintendent Richards writes to the Centennial Co.'s office that he has the new tunnel in over 1000 feet. The face is in hard, tough bed-rock which works well and needs no timbering. This tunnel must eventually—a few hundred feet further on—cut into the rich gravel channel already developed by the San Jose Co. adjoining. Meanwhile, 20 feet further ahead from the present face or end of the tunnel he will make another upraise to the gravel bed, recently found by the two upraises a few feet above the tunnel, 100 feet apart, showing the gravel to be 100 feet wide. The new crosscut was expected to show an additional 100 feet. It is pay gravel, and its washing is to be commenced as soon as practicable.

COLUMBIA HILL.—Nevada Transcript, June 27: In the locality adjacent to Columbia Hill, quartz mining has never before been so extensively carried on and with such encouraging results as is the case this year. In fact, until within a comparatively recent period gravel mining was the only branch of the gold-getting industry that prevailed there to an extent that attracted attention. At the Delhi, which is the pioneer quartz enterprise of any considerable magnitude, the No. 4 tunnel, which has a depth of 800 feet, is in 1600 feet and shows in its face a three-foot ledge of splendid milling ore. A wize that is being put down from the No. 3 level produces \$40 ore. Eighteen stamps are crushing daily and good profits are realized. Seventeen men are employed and the force will be increased as the opening up of the property progresses. At the St. Gothard, 600 feet east of the Delhi, 24 men are working. The new steam hoisting and pumping machinery was started up yesterday for the first time and moved satisfactorily. The fine new shaft is completed to the drain tunnel, which is 180 feet below the surface at that point. The shaft is timbered all the way down. It is to be sunk as fast as possible to a depth of 600 feet, and will cut the ledge (which varies from one to four feet in thickness and is of paying quality) at a depth of about 400 feet. Some of the ore taken out through the drain tunnel has been milled and gave highly satisfactory returns. At the Enterprise, 600 feet west of Delhi the tunnel is in 430 feet and shows in its face a five-foot ledge which has just been struck. This was a "blind" ledge, and its discovery was a pleasant surprise to the stockholders. Some very rich specimen ore has been taken from it. An air blast is now being constructed, the water being obtained from the Delhi ditch. Six men are working at the Enterprise.

DISCHARGE OF MINERS.—Grass Valley Union, June 23:—Sixty miners were dropped from the pay roll of the Empire mine on Saturday. This was done because of the poor quality of the ore now showing in the mine. Nearly all of these men, however, will remain at the mine and take out quartz on tribute. There is plenty of low-grade ore opened up, but it is not rich enough to pay the regular wages for mining it. Under the new arrangement the full head of 40 stamps will still be kept going. The Empire mine has its poor streaks at times, but never fails to come around all right in the end. This has been the history of its life, but first and last it has yielded an immense amount of gold, and is also celebrated in having been worked for a longer period continuously than any mine in the State. More new ground is to be opened by the sinking of the No. 20 level as speedily as possible.

Shasta.

BULLION.—Shasta Democrat, June 27: We hear that the bullion shipment from the Brown Bear mine at Deadwood last month was \$52,000, the largest monthly output from any one mine in this part of the State we have heard of. The present owners of this great mine purchased it from Grason for \$20,000 after he thought he had worked it out with Chinamen. Since it got into the hands of the present owners—some 12 or 14 years ago—it has

paid large dividends every month, and is now as good or a better mine than it ever was. The Yellowstone mine on East Fork, Trinity Co., was closed down a week or more ago and a large number of men are thrown out of employment.

Siskiyou

QUARTZ AND GRAVEL.—Yreka Journal, June 24: Doc Luttrell has lately discovered a couple of quartz ledges on Indian creek, one of which called the Mammoth, prospects exceedingly good. He has also taken up a good claim on Paterson creek. Doc is an old pioneer of Scott Valley, but has been residing for many years past in Oakland. He has always felt confident of being able to find rich mines in Siskiyou, and returned about a month ago to try his luck. Fred Kols, who struck rich prospects in his bank claim on Klamath river, near Oak Bar, was obliged to stop work last week on account of the pit filling up with water, by the recent rain storms raising the river to flood the diggings. He will soon have the pit pumped out again to resume operations. Lee, Lash & Co., of the Greenhorn blue gravel mine shut down operations last week in hoisting, but are now opening a new shaft near the stage road, or rather continuing an old abandoned shaft were Pipes and others tried to reach bed rock several years ago, but were prevented by water. The hoisting machinery and steam pump will be moved to this shaft, and when the blue gravel is reached, the company will drift up toward their other shaft where the cave occurred a few weeks ago. The Yreka Blue Gravel M. Co., placed a night shift at work in the shaft last Wednesday, and the work of sinking down to strike blue gravel is now progressing day and night. The shaft is down about 24 feet, and water has been reached, requiring the use of gum boots and bailing out, with intention of using a good pump as soon as necessary. The latest report from the Yreka blue gravel mine is that blue gravel was found yesterday, at a depth of 24 feet, which is very hard to dig through, and prospects very good. Before reaching the blue gravel, a body of shale was found indicative of coal, and it is probable that coal can also be found in the country surrounding Yreka basin. The Coal M. Co. known as the Hornbrook syndicate, comprising J. L. Coyle, David Horn and M. G. Burkhalter of Hornbrook, and B. D. Wilkinson, R. R. agent of Montague, including Wise and his partner, formerly working the Willow Creek coal mine, bonded the property last week from Mrs. Wise for the sum of \$7,500, with 18 months time to pay the amount and secure complete possession. This company intend commencing work on an extensive scale in developing the immense coal bed in sight, and will no doubt realize a fortune, as the coal now taken out is said to be of better quality than that used on the S. P. engines brought from below. The coal will bring good prices in this county, as the freight from below makes coal from seaboard too expensive, and as firewood within easy hauling distance of the various towns, especially Yreka, is becoming very scarce, the use of coal will eventually succeed wood if furnished at equal or less cost.

SALMON RIVER.—Siskiyou Telegram, June 27: R. L. Fogundez of Salmon river was in the city for a couple of days last week. He is one of the prosperous miners of his section, and while in S. F. purchased a complete quartz-mill outfit of five stamps to replace the arastra he had heretofore used. He informed the Telegram that, were it not for the great difficulty in transporting machinery over the mountains, many more would follow his example. The truth of this may be considered when it is said that it will cost Mr. Fogundez over \$200 to have the mill carried from Etna to Sawyer's Bar. Those people should have a wagon-road.

HENLEY GRAVEL MINES.—Siskiyou Telegram, June 20: Last Sunday we paid a visit to the thriving mining town of Henley, where we remained over night, returning to Yreka next day. While there we visited as many of the principal mines as our limited time would allow. The nearest enterprise of importance to the town of Henley, is that owned by Mr. A. Harvey, who is at present constructing an enormous reservoir over the old Brass Wire channel. This reservoir will be used for working some of the richest mining ground in the Cottonwood district, comprising several hundred acres. Mr. Harvey has already had an enormous amount of work done, but there yet remains much more to be completed before everything can be put in working order. This gentleman certainly has a very desirable piece of mining property. The next mine we visited is the celebrated Jillson mine, situated about two miles below Henley. Here we found Mr. Jillson, who very kindly volunteered to show us around the mine, and explained the several different formations of earth and stone, with which he is so thoroughly acquainted. This mine is well fitted up, having two large "giants" with which to tear up the gravel and bedrock, besides this, the mine has the best of natural advantages. Being located on a hill above the river, it has one of the finest dumping places in the world, and never can be handicapped by the accumulation of tailings and debris. Although Mr. Jillson was enabled to make but a short run this season, owing to the shortage of the water supply, it is confidently expected that the cleanup will exceed \$7000. At present operations in the main part of mine is suspended, and a small force is engaged in running a tunnel into the gravel, and have already attained a distance of about 150 feet. The only obstacle in the way of easy working is a good-sized strata of pipe-day. The gravel is of almost a sky-blue color, and although it is quite solid, is not too hard for successful working. On the opposite side of the river from the Jillson mine, is that owned by Capt. Wilbourne, who is also working in blue gravel, and is the happy possessor of a good mine. The Rummel mine, farther down the Klamath, we were unable to visit, but were informed by reliable parties, that since the mine has passed under the successful management of I. H. Hazlett it has commenced to yield good returns.

Trinity.

STRUCK IT RICH.—Journal, June 27: A letter from William Toms at New River informs us that they have struck the Ridgeway ledge and that it is very rich. We will probably receive full particulars for our next issue. We have always entertained a very friendly feeling for Messrs. Dean & Toms, and for their persistence and enterprise we think they deserve great credit and success.

Tuolumne.

CLAIMS LEASED.—Tuolumne Independent, June

27: Louis Page has leased the Ferguson, Simonich and Old Austrian claims at Brown's Flat and will run a tunnel 300 feet in length through them, starting in at the Fox claim near where the Austrian Bros. were drowned about five years ago. The tunnel is in 225 feet and Mr. Page expects to strike the vein within 75 feet, when he will follow it through the claims. For timbering he uses red fir, which he says is superior to any other wood for wet or dry ground. At the upper end of the claims the tunnel will be 700 feet below the surface. Many rich pockets have been found in these claims, and systematic work, by means of this tunnel, will doubtless develop many others.

NEVADA

Hawthorne District.

LAPANTA.—Walker Lake Bulletin, June 24: During the week the incline below the tunnel has been continued; formation very large; vein running flatter. Owing to this are obliged to run under the ore, and the iron is found to carry about \$45 in gold. Are stopping above the tunnel and extending the new drift, which is producing ore. In the raise above the east drift from No. 6 incline the chute of ore mentioned last week still continues and is getting larger. Last run of ore milled \$60 per ton.

PAMLICO.—Still extracting ore from the stopes at the north end of the mine. Main tunnel being driven ahead.

CENTRAL.—The 75-foot level is still being extended. Showing very well. Stopes above this level continue to yield the usual amount of ore.

MOUNTAIN KING.—Main tunnel still being extended. The face is now 55 feet beyond the first ledge. The face shows a strong body of talc and quartz, which is believed to be the footwall seam of main ledge.

HARTFORD.—Still sinking on the ledge, producing lead and gold ore; ledge showing strong in bottom.

BEACON.—The stopes from the incline still producing the usual amount of ore.

GOLD BAR.—The south drift, Martinez tunnel level, has been extended ten feet during the week. Ledge strong and producing very rich ore.

CONFIDENCE.—New incline down 37 feet on the vein. Ledge about 2½ feet wide. Quartz on hanging wall carrying silver. Formation softer and looking favorable for ore.

WAR EAGLE.—Stopes yielding usual quantity of good ore.

FAIRMOUNT.—During the week the principal work has been done in the stope above the drift, which still continues to show from five to six inches of 150-ounce ore, with bunches of 800-ounce ore in same, and in sinking incline below tunnel level it shows about four inches of 400 ounce ore.

CHALLENGE.—Still driving main tunnel ahead on the vein; same showing very well.

IDA.—Still producing the usual amount of ore, some of which is very high grade.

NEW YORK.—During the week tunnel has been extended 10 feet, intersecting the parallel vein, upon which a drift has been started to the south.

Morey District.

HIGH GRADE.—Blmont Courier, June 20: We learn from Samuel J. Robinson that Ernest Schendel has found a fine body of high grade ore in the Morey mine in Morey district, Nye Co. Forty or 50 tons of the ore has been taken out and is now on the dump. The value by daily assay is about \$700 per ton. The ore is from a point lower than that which was formerly worked, and required skill and perseverance to develop.

ARIZONA.

MOHAVE COUNTY.—Miner, June 27: It is understood that the Diamond Joe mine will soon be sold to a syndicate of Kingman capitalists. The Elkhart mine has already made a contract with Beebe to haul in 500 tons of ore immediately. Mr. Lawrence, of Ivanpah, was in town Tuesday with several tons of rich copper silver ore from his mine at that place. There are more prospectors out in the hills now than at any time for years past, and a great many good strikes are being reported. Another carload of Diamond Joe ore was worked at the sampler this week, and five or six carloads are in Hackberry awaiting shipment. The Chloride mines are being worked for all they are worth and are showing up well. In fact they are becoming the best producers in Arizona. Tom and James Mulligan are driving the main tunnel on the Big Bethel mine in under the mountain. The have a fine breast of ore in the face of the tunnel and are opening up a fine piece of stopping ground. James Penberthy and H. B. Cox were down from the American Flag mine Tuesday, and reported the mine looking well. They have considerable ore now on the dump which will soon be sorted up and sent down to the sampler. R. C. Hall has been in town this week from the new gold diggings in Death Valley, with several tons of gold ore which he sold to the sampler. The ore is of a good grade, but will not pay to haul such a long distance for treatment.

TOMBSTONE.—Prospector, June 25: If the property owners in Tombstone have not enough confidence in the mines of the district below water to put 10 percent of their holdings into a pumping proposition, how can they expect outsiders to do else than shake their heads and look wise when you talk to them on the question. The pay rolls of the mines of this camp do not show over 150 men at work and about \$20,000 dropped each month by the mining companies. In 1883 the pay rolls amounted to \$200,000 per month and another \$120,000 was dropped for mining supplies. This state of affairs can again be brought about by a little energy on the part of every one.

MOHAVE COUNTY.—Miner, June 20:—The Elkhart mine continues to ship ore to the sampler in carload lots. A great deal of lumber is being hauled to the mines on the west side of the Cerbat range these days. The shaft on the Mexican mine is down nearly 200 feet and the ledge in the bottom is looking fine. L. J. Lassell has gone to the Flores mine, and while there will survey a site for the new mill soon to be erected on that property. Merrill and Cary sent down a small lot of rich ore from the old Hackberry mine which they sold to the Kingman sampler Monday. Work is progressing on the gallow's frame and the hoist on the Ark mine and it will probably be in running order on or about the first of July. Sample and Jamieson have struck a

good streak of ore in the winze now being sunk to connect the upper with the lower tunnel in the Rip Van Winkle. Brawn's and Beebe's big ore teams are kept very busy hauling in the vast amounts of ore now lying on the dumps of the mines throughout Wallapai districts. Hon. P. F. Collins has gone back to the Champion mine. He expects the new tunnel now being driven into that property will cut the ledge about the first of August. Morgan Humphreys and Bob Rouse had a small lot of ore worked at the sampler last Saturday.

BRITISH COLUMBIA.

LOOKING BETTER.—*Miner*, June 20: Not satisfied with any of the offers made for their property, the owners of the Queen Victoria, a copper lead on the north side of the Kootenay, have been busy for the past few weeks doing more development work. The tunnel is now in about 35 feet, and is crosscutting the ledge. The ledge has been stripped in four or five places and is from 90 to 100 feet wide. The ore carries copper and silver, and is low grade. The face of the tunnel is now in the best mineral they have struck so far.

ASSAYS OVER THREE HUNDRED OUNCES.—Rover Creek district has evidently other good properties besides the gold claims. The Mayflower, a claim located there about a month ago by Messrs. Casp, Mulvey, McKee, and Gentile, has a vein of galena from eight to ten inches wide—galena, too, that assays \$378.60 in silver and 60 per cent lead. The owners have laid in supplies for the summer and are going to do development work.

THE SMELTER.—*Nelson Miner*, June 25: The smelter at Revelstoke will be blown in as soon as the ore now sacked at the Number One mine, in Hot Springs district, can be got through to Revelstoke. The owners of the smelter have at last arrived at the conclusion that if the smelter is to be run, the ore must come from the Lake country.

MINOR SALES.—A half interest in the Ivanhoe, the second easterly extension of the Iroquois, was purchased by R. G. Tatlow of Vancouver, and the whole of the Balok by Richard Ashworth of Billings, Montana, for \$500. The former claim is in Tread Mountain district, the latter in Hot Springs district.

A CLEANUP.—The hydraulic company operating on 49 creek made a first cleanup last week. It was quite satisfactory, although the ground worked had been gone over last fall. Another cleanup will be made on Monday.

SOLID GALENA.—A mining man who recently visited Goat River district says the Alice is a fine looking prospect, with a ledge carrying fully 30 inches of good galena ore. It is understood that its owners hold it at \$50,000.

DAKOTA.

A BOOMING CAMP.—*Deadwood Pioneer*, June 20: State Inspector of Mines Corkhill returned from Silverton, the new mining camp, yesterday morning. He says that Silverton is the liveliest camp he has seen for years. Fully 200 prospectors are in the camp and more arriving daily. They came from every camp and town in the Hills as well as from Colorado, Utah, Nevada, Idaho and Montana. Claims are being staked in every direction, and the development in the Spokane warrants the excitement. The owners, Messrs. Juds, Schaler and Wright have eight teams hauling ore to the railroad for shipment. The ore is black sulphurets of silver and found in a true fissure. Its value is known only to the owners, but all old silver miners will recognize its worth. The same is found on two other claims, presumably extensions of the Spokane. A number of B. & M. officials and representatives are in the camp looking it over and getting interests where they can. The camp is on Battle creek, 10 miles from Hermosa, on the Elkhorn, and 14 from Hill City, on the B. & M. The route for a railroad is practical and easy of construction from either point. The most peculiar feature is that the Spokane ledge is paralleled by a rich ledge of tin ore. The present owners located the claim in the latter part of '90 or January '91 and immediately began work. No sooner had they found ore in paying quantities than Buckingham & Johnson, presumably in the employ of the Harney Peak Co., claimed to have located it and posted notices in '89 and again in '90, but no records of the fact can be found, neither are there any evidences of the necessary amount of work being done to make even a location valid.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, June 11: By all odds the best mine in Alamo is the Aurora. It is making its owners rich. The little five-stamp mill grinds away on rich soft rock day after day. The main vein is 7 feet wide, and so little troubled with water that a Swede with a cistern pump is all that is needed to get the water to the main pump, where the main steam pump works. The rock is so soft that a three-foot hole was drilled in an hour and a half. A fine piece of about two cubic feet taken out was reserved for the Columbian Fair, but it was accidentally broken. It showed streaks of the yellow as wide as a finger, which ran clear through the piece in layers. The San David shaft is down over 80 feet and drifting toward the ledge will soon begin. In the meantime the Princess mill is running on custom and tribute rock. The Placer mine has been furnishing it some very fine ore the past week. The Mountezuma mine and mill are very busy. The vein developed finely, and although the rock grows harder, it is also solid and less broken. A railway will be put from the mine to the mill pump if the mine improves. Newell's vein has been reopened, and tributaries are also working on Ulysses, Indio, Princess, Gold Tree and Telemaco ground.

OREGON.

THE GOLDEN CITY CO.—*Albany Herald-Democrat*, June 13: An important mining deal has been entered into by the Golden City Mining Co. and Mr. Richard Harrison of Denver, Colorado, which means a great deal for the Santiam mining district. Mr. Harris, who is a wealthy mining man, and is also backed up by other Denver mining capitalists, for the consideration of a block of stock in the Golden City, has agreed to put in a ten-stamp mill and a sawmill, wire-run tramway and other improvements, the cost of which will overrun \$50,000.

This contract means the development of the 20 valuable claims belonging to this company, and the bringing of a large working force into the mining district contiguous to Albany. Mr. Harris is a miner of experience and sound judgment, and, after prospecting the Santiam mines, pronounced them the best in the United States. The action is certainly one of importance for Albany. It will soon be followed by other movements upon other claims that will be of equal importance.

NOTES.—*Jacksonville Times*, June 19: The mineral resources of Southern Oregon are attracting much attention from a number of prospectors from abroad. Work has been resumed at the Swinden mine near Gold Hill by parties whom Dr. Braden has interested in the enterprise. Band & Denoff have finished cleaning up at the Miller mine on Farmer's flat, but made only a fair run, owing to the scarcity of water. The mines at Diamond peak, Klamath county, are attracting numerous prospectors already, and the indications are that it will prove to be a camp of importance. Most of the small placer mines have closed down for the season, but those operated by hydraulic process are generally running yet. The wet spring has greatly extended the season, much to the benefit of the miners. Since the discovery of the chrome deposit near Etna, two mineral claims have been located there, in order to secure control of the paint mine, which will doubtless prove valuable in time, the deposit being remarkably pure and free from foreign substances. The Patton ledge, located in Talent precinct, which was partially opened some years ago, but never extensively worked, has yielded considerable high-class ore since being leased last long since by Messrs. Hankett & Co. A yield of \$30 to the ton for surface ore is not to be sneezed at anywhere, especially when there is plenty of the rock in sight for a long run.

NEW MEXICO.

DEVELOPMENT WORK.—*Silver City Enterprise*, June 26: Chauncey Story, the owner of the old Castilian Turquoise mine near Bonanza City, recently got \$1000 for one nugget of turquoise. Wm. Elderton is moving the Thomas concentrator from Kelley to Patterson camp, Socorro county, where it will be set up and put in running shape. The Kingston Shaft is creditably informed, and from a source which ought to know, that there is no doubt of the early starting up of the Lady Franklin. It is rumored a deal is on hand to lease and bond the Maud S. at Silver creek. If the trade goes the hill will be started without delay and the claim will again be on the list of producers. John A. Miller and Frank Daly have gone to Carlisle. Frank will inspect a hoisting plant at Carlisle and if it is in good repair it will be removed to the Hobson group where it will be used in the development of that property. Regular shipments still continue from the new silver camp at Carlisle. The shipments seem to average higher than those of any other camp in the county, and so far almost every mine in the camp has more than paid for its development. A 5600-pound lot of the heavy zinc ores of the Pacific were recently shipped to Joplin, Mo. The ores contained over 17 per cent zinc and in addition to the cost of treatment, transportation, and mining netted \$38 per ton in gold and silver. At Gold Hill, Tom Foster has a bonanza in the new shaft on the Reservation. For a considerable distance above, and down to the bottom of the shaft there is a vein of free milling gold ore one foot in width, which averages \$180 per ton. The mill will be started immediately after the Fourth of July, and ore from the Reservation and other custom ores worked when the boys will have plenty of yellow eagles. H. McIntosh from Georgetown reports the camp as reasonably prosperous. Bragaw is working a good many men on his leased ground, and will soon start up the old Payne, Washington Co. mill on low-grade ores.

Mining Share Market.

The mining share market ruled dull throughout the past week, with a slight (about 10 per cent) recovery in prices. The tone is strong and healthy, although usually well informed operators look for lower prices sometime in this month, and then the starting of the deal. While lower prices, except in a few stocks, may not come, yet gudgeons who buy on a margin had best go slow, for if the pool succeeds in getting enough stocks on a margin they will inaugurate a bear raid and "scoop" them into their already well filled wallets or boxes. The mines were never before in so good condition for a big and successful deal as now, and that it will come is as certain as the sun will rise on tomorrow but it takes time to get it well under way. Those who have their stocks paid for and will pay one more assessment provided it be levied, will have no cause for regret in baving done so. The pool will unquestionably levy a line of assessments to get those gudgeons to sell at low prices, who invariably buy when the market is up.

In official circles it is claimed that Con. Virginia will declare a 50-cent dividend on the 15th of this month.

The assays of the Con. Virginia are being purposely reduced. This is part of the pool's game of bluff. While Con. Virginia is held up as an object lesson and the market worked according to its erratic movements, yet in the deal there are other stocks which will go much higher proportionately.

It now looks very much as if Com. Flood bought the wrong stock when he had his man "Friday" pick up Andes. Evidently he labored under the belief that the big development found to the west, in Con. Virginia is in the Andes ground, whereas it is claimed by the West Con. Virginia's, whose grounds are patented. Such is life, even the best get left by going too far west.

Pumping out the Gold Hill mines will receive a new impetus when the Alta pumps are started up. This starting up of the pumps by the Alta management has been looked for with keen interest by outside stock operators, for it was claimed that it would give new life to that end of the lode. The work was delayed until the Alta group pool and the Comstock pool got more mining shares. It is quite likely that the pumping operations will be made to do service in breaking stocks whenever the pool catches gudgeons with good lines on a margin.

The two stock boards adjourned over from Wednesday afternoon until Tuesday morning, July 10th.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 23, 1891.

454,586.—FERMENTING VAT.—U. Bachmann, S. F.
454,609.—PUMP.—Geo. Brown, Wausburg, Wash.
454,715.—AODING MACHINE.—D. L. Craig, Silver King, A. T.
454,638.—WATER WHEEL BUCKET.—W. G. Dodd, S. F.
454,679.—SAW SETTING MACHINE.—C. A. Erlandson, S. F.
454,821.—WAVE POWER MOTER.—H. P. Holland, S. F.
454,538.—APPARATUS FOR EXTRACTING GOLD ETC. FROM ORES.—Howe & Gates, S. F.
454,744.—COATING FOR FILES ETC.—F. E. Lamper, S. F.
454,616.—SASH BALANCE.—Benj. Marshall, S. F.
454,573.—ELECTRICAL PESSARY.—W. N. Sherman, Merced, Cal.

The following brief list, by telegraph, for June 23 will appear more complete upon receipt of mail advices: California—William N. Anderson, San Rafael, elevator safety device; Alpheus J. Bartlett, Pomona, sprinkler; Frank L. Bates, Sacramento, smoke consumer; Stephen H. Chase, San Jose, sawmill holder; Michael Dillenburgh, San Francisco, pipe coupling; John A. Driller, Los Angeles, separator, and Edmund L. Kenoyer, Hartford, equalizing device for windmills; Dr. F. Oliver, San Francisco, assignor to Acme Harvester Company, Peoria, Ill., hay rake; Albert A. and F. B. Stout, Fowler, valve for sinks and water-closets; Edwin F. Tucker, San Francisco, hot-air bridge; Dyson D. Wase, assignor one-half to E. W. Tucker, San Francisco, electric signal for steam vessels, Washington; John S. Griffin, Roslyn, casting machine; Samuel Griswold, East Davenport, wind engine.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FERMENTING VAT.—Ulrich Bachman, S. F. No. 454,586. Dated June 23, 1891. The object of this apparatus is to thoroughly ferment a liquid which for some reason has ceased to ferment by the ordinary process before all the sugar in it has disappeared. The fermentation of the liquid is a chemical process which is conducted by fermenting germs. These convert the sugar in the liquid into alcohol, carbonic-acid gas, etc. Under unfavorable circumstances these germs cease to act before the fermenting process is complete and consequently the sugar remains unfermented, and the liquid will lose in value. The main thing to which attention is to be directed is to conduct the treatment in a way to make it as favorable as possible for the growth and progress of the fermenting germs. There are, especially in wine-making, many causes for these germs gradually being destroyed. The only way to give this wine new life is to bring it in contact with new fermenting-germs. In this apparatus, in the center of a tank is placed a shaft having plates connected with it and the whole space inside the tank between the plates is filled up with a porous or absorbent material such as sponge, comminuted cork, etc.; grape stems will answer the purpose. The tank is filled with liquid which starts fermenting. The fermenting germs in this liquid will settle all over and into the pores of the porous substance, and will grow and multiply much more rapidly than when they are floating freely in the liquid, and therefore the fermenting process progresses more swiftly and thoroughly. By this action, the necessary fermenting germs are transplanted into the porous substance and consequently are contained in the machine, and if the proper temperature is maintained, then as long as the albumen and sugar are present the fermentation will progress. When the liquid has fermented sufficiently and is drawn off, the germs will remain in the pores of the absorbent substance. The apparatus can now be refilled with the faulty liquid, that is to say with a liquid in which for some reason the fermentation has stopped and will not proceed by any of the ordinary processes. Now if the proper temperature be kept up the germs will begin their work upon the faulty liquid and said liquid can thus be carried to the proper stage of fermentation. After continued use the apparatus can be washed, the water being agitated by the turning of the shaft. Increase or decrease of temperature can be obtained by pumping in cool or warm air by a means provided.

ELECTRICAL PESSARY.—Walter N. Sherman, Merced, No. 454,573. Dated June 23, 1891. This invention relates to that class of pessaries made of some yielding material and adapted to be carried to and left in place by a tubular carrier or cylinder having a plunger or piston. The invention consists of a peculiar disk or diaphragm adapted to receive a proper button or cup which is intended for healing purposes. It also consists, in connection with said disk or diaphragm, of a button constructed to generate a mild current of electricity for therapeutic purposes. The object of this invention is to provide a simple and readily applicable pessary adapted for the treatment of various womb diseases for which electricity is often recommended by physicians, also for the application of various medicaments and at the same time providing a useful support.

SASH BALANCE.—B. Marshall, S. F., assignor to the Marshall Improved Window Furniture Co. No. 454,616. This invention relates to that class of sash-balances in which a spring is employed and which operates a pinion engaging a rack. It consists in certain improvements in this class of device, and especially upon that sash-balance patented by the same inventor No. 420,425, Jan. 28, 1890. These improvements may be briefly stated to be the connection of the pinion and rack,

which while holding the two together permits the proper travel of the former upon the latter; the peculiar attachment of the rack; the location of the spring, when desired, in the sash-stile and the connections rendering this location practicable. The principal improvement lies in the connection of the pinion and rack. This is a positive one and is effected by means of a sliding sleeve. The object is to hold the two well together, notwithstanding shrinkage of the wooden parts, and yet to provide for the necessary freedom of the sash without liability of the disengagement of the rack and pinion. To this end the rack is suspended, thereby permitting it to have a slight swinging motion to conform to the movement of the attached pinion which is carried by the sash. This connection also makes of the device a single thing adapted to be readily applied as such.

CARTRIDGE LOADER.—Geo. B. Jacobs, Partial, Mexico. No. 454,578. Dated June 23, 1891. The object of this invention is to provide an efficient machine for loading cartridges of all kinds and sizes. It consists essentially of rotating magazines containing the materials with which the shells are to be loaded, directing chutes below for conveying these materials, a rotating holder for the shells which brings each shell into communication with the several chutes and reciprocating plungers or rammers operating on the charge in the shell. The several movements of the magazines, shell holder and rammers and plungers are effected by the operation of a single lever which vertically moves the central shaft or axis of the machine. The entire operation of loading is a continuous one, the shells being successively brought into position to receive the materials and to have performed upon them the necessary operations of loading.

SAW-SETTING AND NO. FILING MACHINE.—Carl A. Erlandson, S. F. No. 454,679. Dated June 23, 1891. This invention has for its object the filing and accurate setting of the teeth of saws by machinery. It consists of adjustable saw-holding clamps, cranks, guides and connecting rods by which the files are reciprocated, springs by which they are held down to their work, devices by which the files are adjusted to suit the angle of the teeth of different saws, a pawl mechanism to advance the saw as the filing of each tooth is completed, means for adjusting the throw of the pawl to suit the different spacing of the teeth of different saws, pins for setting the teeth of the saw and reciprocating burrs by which they are actuated, means for supporting the backs of saws having different taper and posts with vertical adjustment to suit the different widths of saws, together with many minor mechanical devices operating to produce these results, which cannot be intelligibly explained without engravings.

A Practical Business Educator.

Farmers alive to their interests are appreciating more and more the necessity of a business education, to enable them the better to cope with merchants and others in the struggle for the necessities of life. Perhaps no institution offers better facilities for the securing of a business education, in all its practical bearings than does the Pacific Business College of this city. An exchange very aptly states that "the value of a good education can scarcely be over-estimated. To the young man entering upon the active duties of life, a practical education is of prime importance. It is his stock in trade, by means of which he may lay the foundation of future prosperity and independence. A thorough business education, such as can be had at the Pacific Business College, is always available capital, and is of inestimable value to any one starting out in the world, with its prizes to win by knowledge, skill and capacity, or to lose through ignorance, incompetency and neglect. Prof. T. A. Robinson, the president, is one of the best teachers on this coast of mathematics, book-keeping, and the various branches of commercial sciences, as the hundreds of young men who have been so fortunate as to receive instructions from him can bear testimony. The several courses of instruction are thorough and practical, the halls and recitation-rooms are large, well lighted and well ventilated, and every facility for comfort and advancement is provided without regard to expense."

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their San Francisco Patent Agency (S. F.) from week to week and year to year.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE Los Angeles electric bell railroad has commenced operations.

MECHANICAL PROGRESS

How Aluminum Is Made.

More than ordinary interest attaches to the subject of the production of aluminum because of the rapid strides which have been made in cheapening its mode of manufacture within the last few years. The gradual evolution of this manufacturing process has reduced the cost of this remarkable metal from \$91 per pound, which was its cost in 1885, to \$1 and less per pound—its present price. Some of the devices by which this cheapening process has been brought about have been patented; other alleged processes are kept profoundly secret from both the patent office and the world. The June number of the Proceedings of the Massachusetts Institute of Technology contains a paper upon the above subject by Mr. Alfred E. Hunt of Pittsburgh, in which the writer describes the Hall process of manufacture, which is employed by the Pittsburgh Reduction Company and the one in which electricity plays the chief part.

This process, according to Mr. Hunt, consists in electrolyzing alumina, dissolved in a fused mixture of fluorides of aluminum and sodium, or fluorides of aluminum and potassium, or of fluorides of aluminum, together with the fluoride of any metal more electro-positive than aluminum.

The mixture of fluoride salts is first placed in a row of carbon lined iron tanks placed in series. The pots containing the reduced metal in the carbon lining then become negative electrodes or cathodes. The positive electrodes or anodes are a series of three-inch carbon cylinders attached by three-eighth inch copper rods to the copper conductors by means of binding screw clamps. A current of 5000 amperes and 50 volts in one series and of 2000 amperes and 20 volts in the other series is turned on, and the mixture is melted by the heat caused by the resistance offered to the current by the fluoride mixture.

In less than two hours' time the mixture becomes fluid, and alumina is added, when the electrolyte becomes a much better conductor and "the resistance of the pot" goes down to a normal one of about eight volts. Then the process of electrolysis begins. The alumina in the solution is decomposed, and the metal, being heavier than the electrolyte, sinks to the bottom of the pot. The oxygen goes to the positive carbon electrode, uniting with a portion of the carbon and escaping as carbonic acid gas. The heat is retained in the molten bath by a covering of finely powdered carbon spread on its surface. On the top of this carbon the powdered aluminum is placed, and when the volt meter attached to each pot shows a rising resistance, more heated ore is stirred in from the surface, the carbon soon rising to the top. The feeding is thus made easily continuous, being run, in fact, for months at a time. The advantages asserted for the slow and continuous feeding are purity of the metal, saving in loss of metal and economy in heat.

Commercial aluminum, writes Mr. Hunt, is never chemically pure, silicon and iron being almost always found. For many purposes the purest aluminum cannot be so advantageously used as that containing three or even four per cent of impurity, as the pure metal is very soft and less strong than the impure. It is only where extreme malleability, ductility, soundness or non-corrodibility is required that the pure metal should be chosen. Stiffness and hardness are very much increased by cold hammering, cold rolling, drop forging and other processes. Sound castings of aluminum can be readily made in dry sand molds.

A GOOD MACHINIST.—A correspondent of the *American Machinist* says: "There is a good deal of difference between being a good machinist and 'knowing the machinist's trade thoroughly.' I have been in the business 30 years, but don't know it thoroughly yet, and don't ever expect to; but I hope I was a 'good machinist' 25 years ago. There is so much that is new constantly coming up that one man cannot grasp it all. The best one man can do is to be called a 'thorough machinist,' which means that he is able to study up ways and means for well and economically doing such work as falls into his hands. Give him a forging or a casting and a drawing, and the thorough machinist can see in the rough metal the finished work, just as the sculptor can see the perfect statue in the rough block of marble, and knows just how to strike with mallet and chisel to bring out the perfect work of art. Just so the 'thorough machinist' can see the finished work, and his machinist's instinct and training tell him how to set at work the shop tools to get out of the rough iron the finished work. And so it goes; some young men can make themselves into good machinists in six months, some in twelve months, some in two or three years, and some will never get there with the traditional seven years' apprenticeship, and had better do something else; but of all the different kinds, give me the six months man. He is the one who was 'horu a machinist,' and he will continue to learn and become more valuable all his life."

EVOLUTION OF THE KNIFE.—"This case full of implements which we have newly placed on exhibition is designed to show the development of the tool which we call the knife, beginning

from the earliest times," said Prof. Mason at the National Museum to a Washington *Star* reporter. "First, you observe, is the fragment of flint which the savage split by hanging it on the top with a stone hammer into a number of flakes. The smaller ones were used for arrow points and the bigger ones for knives, their edges being split off so sharp that you might almost shave with some of them. Next you see the flint flake fastened into a handle of split wood or bone, and, as further improvements, the fastening of this primitive knife in the handle by the resin of trees and by cord of one sort or another bound round to secure it. The most beautiful knife in the collection is the exquisitely molded blade of greenish jade belonging to the stone age handed with a walrus tusk. You can hardly find a more admirably formed weapon among the products of modern cutlery wares. Most curious of the modern tools here is the sailor's knife, square at the end instead of pointed, to prevent stabbing in a row or the dangerous falling of the weapon from aloft. Its blade drops out at the end of the handle when a catch is touched, so that Jack can hold a rope with one hand and open the knife for service without the need of ten fingers."

Expansion of a Long Steam Pipe.

Several months ago, a careful determination of the expansion of a long steam pipe was made by direct measurement at the University of Minnesota. The pipe was laid in a brick-walled trench, or conduit, supported on rollers, and the experiment was made before covered up. This was a four-inch wrought-iron steam pipe, the part measured being a straight section 210.6 feet long, terminating at each end in an elbow.

The length was first accurately measured (between two points marked on the inner face of the elbow flanges) by means of a standard steel tape.

At each end of the pipe, a strip of iron was built up in brick piers, so that the strip passed over the top of the pipe, a few inches inside of the elbow flange, with which it was parallel. The strips were stationary and entirely free from the pipe, so that by calipers the distance between a strip and the flange, before and after heating the pipe, the movement at the end could be accurately measured. This operation was, of course, gone through with at the other end as well, the sum of the two giving the total elongation.

The measurements were taken between three and four P. M. of a cool, cloudy day, and as the temperature had been very constant for several hours, it was assumed that the temperature of the pipe was the same as that of the air in the conduit, viz.: 43° Fahrenheit. Having taken the initial measurements of this temperature, steam was turned on and allowed to remain until no further expansion was observed. The temperature was read by a good thermometer and checked by a steam gauge, both inserted in the pipe. The average temperature was taken at 300 degrees, making the range of temperature 300—43=257 degrees. The elongation of pipe was found to be 2.28 inches at one end and 2.17 inches at the other, giving a total expansion of 4.45 inches.

This means that the expansion per degree Fahrenheit was .00000635 of an inch per inch of original length, or the same fraction of a foot for each foot of the original length, etc. This is equivalent to an extension of .00822 inches in each 100 feet of original length, per degree, or to a linear expansion of 1.48 inches (nearly) per 100 feet, in changing the temperature from 32 to 212 degrees.

VARIETIES OF TAP CINDER.—This subject which is of much importance to iron manufacturers, has received attention at the hands of Mr. Thomas Turner, the well-known lecturer on metallurgy at Mason College, Birmingham, and he has presented a first abstract of the results of his tests to the South Staffordshire Institute of Iron and Steel Works managers. For his experiments Mr. Turner obtained samples of boilings and tappings, both taken from the same heat, from various works during ordinary working with different irons. The samples were broken up and passed through sieves, being examined by eye, and with a moderately powerful magnet for globules of iron. It was found that all the boilings yielded globules of metallic iron, while none were met with in any of the tappings. The boilings yielded as much as 16 per cent of metallic iron—hence such a slag would mean a preventable loss of 3½ per cent of puddle bar, or equal to \$2500 a year on 300 tons of puddled iron per week. All the tests showed that the boilings were distinctly more impure than the tappings, and the analyses made by Mr. Turner show that for economical puddling it is necessary to hold away a considerable quantity of the first impure cinder so as to be able to obtain a pure tapping cinder with the use of the smallest possible quantity of fettling.

WASTEFULNESS OF STEAM HAMMERS.—To obviate the notorious wastefulness of steam hammers an improvement has been introduced at the Chemnitz Works, in fitting the hammers with two platens of different diameters, compounding them, in fact. The top is raised by steam at boiler pressure acting on the under surface of the smaller platen; and this steam, on expanding, adds to the force of the blow by acting on the upper surface of the larger platen.

SCIENTIFIC PROGRESS.

The Next Advance in Telescope Making.

Why, asks the *Pall Mall Budget*, is it so difficult and expensive to construct an immense telescope? From the time of Galileo to that of Clark, steady work has been done, and each step has given us a larger object glass. The pupil of the eye is one-fifth of an inch in diameter, and can grasp but a limited amount of light. A 25-inch object glass will enable the eye to take in over 15,000 times more light, and with such a glass the moon can be seen as though it were only 80 miles away; but if the size of the object glass could be further increased, the moon would be brought considerably nearer. To make a large object glass is the difficulty, and it is only after years of patient work of the most skilled men on earth and after repeated attempts that one can be produced which is accurate. Slight differences of specific gravity, changes of structure due to jarring, strains resulting from unequal pressures and changes of temperature, are all capable of ruining the work. Some one who is anxious to anticipate events has asked: Why not replace the glass, which is only a medium transmitting light at a different velocity from air, by a properly constructed electric field? It is conceivable that an electric field 50 feet in diameter could be arranged. Just what the nature of this field should be, with our present knowledge, we cannot say, but some day it will be known, and then the secrets of the other planets will be ours. Either (says a technical paper) is now paramount with experimentalists; some day it will form the basis of all electrical text books. We seem to be on the verge of discovering something really great in the world of ether. The early experiments of Faraday, the marvelous mathematical researches of Maxwell, and the crowning experiments of Hertz, all show the intimate relations which exist between electricity and light. They have so entirely changed our views of science that it has been truly said that electricity has annexed the whole domain of optics.

Can Monkeys Talk?

In our issue of January 31, an article appeared under the head of "The Language of Monkeys," in which a somewhat extended notice was given of a very interesting study, which was being prosecuted by Prof. R. L. Garner, of the Smithsonian Institute, in regard to the language of monkeys. The professor had already become satisfied that the monkeys were in possession of a language that was understood by themselves, and which he thought he would eventually be able to so interpret that it might be also understood by man. The professor has continued his investigations with what he evidently considers a marked degree of success. Quite recently he has written to the *New York Herald* that his investigations of sounds made by monkeys convince him that they articulate speech from which the tongues of mankind could have been developed. They use their lips very much as men do.

In his investigations he makes use of the phonograph, and says: "The monkey tongue has about eight or nine sounds which may be changed by modulation into three or four times that number. They seem to be half way between a whistle and a pure vocal sound, and have a range of four octaves, and they all chord with F sharp on the piano. Faint traces of consonant sounds can be found inwards of low pitch, but they are few and quite feeble, but I have had cause to believe they develop in a small degree by a change of environment. In their present state their speech has been reached by development from the lower form. Words are monosyllabic, ambiguous and collective. Having no negative terms, except of a resentment phonic character, their speech is very much the same as that of children in their early efforts to talk, except as regards pitch. Their language seems to obey the same laws of change and growth as the human speech."

A SUBMARINE BOAT. says a contemporary, is being built in which enough air can be stored to sustain two men 24 hours, using electricity as a propelling power. Why use "stored" air when the water in which the boat is submerged contains an abundance of free air to last "two men" an indefinite length of time? A very small tank with a fine sprinkler attachment, by which a spray of water from the outside can be thrown into the interior of the boat at intervals, would not only afford an abundance of pure air for the occupants, but would also absorb the carbonic acid gas contained in the vitiated air. A very small area of the propelling power would be sufficient to force the water so admitted, back to the exterior. Experiments in this direction with diving bells have shown that this method is perfectly practical. Some absorbent of the carbonic acid gas must be employed where compressed air is used. Why not make use of water for both purposes?

A GLASS FIRE BLOWER.—Everybody dislikes the iron fire blower, which we have to put up in front of our grates to start the fire. What promises to be a great relief in this direction is a glass blower which has been invented by a New Yorker. The blower rests against the rear

surface of the side posts of the mantel, and is held across the upper part of the fireplace opening, while its lower edge is sustained in hook clips fastened to the wall or the uprights of the mantel, and its upper edge in a stud or clip fastened to the fireplace wall. By these means the blower is always held to the fireplace loosely, so that it can readily contract or expand without danger of fracture. With a blower of this kind the fire is visible, and the room will always be lighted by the fire whether the blower is in use or not.

IS CULTURE HEREDITARY?—Prof. Lester F. Wood says that the whole point at issue is whether there is a causal relation between the cultivation of the mental faculties and their development; in other words, whether the increment gained by their exercise is transmitted to posterity. Prof. Weismann and most of his followers, constituting what is now generally known as the school of Neo-Darwinians, deny such transmission. If they are right, education has no value for the future of mankind, and its benefits are confined exclusively to the generation receiving it. So far as the inculcation of knowledge is concerned, this has always been admitted to be the case, and the fact that each new individual must begin at the beginning and acquire all knowledge over again for himself is sufficiently discouraging and has often been deplored. But the belief, though vague, has been somewhat general that a part at least of what is gained in the direction of developing and strengthening the faculties of the mind, through their life-long exercise in special fields, is permanently preserved to the race by hereditary transmission to posterity of the acquired increment. We have seen that all of the facts of history and of personal observation sustain this comforting popular belief, and until the doctors of science shall cease to differ on this point and shall reduce the laws of heredity to a degree of exactness which shall amount to something more like a demonstration than the current speculations, it may perhaps be as well to continue for a time to hug the delusion.

DIVORCING LIGHT FROM HEAT.—Professor Langley has shown that our best sources of light are surpassed by nature in one very important respect—the production of light unaccompanied by heat. Of the energy supplied by gas and oil for lighting purposes, much more than 99 per cent is given out in heat. Even in the electric arc light the waste is 90 per cent, and in the incandescent lamp 95 per cent. The insect world is much more economical. The most careful measures made with the delicate bolometer fail to show any sensible heat in the light of the firefly. There is no reason why nature should not be successfully imitated in this respect, and Professor Hertz hopes to devise a method of obtaining better results than we now do, from our present ordinary means, in getting electrical vibrations similar in every respect to those of light, but of greater wave length. By modifying his original apparatus, he has some prospect of producing waves so much shorter than all of them will be luminous; in other words, of developing a new source of light without heat. This result, if successful, will be an entirely new method of illumination differing as widely from the present electric lights as they do from gaslight and lamplight, and surpassing them all in economy and comfort.

IRIDESCENCE IN TABLE GLASS.—It appears that the iridescent film is slightly soluble in water, and what is left of it easily yields to the solvent action of caustic soda, while it is not affected by the action of strong hydrochloric acid. When the solutions in water and in caustic soda are examined, it is found that these solvents have taken up sodium sulphate acid and carbonic acid. The portion of the film that is insoluble in the acid can only be silica, for even the spectroscopic will not reveal the presence of lime. The iridescent film is usually found associated with one side only of the glass, and it must be formed during the final heating of the ware. It is probably caused by the action of the sulphurous acid which exists in the burning gases. This acts upon the surface of the glass, forming sodium sulphate and silicate. The latter is afterward decomposed, when free silica separates out in an amorphous form, and this is that portion of the film which resists the action of the hydrochloric acid, and is dissolved by the caustic soda.

There is now being finished at Greenville, Pa., a disk of glass for a refracting telescope lens, which is claimed as the largest that has ever been made in the United States. The disk is 30½ inches in diameter by 5½ inches in thickness, and weighs over 300 pounds.

A POSSIBLE SOURCE OF DANGER.—It is found that the "sparking" visible when switches are turned on or off—to say nothing of that seen at dynamo brushes—will ignite the ordinary vapor given off by petroleum.

EFFECT OF THINKING.—An Italian physiologist of repute, named Mosso, has demonstrated by experiment that thinking causes a rush of blood to the brain, which varies with the nature of the thought.

AZONE FOR RESTORATIVE PURPOSES.—An English physician has invented a cabinet for the generation of ozone for restorative purposes. The ozone is produced by electricity,

GOOD HEALTH.

A New Disease of the Strawberries.

According to the Philadelphia Record, a comparatively new disease has made its appearance in the Quaker city.

"Strawberry rash" is the name given to the epidemic which has appeared this season to an unusual extent. Physicians claim that while the disease, which takes the form of a rash, has in previous years made its appearance at this season, never before has it been so prevalent. The rash attacks the skin, which breaks out in large red blotches similar in color to the berry from which it takes its name. It is no respecter of age, attacking young and old alike.

"There is no known cause for the ailment," said Dr. J. C. Wilson, when approached upon the subject. "I, myself, am subject to it, and in consequence am obliged to refrain from eating strawberries. I don't know why some people are subject to it and others are not, any more than why some people are liable to catch rheumatism or any other disease, while other people, under the same circumstances, are exempt. I only know that the rash exists, but I don't know why."

All over the city people are suffering from the effects of the insidious berry. In several cases whole families have it. While not interfering with the general health, it is accompanied by an itching sensation that renders it annoying in the extreme. Many people are ignorant of the cause of the suffering. Others, having heard of the existence of strawberry rash, have tabooed the berry, and find themselves benefited by abstaining from it.

Physicians unite in saying that the rash has never before appeared to such an alarming extent. Nearly all the doctors in the city have several cases on their hands, and there are many instances which have failed to come under their notice. In every instance where the patient has stopped eating strawberries the rash has greatly diminished or entirely disappeared. Whether there is any germ of the disease in the berries which have come to this market is a matter of conjecture.

INVESTIGATING LEPROSY.—The rapid increase of leprosy in India has induced physicians there to make a special study as to its origin, and, if possible, cure. It is now said that the Commission of Investigation, which was some time since appointed in Allahabad, in North-west India, have succeeded in isolating and cultivating the bacillus of leprosy. They accomplished this in an artificial medium, consisting of bouillon and gelatine, with which they inoculated a rabbit. The animal speedily developed leprosy nodules under this treatment. This is the first time the bacillus of the terrible disease has been successfully grown outside the human subject, it is not improbable the researches and experiments of the Commission will lead to exceedingly interesting, if not wholly practical results.

This committee is preparing a report which, it is said, when printed, will prove very interesting reading to the medical fraternity. It will present the most complete, scientific study of the subject ever given to the world. The Commission, which is composed of medical experts, has visited leper hospitals and studied the condition of lepers in prisons, in streets and in some of the isolated places. Every part of India where leprosy prevails has been locally studied with a view to ascertain how far the conditions of environment assist in propagating the disease. Some thousands of cases have been examined. Microscopic researches made into the distribution of supposed bacillus of leprosy and a series of bacteriological investigations were conducted which are said to have given astonishing results, promising a cure of this hitherto irremediable disease.

IS EGYPTIAN CORN POISONOUS?—No little excitement has been created in the vicinity of Red Bluff during the past few days, growing out of the poisoning of a large number of cows which had been feeding upon growing Egyptian corn. A Mr. Wilton first lost 30 cows, who died almost immediately after eating the corn in the field. At first it was thought poison had been maliciously or otherwise scattered upon the corn, but a day or two afterward under sheriff Fish of Red Bluff lost two cows in the same manner several miles from the locality of the first case; and now comes a Kansas man who says that Egyptian corn will kill cattle very suddenly if eaten at certain stages of its maturing growth. The case is an interesting one and should be carefully inquired into.

KOCH'S LYMPH.—Late reports from Portland, Oregon, state that Koch's lymph is no longer an experiment, for two patients who were given the treatment in St. Vincent Hospital have been discharged cured. The physicians are surprised with the success of the remedy, and believe that the lymph is a specific for tuberculosis if given the patient in time. It is a significant fact that only in these two cases were the physicians satisfied that the disease was genuine tuberculosis. In the other cases undergoing the treatment they have thus far been unable to discover any bacilli. Eastern papers state that important improvements have recently been made in the manufacture of the lymph.

STEAM BOILER NOTES

What Should a Boiler Be?

In considering the points of a horse, any one who is well posted will tell you at once that he should have a wide forehead, fine muzzle, large nostrils, oblique shoulder blade, long and muscular forearm, broad nose, flat cannon bones, deep chest, short back, etc. Every horse lover has the good points of a horse "down line." But with such an important matter as a boiler, who knows the desirable points, or can repeat them off hand?

But the desiderata of a boiler has been or can be formulated, and it should be interesting to note what they are.

In the first place, it should be safe. Then it should be simple, convenient to get at, around and into; easy to handle and repair; compact; quick to steam, constant in its circulation, and steady, too; free from smoke, able to work with any kind of water, good, bad, or indifferent; and dry steamer; and, of course, economical of fuel.

In order to be all these things, the heating surface must be so arranged as to heat take the heat from the gases of combustion, and so as also to let the steam which is generated get away from those surfaces as rapidly as possible. It must be strong enough to stand any pressure that can be got in it by fair means; and should have a safety valve which will let off all the steam that can be generated in it, even if none is being drawn off. There must be no place where unequal expansion will make the boiler its own enemy. It must be saving of fuel, not only at some one rate of steam production, but at the regular rated capacity; and while it cannot be expected that a boiler will do as well with bad fuel, bad water and bad firing as with all these three good, it must be economical with all three bad.—*Power and Transmission.*

FOUR CYLINDER ENGINES.—The introduction of the new triple expansion engines, having four cylinders, into the large mills at Fall River has proven a success, according to the New York Sun, which in describing the engine says: "It is a triple-expansion engine, with four cylinders. The steam, instead of being carried to a single large cylinder for its final expansion, is divided between two, whose combined capacity is such as to bear the required proportion to the intermediate. The high-pressure cylinder, with one of the low, is upon one side of the engine, and the other low pressure, with the intermediate, upon the other, the crank being set at an angle of 90°. This secures for the engine an equal distribution of the load between its two sides, when, as will normally be the case, the work done in the high pressure and intermediate cylinders is equal. The cylinders are proportioned as follows: High pressure, 20 inches in diameter; intermediate, 34 inches; and two low pressure, 36 inches each, the stroke being 60 inches upon each side. The cylinders are steam-jacketed all over, heads as well as barrels, and the steam passes through these jackets on the way to the cylinders. The satisfactory results of this arrangement would seem to admit of no doubt, judged by the published figures; that is, tests show that the engine develops its load of about 1000-horse power upon an average consumption of 1455 pounds of coal per horse power per hour."

BANKING FIRES.—The fire in a boiler was banked over night, and during one evening a considerable portion of the water leaked out. In the morning, the fireman stirred up his fire, and then noticed there was no water in sight, and, considerably frightened, he drew the fire and waited for the engineer, not daring to put in water. The engineer did not get excited, but took a piece of waste, wet it well, put it on the end of a poker and rubbed it over the boiler-plate and appeared satisfied. "What do you do that for?" inquired the fireman, and from the engineer's reply he gathered that if the plates were overheated, the water left by the wet piece of waste would show it by quickly evaporating; but if they were not overheated, the water would remain on the plates.—*Ex.*

THE CONDENSATION OF STEAM IN PIPES.—It is sometimes convenient for an engineer to be able to approximate the amount of condensation that will take place in pipes during a certain length of time. From many experiments made on the condensation of steam in wrought-iron pipes, when exposed to the open air, it is found that one pound and six ounces of steam per square foot of pipe's surface was condensed per hour when the difference in temperature between the steam and air amount to 200°. As this is very nearly the difference of temperature usually found between the steam in the pipes and the air on the outside, this simple rule will give results sufficiently close for ordinary purposes.—*Stationary Engineer.*

FORCING BOILERS.—One very important cause of deterioration in boilers is due to the fact of their becoming too small to do the work without forcing, so that the pulsation of the engine causes a well-marked succession of shocks on the boiler, which result in the weakening of the material. By placing one's hand on the head or shell of the boiler, the vibrations of the metal can be felt, similar to the rising and falling of a man's chest while breathing.—*Exchange.*

ELECTRICITY.

A Competitor for Edison.

Mr. Frank Hartman, a real estate man of Denver, has been working for several years upon the same line more recently taken up by Mr. Edison—the invention of a device which shall be a combination of the phonograph and photographic camera. The idea of both Edison and Hartman is to produce an instrument which will record and reproduce all forms of motion, such as a horse race, game of baseball, operatic performances, street scenes and the like. It does with light what the phonograph does with sound, and by coupling the two instruments it is possible to reproduce a scene showing, for example, an orator delivering a speech with all his gestures and motions, and at the same time hear everything he says, together with the cheers and applause. A play upon the stage may also be so perfectly recorded, that every motion and every word of the different actors may be reproduced in form, manner and speech as perfectly as the best phonograph now records the speech only.

Mr. Edison calls his device a "kinetograph"—a recorder of motion. Mr. Hartman denominates his device a "zotograph," or more plainly, "a seeing machine." The word is from *zo*, flight, and *graph*, to write—recording a flight or movement so that it can be seen.

It would appear from the information before us that Mr. Hartman has been for some time in communication with the patent office, securing his various devices as he progressed, which appear to be very much in character with those of Mr. Edison.

Mr. Hartman's attention was first called to the subject by viewing and studying the productions in rapid photography and the manner in which they were produced by Mr. Maybridge of this city, the apparatus to accomplish which is said to have cost some \$30,000. It has been the study of both these gentlemen to improve upon that process, and to add to it a clever attachment of the phonograph, by which sounds as well as motions could be simultaneously recorded for later reproduction.

The Commercial Value

Of this invention, perhaps, may not be very great, but it will be useful nevertheless. The zotograph will see everything within its range and record the same automatically and correctly. Placed in a car window, it will photograph everything which comes within its range as the car moves along. It will also record the babel of sounds as they pass by. It will record even the slightest progressive movement of a horse in its complete race around a track. All the motions of an athlete, or several of them, may be accurately recorded. Every great parade, every noted assemblage, with their continuous actions and movements, may be recorded upon the sensitive plate, so that those in after time may see them as fully and as perfectly, only considerably enameled, as did the original witnesses. Mr. Edison expects to fix upon the sensitive plate motions as rapidly as 46 per second. Hartman, in his caveat recorded long before anything was heard from Edison in this direction, claims a speed of from 50 to 100 per second, which will make the record appear as if actually in motion, as indeed the picture may be made to move before the observer.

Both these inventors are working more for the love of the thing than for profit, and it is to be hoped they will each realize the fullest hopes of their most sanguine imaginings. Although both are striving for a common end, the means by which they are striving to reach it are somewhat different.

The device, when perfected, will be something more than a scientific toy. It will be a delight for children and an instruction as well as a delight for adults. It will give to public speakers, actors and singers the gift so earnestly desired by the favorite Scotch bard when he sang:

Oh! wad some pow'r the giftie gie us,
To see ourselves as others see us."

A NOVEL IDEA.—At Lawrenceburg, Ind., a novel use was made of electricity in winding wires around a pretty woman who represented the Goddess of Liberty, and thus in lighting up a number of incandescent lamps disposed about her. The current was obtained from the street mains, and the effect elicited the most enthusiastic applause from the spectators.

The work of building the electric road through various streets in this city into San Mateo county to Baden and Redwood City is being pushed rapidly. The poles are now erected past the Seven-Mile House and county line and the men are now at work placing them in San Mateo county on toward the new cemetery.

The use of electricity in mines bids fair in five or six years to far exceed its use in electric street railroading. Such is the opinion of one of the best authorities on the subject.

THERE is now being built at the Thompson-Houston Works in Lynn an electric freight locomotive, which is to weigh ten tons and to be of 60-horse power.

REPRESENTATIVES of the Hayward electric road are securing subscriptions from property owners along the route, and are meeting with success.

USEFUL INFORMATION.

HIDING GOLD IN INDIA.—It is very generally known that large quantities of silver are annually hidden away in India, but it is not so well known that more later they have been laying away gold there. An English writer says that a considerable part of all the gold that goes to India never returns. Having been obtained in the west by the sale of exported productions, it is retained in the east as realized profits, wealth stored up, and, to a moderate extent, for use in the arts; for the rest, as a representative of value on the credit of which traders buy and sell with the bills of exchange they issue and the book credits they open, and settle up the differences with the silver money of the country. But the vast stock of gold accumulated there undergoes no diminution; there is no ebb and flow under the reciprocal action which commerce enforces in the case of countries trading together on a common metallic basis. The three million sterling or thereabout of gold bullion which India annually adds to her store are, under the monetary law of that country, just as much lost to the nations of the west, by being withdrawn from the general commerce of the world, as if the money had been lent to a south American republic. Between the years 1835 and 1889 this depletion amounted in value to £130,292,758.

DIFFERENT KINDS OF GOLD.—"Most people suppose, says an assayer, 'that all gold is alike when refined, but this is not the case. An experienced man can tell at a glance from what part of the world a gold piece comes, and in some cases from what part of a particular gold district the metal was obtained. The Australian gold, for instance, is distinctly redder than the California, and this difference in the color is always perceptible, even when the gold is 1000 fine. Again, the gold obtained from the placers is yellower than that which is taken directly from quartz. Why this should be the case is one of the mysteries of metallurgy, for the placer gold all comes from the veins. The Ural gold is the reddest found anywhere. Few people know the real color of gold, as it is seldom seen unless heavily alloyed, which renders it redder than when pure. The purest coins ever made were the \$50 pieces that used to be common in California. Their coinage was abandoned for two reasons: First, because the loss of abrasion was so great, and, secondly, because the interior would be bored out and lead substituted, the difference in weight being too small to be readily noticed in so large a piece. These octagonal coins were the most valuable ever struck."—*New York Tribune.*

A NEEDFUL INVENTION.—A recent invention is a device for automatically shutting off the gas when it has been blown out, instead of being turned off in the usual way. The principle upon which the invention is based is the expansion and contraction of a metallic loop made of German silver and steel, and which is adjusted very close to the gas flame. One end of the loop is free, while the other is secured to the fixture. A valve controlling the gas is attached to the free end, and when the gas is burning the valve is open and the gas freely escapes. If, however, the gas is blown out, the loop will quickly cool and contract, and the valve will shut off the gas. It is said that the device is exceedingly simple, and it responds quickly to the change in temperature.—*Fire and Water.*

A DISAPPEARING INK.—An ink which, according to the *Effective Advertiser*, seems to be identical with the disappearing ink of about 20 years ago, has recently been placed upon the European market, and is a watery solution of iodine and amylin. It produces a beautiful blue black writing, which begins to fade after a few days, and disappears entirely after the lapse of a week.

COPPERING IRON.—A process has been recently invented by which iron may be coppered by dipping it into melted copper, the surface of the iron being protected by a layer of melted cryolite and phosphoric acid. It has been found that if the article, when immersed, is connected with the negative pole of a battery, the coppering is done more rapidly.

WHAT ONE BLAST DID.—The papers have lately mentioned how many prominent mines of the country were discovered by chance. There is a scrap to be added in the history of the Cortez mines. Simeon Wenban had run the Garrison tunnel at great expense and was left a poor man, owing his creditors \$150,000. There was not a pound of ore in sight whereby the debt might be paid. As a last resort, with a forlorn hope, after the mine had been closed, Simeon Wenban drilled a hole in the hanging wall and blasted out a huge piece of rock, which he found to be almost a solid block of metal, and part of an immense vein which had been paralleled hundreds of feet. This fortunate last effort marked a sudden change that seldom falls to the lot of man. It was Wenban, the poor man, the laborer, before that blast was fired; it was Simeon Wenban, the millionaire, but a second thereafter. The first month's run of his little mill gave him \$30,000, and ever since he has grown more wealthy. The mine is the best paying property in the State at the present time.—*Central Nevada.*

TABLE OF CONTENTS.

EDITORIALS.—Tuscarora, Nevada; Passing Events; California Minerals at Chicago; Tin Plate; Extracting Gold and Silver; Miscellaneous. 8. Washington; The Flood in the Desert, 9.

ILLUSTRATIONS.—Navajo and Independence Mill; Grand Prize Mill, Tuscarora, Nevada, 1. The Washington Monument at the National Capitol, 5.

CORRESPONDENCE.—The Golden Era Mine; California Mining Int. tests, 2.

MISCELLANEOUS.—Curious Facts About Seas; Oceola District; Electric Power for Pumping, 2. About Mineral Land Claims; Washington Iron; The Public Domain; Natural Gas at Stockton; A New Enterprise; Laseen Irrigation; Cleaning Gold Off Copper Plates; A Lixivation Plant, 3.

MECHANICAL PROGRESS.—How Aluminum is Made; A Good Machine; Evolution of the Knife; Extension of a Long Steam Pipe; Varieties of Tap-Cinder; Wastefulness of Steam Hammer, 6.

SCIENTIFIC PROGRESS.—The Next Advance in Telescope Making; Can Monkeys Talk? A Submarine Boat; A Glass Fire Blower; Is Culture Hereditary; Divorcing Light from Heat; Irresidence in Table Glasses; Miscellaneous, 7.

GOOD HEALTH.—A New Disease of the Strawberry; Investigating Leprosy; Is Egyptian Corn Poisonous? Koch's Lymph, 7.

STEAM BOILER NOTES.—What Should a Boiler Be? Four-Cylinder Engines; Banking Fires; The Condensation of Steam in Pipes; Forcing Boilers, 7.

ELECTRICITY.—A Competitor for Edison; A Novel Idea, Miscellaneous, 7.

USEFUL INFORMATION.—Hiding Gold in India; Different Kinds of Gold; A Useful Invention; A Disappearing Ink; Disappearing Iron, 7.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 4.

MINING STOCK MARKET.—Sale in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc. 12.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc. 12.

Business Announcements.

Passing Events.

California has experienced this week the hottest weather in 40 years, and several cases of sunstroke are recorded, a very unusual thing in this State, where the air is so dry. The thermometer has registered 100° in this city, and considerably higher in the interior.

The influx of water to the salt fields in the low place of the Colorado desert is looked upon almost as a phenomenon, large areas being inundated that have always been dry since the settlement of the country by white people. The region is over 200 feet below sea level, and the water is supposed to be from the Colorado river, coming by seepage through the sands of the desert.

The increased tin-plate duty went into effect on July 1st, and we must now pay \$2.37½ per box of plate. It is the hope of the political economists that this will stimulate the production of tin plate in this country, the raw tin itself coming in free. As yet, however, there are no tin-plate mills at work, and an immense stock of tin plate has been shipped to this country.

On the 1st inst., the new law regarding coinage of silver went into effect, and the local Mint has stopped the coinage of that metal for the present.

LAST Monday was the hottest day in forty years in San Francisco.

California Minerals at Chicago.

On June 20th an editorial was published in the MINING AND SCIENTIFIC PRESS suggesting that, in order to make a display of minerals at the World's Fair, to excel all others in the United States, the extensive collections already belonging to the State might be forwarded, instead of attempting to make a special collection. Mr. Almarin B. Paul writes a letter, which is published on page 2 of this number of the PRESS, commenting unfavorably on this suggestion and saying: "The move is a well-devised plan, however, to save drawing from the \$300,000 appropriation the \$50,000 due the mining industry for making a collection," and also that "it is very clear that the powers that be are figuring, simply to use the mineral exhibit as a cat's paw for other special interests."

Both these statements are entirely uncalled for, since the "powers that be"—the Commissioners—have not yet considered the subject of the mineral collection in any way, as far as we are informed. The "well-devised plan," as Mr. Paul calls it, was simply the suggestion of the PRESS, and did not come from the Commissioners or any one of them. It is absurd to talk of spending \$50,000 to make a special collection of minerals when the State already has far better ones than that amount of money could now obtain.

The object of suggesting that the various State collections of minerals in the Mining Bureau and State University might be taken to Chicago, was that the mining industry of California might be properly represented and make a showing of minerals which would excel all others. State officials have been collecting these minerals, identifying and labeling them for years, and no State in the Union has anything like what we have in this line. The object of the Mining Bureau is to advertise the mining interests of California. It could do it in no better way than to exhibit its collection at Chicago. The State Mineralogist took a collection to the New Orleans Exposition, and there is no reason why that official could not take one to Chicago. There is no reason or sense whatever in spending \$40,000 or \$50,000 of the \$300,000 appropriation in getting together a new lot of minerals when we already have such splendid collections.

Mr. Paul thinks the Mining Bureau might as well close its doors as consent to the removal of the collection. To this an answer is that the museum is only one feature of the Bureau, its main work being in the field now rendered compulsory by the instructions in its appropriation.

It would do no harm whatever to close the museum for a time, but that would not be at all necessary. The whole contents of the museum would not be needed at Chicago by any means. Only a good typical collection need be taken, and there is an abundance of material to draw from.

The main thing is to have California properly represented. By taking the collections already made, we could excel all other States, since none of them are in a position to show what we can. Then the commission could provide means for exhibiting the various California inventions connected with mining and metallurgy. If, however, they are called upon to spend a lot of money to collect minerals, that is about all they will think necessary.

Little attention is paid to the mining industry by the State or its officials. The miners themselves are apathetic. There is no miners' association to further their interests. We fear that an attempt to make a collection of minerals will not succeed as well as in former years. The miners are tired of contributing. Moreover, a whole lot of men would have to be paid to attend to it, and money would be spent that it is not necessary to spend.

The whole object of the PRESS in this matter was to see the mining industry of California well represented. It does not care to enter into any controversy on the subject, as we have seen enough of the results of that in connection with the Horticultural Bureau. If anybody has any better suggestion to make, we shall be glad to second it, but one involving the expenditure of \$50,000 or so for something we already have, is not a better suggestion for the mining interests, though it might be for the interests of those who would get the money for making the collections.

Tin Plate.

On Wednesday (July 1st) of this week the increased tariff on tin plate under the "McKinley Bill" went into effect, the duty now being \$2.20 per 100 pounds instead of \$1. So far as observable the increased rate has had no visible effect, it apparently having been previously discounted by an advance in the demand markets under a large increased call for plate from the United States. The increased buying by this country does not appear to have been done so much by canners and regular dealers as it was by speculators. What the effects of the latter's holdings will have on the market is an open question, but it is an undeniable fact that all such have, heretofore, been an incubus, and hung as a weight upon the market.

Iron Age says that British makers have, since the period of heavy buying of plates for American account prompted by the passage of the McKinley Tariff bill, reaped enormous profits and worked their mills to the utmost capacity. Having supplied the exceptional demand, a curtailment of production has taken place, and surplus supplies at factories and shipping ports are now considerably below the average amount. But, notwithstanding the closing down for a month of 44 tinplate manufacturing plants, prices have fallen in the English markets. This is accepted as proof positive that when the factories start up again the output will be so largely in excess of the demand that prices must necessarily recede in England to old figures—below \$5 a box. The largest consumer, Pacific Can Factory, in this city is acting upon the belief that the English market will fall so as to uncover the increased tariff. This company has already entered into contracts abroad for tin plate to meet their 1892 requirements, the duties on which will aggregate fully \$500,000.

Latest official statistical data of the movement of tin plate are as follows: During the year 1889 a total of about 5,650,000 boxes of tin plate were shipped from Great Britain to the United States, and in the following year 5,300,000 boxes were sent to this country. It is generally admitted that the supply on hand here, Dec. 31, 1890, was comparatively small.

It is, therefore, a reasonable deduction from the data submitted, that the average consumption of tin plate in the United States during the two years quoted was more rather than less, than 5,000,000 boxes per annum. Shipments to this country from Jan. 1 to May 30, 1891, amounted to about 3,475,000 boxes. During the first half of June, about 450,000 boxes were sent, which completes shipments that can reach here before July 1. This movement is far above the average for the corresponding period of previous years, exceeding that of 1890 by 1,617,000 boxes and that of 1889 by 809,000 boxes.

Should the production of plate in this country gain the rapid strides that the manufacture of other steel and iron has in recent years, the foreign markets need not be so much depended upon in the future.

With the adoption of modern appliances and improvements, the record of the steel rail industry may be repeated, or even excelled. It is patent, however, that the foreign sources of supply will have to be relied upon for some time to come. Out of, say, 5,000,000 boxes of tin plate consumed annually in this country about 1,750,000 boxes go into the manufacture of packages for goods that are sold in foreign markets, upon which a rebate of 90 per cent of the original duty is paid by the Government to the packers of the goods. There thus remain about 3,250,000 boxes, which represent, approximately, the amount that American manufacturers can reasonably calculate upon having a chance to compete for, and it will doubtless be some time before they get into position to turn out that quantity.

THE principal sources of aluminum have heretofore been cryolite from Greenland and imported bauxite, but recently, discoveries of bauxite have been made in Arkansas, which will no doubt lead to the extensive use of the domestic article.

FORTY-THREE mineral-producing counties in Georgia, Alabama and Tennessee, in a convention of more than 100 delegates held at Chattanooga, Tenn., have decided to make a tri-state exhibit at the World's Fair.

We Shall Be Obligated.

The publishers of the PRESS would consider it a favor for subscribers to renew their subscriptions during the coming month. Many of those whose subscriptions have expired, or are about to, would probably not inconvenience themselves but would oblige us by promptness in sending in the money. A settlement of this kind from several hundred readers is of material assistance on occasion though the amount may be small from each. The price of the PRESS is sufficiently small so it should be little trouble for our subscribers to answer this appeal.

Extracting Gold and Silver.

A patent has just been obtained through the MINING AND SCIENTIFIC Patent Agency for extracting gold and silver from ores, by Louis M. Howe of Greenwood and Lewis A. Gates of San Francisco (assignors to Henry J. Postel, this city). The patent covers a method of forcing the ore through a bath of molten or liquid metal. There is an exterior chamber to the apparatus, made of brick or other suitable material and adapted to contain a melted or liquid metal which will take up and separate the precious metals from the ore. A vertical shaft extends from top to bottom through this chamber, and has stirrers at its lower end, arranged so that two sets of stirrers rotate in opposite directions to agitate the pulverized ore.

Across the chamber are three sets of perforated disks, and beneath each set is another disk having perforations to correspond with the fixed ones. These may be turned so as to close or open the holes, the two working with relation to each other like an ordinary circular damper. There are, as stated, three sets of these. Above the upper perforated plate is a large chamber, forming the upper part of the cylinder and having a discharge opening out of one side.

Passages opening into the top of the cylinder serve to admit a strong blast of heated air, the object of which will be described hereafter.

Upon one side of the chamber is formed a circular chamber standing in a vertical plane, and having its lower portion opening into the bottom of the chamber by a passage. Within this vertically arranged chamber is journaled a wheel. The periphery of this wheel is formed into an inclined chamber which extends all the way round forming a sort of double rim into which the ore is fed from above by a screw or worm. The rotation of the wheel carries the ore down beneath the surface of the molten metal and delivers it into the lower part of the main chamber where the melted metal is kept. A peculiar scraper causes the ore to be discharged from the carrying wheel into the metal. Here it is agitated by the stirrers and caused to gradually rise up through the metal and through the openings in the perforated plates or disks. When the ore finally rises through the upper set of disks above the surface of the metal, it is subjected to a strong blast of superheated air which separates any of the liquid metal from the ore and prevents its being carried off with the ore. The fine dust of the ore, which by this time has been separated from the precious metals, will be discharged through the opening by reason of the blast, and the operation of the apparatus will thus be continuous. The perforated disks prevent the ore rising too rapidly through the metal, and it may be kept the proper length of time in the bath of metal.

THE MINT AND SILVER.—There were 45 employees discharged from the U. S. Branch Mint in this city on Tuesday, mainly from the Coiner's and Adjuster's departments. The reason for the wholesale discharge was announced to be Secretary Foster's determination to cease the coinage of standard dollars, at least temporarily. The law gave him the option of coining or not, as he saw expedient, on and after July 1st. He exercised his discretionary power by declining to continue coining, with an important exception. He decided to coin only as much as would cover an amount of trade-dollar bullion on hand amounting to \$5,000,000. None of that bullion is on this coast, so the force here had to be reduced one-fifth. This action, of course, interferes in no way with the purchase of silver, which will, as usual, continue from month to month. It was stated by a gentleman connected with the Mint that the coinage of dollars will in all probability be resumed on the first of next year.

Washington.

Perhaps we cannot more pointedly bring to the minds of our readers thoughts appropriate to the reoccurrence of the nation's birthday than by presenting the impressive view of the Washington monument which appears upon this page. This grand structure is to perpetuate the memory of Washington, and the memory of Washington is more than the recollection of a great historic individual; it includes a con-

July 4, the greatest monument to Washington, the greatest monument ever raised to the memory of any man, the highest enduring structure in the world.

The foundations of the Washington monument were laid Feb. 28, 1848, and it was completed and dedicated Feb. 22, 1885. It is a hollow shaft of granite, faced on the outside with blocks of white marble, 555 feet high. A comparison with the other noted artificial elevations of the world will readily convey to the

within the monument. The States of the Union, and in many instances cities, as well as numerous foreign countries, are represented in the obelisk, and California contributed a memorial stone. In 1852, the California stone was hewn out of a quarry of the finest variegated marble at Ringold, El Dorado county, Cal., under the direction of John Bigler and Col. John F. Hall, and brought to Sacramento with an ox team. It was shipped to Washington under direct supervision of Gov. Bigler.

Tuscarora, Nevada.

(Continued from page 1)

Adjoining Tuscarora are some fertile valleys. Most of the ranchers, however, devote themselves to stock raising, as the foothills afford good pasturage. Of course, one must have enough land under fence to put up hay in case of a hard winter.

The winter of '89 was very severe, and those who were not prepared with shelter and feed for their herds, suffered heavy losses. The snow lay to the depth of four feet on the level for five months, and it was distressing to see the poor dumb animals starving and freezing.

That was an exceptionally severe winter. The spring following, the remains of several sheep herders and mail carriers were found. They had evidently perished in some of the blizzards.

The nearest railroad is at Ely, the county seat, a distance of 50 miles. About 15 miles from Tuscarora are the famous mud springs, which are frequented in summer by many invalids. The little basin in which they are located is surrounded by four almost perpendicular cliffs on the top of which the lizard and horned toad bask in the hot sun.

Adjoining these springs is Snow Canyon, noted for its beautiful waterfall which gushes with a tremendous roar from the mountain side. The land on which this water has its outlet is very valuable, and was in litigation for many years, but the contestants being members of each sex, the difficulty was compromised by a nuptial knot.

The Flood in the Desert.

On Saturday last a portion of the Colorado desert commenced to fill up with water, and the low place where the salt mines are, is now a lake which is daily extending in size. This portion of the desert is below the level of the sea. The water doubtless comes from the overflow of the Colorado river, which has filled the old "sink" of the desert so full that the water has forced its way through the sound into the lower basin at Salton where the mines are. An engineering party has been sent out by the Southern Pacific Co. to investigate the matter, as, if the rise in the water continues, the tracks may be reached. Evaporation is, however, very rapid in that region. The water is supposed to have come through a break in the Colorado river at Pilot Knob, some 15 miles below Yuma.

The Colorado river carries an enormous body of sediment from the upper country, and of this sediment it has built a great delta at its mouth in such a manner as to cut off the upper portion of the gulf by a great alluvial dam, and the river has found its way by a cut-off to the gulf southward. Then the water which was in the upper basin has evaporated so that the bottom of the ancient gulf thus cut off is now below the sea level.

Whenever the Colorado is at a great flood height, as it has been lately, some of its waters are likely to find, and usually do find, their way across the delta to the north, where they flow into this low ground, which is below the level of the sea. There has been no such flood as this in the desert region since the country has been occupied by the whites.

THE FULTON IRON WORKS have obtained the contract (for \$26,500) for building a "disinfecting boat" for the use of the U. S. Marine Hospital service at this port. The boat will be 80 feet long over all, 16 feet 9 inches beam, and 5 feet 9 inches draft. The system of disinfecting vessels will be the same as pursued by the "Holt" Board of Health, consisting of the purification of ship and effects by the use of bichloride of mercury solution, heat and sulphur dioxide gas. A ship can be disinfected in a few hours. When completed, the boat will be stationed at the quarantine hospital wharf at Angel island, where steam will at all times be kept up. When not in use fumigating, she will be utilized in carrying passengers to and from the quarantine station and the city, and for the pleasure of patients at the hospital.

THE Kimberley diamond mines, South Africa, are curtailing production, and the price of these gems is expected to advance materially.

THE product of aluminum for the census year 1889, was 47,468 pounds, including aluminum alloys valued at \$97,335.

THE WASHINGTON MONUMENT AT THE NATIONAL CAPITAL.

ception of the thoughts and acts which made him great, and of the principles which underlie our existence as a nation, and truth to which will insure our future. Washington has become to us more than a man; even more than a statesman, a warrior, a patriot. Washington stands the ideal American, endowed with every truth, nobility and virtue which the human mind can conceive embodied in human life, consequently to speak his name in the fullness of its significance is to bring to mind all we are as a nation and all we hope to be.

Therefore, we chose as our leading illustration in this issue, which bears the honored date

reader the wonderful dimensions of the monument. The nine highest in the world are as follows: First, the Washington monument, 555 feet; second, the Cologne Cathedral, 510 feet; third, the great Pyramid of Cheops, 480 feet; fourth, St. Peter's Church at Rome, 448 feet; fifth, St. Paul's Church, London, 360 feet; sixth, St. Mark's Church at Venice; seventh, the Capitol at Washington, 283 feet; eighth, the Brooklyn Bridge Tower, 276 feet; ninth, Trinity Church, New York, 263 feet.

The apex is a pyramid of white marble, topped with metal and a lightning rod. The dizzy height may be reached by an elevator

In the west wall of the monument, just above the platform, at the height of about 150 feet from the base of the shaft, and easily seen, is a stone bearing the following inscription in sunken letters:

California,
The youngest sister of the Union,
Presents this Golden Tribute to the
Memory of its father.

There was another stone, prepared in 1860 by the miners of Columbia, Tuolumne county, which was shipped by sailing vessel. The ship made a quick trip, but was sunk just before reaching New York. The miners' stone never reached the monument, but lies on the bottom of the Atlantic.

ROSE'S Mechanical Drawing SELF-TAUGHT.

Fourth Edition, Thoroughly Revised and Corrected.

RECENTLY PUBLISHED.

Mechanical Drawing Self-Taught; Comprising Instructions in the Selection and Preparation of Drawing Instruments, Elementary Instruction in Practical Mechanical Drawing, together with explanations of Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motions, Engines and Boilers. By Joshua Rose, M. E. Illustrated by 330 engravings. Fourth edition thoroughly revised and corrected. 8vo. Price.....\$4.00

BY THE SAME AUTHOR:

Modern Steam Engines. An Elementary treatise upon the Steam Engine, written in plain language for use in the workshop as well as in the drawing office, giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation; together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to plot out their movements upon the drawing board. By Joshua Rose, M. E. Illustrated by 422 engravings. In one volume, quarto, 321 pages. Price.....\$6.00

The Complete Practical Machinist. Embracing Lathe Work, Vise Work, Drill and Drilling, Taps and Dies, Hardening and Tempering, the Making and Use of Tools, Tool Grinding, Marking out Work, etc. By Joshua Rose, M. E. Illustrated by 355 engravings. Fifteenth edition thoroughly revised and in great part rewritten. 12mo, 439 pages. Price.....\$2.50

The Slide Valve Practically Explained. Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. By Joshua Rose, M. E. Illustrated by 35 engravings. 12mo. Price.....\$1.00

Steam Boilers. A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users and Inspectors; and embracing in plain figures all the calculations necessary in Designing and Classifying Steam Boilers. By Joshua Rose, M. E. Illustrated by 73 engravings. 8vo. 350 pages. Price.....\$2.50

Illustrated Circulars, giving the full tables of contents of all the above works, sent free to any one who will apply.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

Our new revised Descriptive Catalogue of Practical and Scientific Books, 81 pages, 320, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

GOLD MINES

—AND—

STOCK IN MINES FOR SALE.

Dividend-paying Mines from \$150,000 up.
Undeveloped Mines from \$10,000 up.
Undeveloped Mines on Bond.
Stock in Dividend-paying Mines from \$1 up.
Stock in Undeveloped Mines now being
opened from 25 cents up.

All situated in the GRASS VALLEY MINING DIS-
TRICT, the Oldest Quartz Mining District on the Pacific
Coast, and the Richest and most Permanent in the
World. The mines of this district are practically inex-
haustible, as nearly half a century of constant working
is proof. Grass Valley has the deepest regular dividend-
paying gold mines in the world, and the cost is not yet,
for these same mines are as rich to-day as at any time
during their history.

Gold mining, especially in Grass Valley, when under
honest and scientific management, is one of the safest
and most profitable of all American industries. It is a
business that will return annually a profit of from 100 to
300 per cent on the investment. Mining is a science
acquired only by years of study, combined with practical
experience. Therefore, failure is the rule whenever the
management is ignorant and unscientific.

The undersigned is a practical scientific and successful
miner, has made mining a life study and vocation, is
honest and trustworthy, and will not, under any circum-
stances, recommend or deal in any but valuable paying
property and properties that will develop dividend-
paying.

No Wildcat Mines; no Sharp Practice; no reasonable
chance for loss; Honesty and Square Dealing Guaranteed.
Correspondence solicited.

Full particulars by applying to

S. B. FOWLER, Supt. Hartery Mine,
Grass Valley, Nevada Co., California.

THE RUSSELL PROCESS.

duction of Ores containing precious metals, and terms
of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

**JAMES LEFFEL'S
Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

KROGH'S MINING HORSE-POWER HOIST

Is known to be the
Best Horse-Power
Hoist now made.
It is strong and
durable.
The drum will
carry 1000 feet of
five-eighths steel
rope. It can be
used to run a
pump or blower,
in conjunction
with hoisting.
Manufactured by

**F. W. Krogh
& Co.,**

51 BEALE ST.,
San Francisco.

**QUARTZ SCREENS**

A specialty. Round, slot
or buried slot holes. Gen-
uine Russia Iron, Homo-
geneous Steel, Cast Steel or
American planished Iron

Zinc, Copper or Brass Screens for all purposes. Call-
ifornia Perforating Screen Co., 145 & 147 Beale St., S. F.

The instrument represented in the above cut is a
new and grand little invention, being designed to
save life and limb, and innumerable lawsuits, by
doing away with the dangerous operation of digging
out wet and unexploded loads where Giant Powder
is used in mining. The little instrument crimps the
cap on to the end of the fuse firmly and abso-
lutely water-tight. It is also used for cutting the
fuse. They are neatly gotten-up of the finest
cast steel, nickel plated, Price, \$2 each, or the
entire instrument finished in gold plate, \$5.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Hauling Sagebrush.

The sagebrush, which is so abundant in certain portions of this coast, is used for fuel where larger wood is scarce, and it would be difficult to get along without it in many mining camps, especially in Nevada. The cut on this page shows one of the teams hauling this brush to the quartz mills. A correspondent furnishes us the following information.

"The handling of sagebrush has proved a remunerative business in Tuscarora, Nevada. As it is impossible to get wood enough to supply the mines, the brush is substituted."

"In early days it was cut within half a mile of town and sold at \$2.50 per cord; since it became necessary to haul it 10 and 15 miles it has advanced in price. Generally a man takes a contract to furnish a certain quantity, and as soon as the weather permits, he takes a crew of Mongolians equipped for the season. After the brush is cut and trimmed, it is loaded on the wagons something in the fashion of hay. Three wagons comprise a load for seven span of horses. After being hauled to the mills or mines, it is measured. After this, all the ropes are untied and some of the horses are transferred to the side of the wagon; then the driver tells his men to 'stand clear.' He then cracks his whip and the wagon is turned on its side and the brush is dumped."

An Electric Locomotive.

Among the numerous electrical appliances for mining purposes, manufactured by the Edison General Electric Co. of New York, is the mining locomotive, shown in the cut on this page. As will be seen, it is a very compact piece of mechanism, strongly built and intended especially for tunnel and other underground work. Now that electric power is being so rapidly utilized in mining operations, this machine will doubtless more rapidly come into use, doing away with horse and man power in pushing the cars underground. Of course, there is great advantage in this, as it admits of rapid handling of material and furnishes all the power necessary. In the long tunnels in the gravel mines of this State these electric locomotives ought to be adopted, especially where there is water power within a few miles to furnish power for generating the electric current.

The South Homestake mine, White Oaks, N. M., caught fire, last week, and two miners, E. Timoney and George Drake were suffocated.

HAULING SAGEBRUSH, TUSCARORA, NEV.

The Tulloch Concentrator.

The sulphuret concentrator invented by James Tulloch of Sonora, Tuolumne Co., has recently been improved and is now being manufactured in this city by the Risdon Iron Works. As the engraving shows, the machine consists of a rocking frame, which supports a drum on each end, intermediate rollers, a belt, and gear wheels on the ends of the highest drum, together with ratchet wheels and pawls, the pawls being hinged to the outside stationary frame. The concentrator is operated by two eccentric rods, issuing from the outside stationary frame and connecting with the rocking frame at both of its ends. A movement of one or two inches of these rods causes the rocking frame and all attendant parts to oscillate from side to side, gently, but positively, and wash the sand to the lower end of the belt, while the sulphurets, by their specific gravities, gravitate and adhere to it, until reaching a water trough underneath the large drum, they are deposited. In conjunction with the lateral motion of the belt, a quick, sudden motion is communicated to it by the ratchet wheels on each end of the large drum, engaging the pawls by contact with

them as the frame rocks from side to side. The frame is provided with cast iron grooved rockers, which rest on plates secured to the frame.

California Mining Machinery.

Our State Commissioners should make an effort to collect for the Chicago World's Fair types of all the mining machinery for which California is famous. Most of the appliances for both the gold and silver mills in common use in this country originated in this State, because it was here that for many years all the Pacific States and Territories came for their machinery. In amalgamators, pans, settlers, ore-feeders, concentrators, furnaces, rock-breakers, ore-pulverizers, etc., there have been countless inventions made here. It would be a good thing for those who have the mining division in charge to see that all these types are brought together at Chicago.

Many of the inventors have models of their machines, and in other cases full-sized machines could be taken. The inventors themselves would no doubt gladly aid in this matter, and the result would be an exceedingly instructive display. The State Mining Bureau has never made any attempt to get the mining inventions of California, and has few models or machines. But the World's Fair Commission could do this with little trouble, and this collection, added to that of the minerals, would redound to the credit of the State.

Nearly all the appliances of hydraulic mining, such as the monitors, undercurrents, derricks, gravel elevators, etc., originated here, as did the system. There are many inventions of importance in this connection which could be made into a separate display. Then those related to quartz mining and milling could also be grouped. The miners of this country could be brought to a realizing sense of what they owe to the California miner and inventor for appliances they have in every-day use. It is greatly to be hoped that the Commission will at once begin to take steps in the direction of the mining display and prepare for exhibiting not only the minerals of the State, but the mechanical appliances which originated or were brought to perfection in California.

THE Mineral Palace at Pueblo, Colo., was opened on the 5th inst. An immense and valuable collection of minerals is displayed, and there are mine models, machinery, etc. San Juan and Pitkin counties have the most complete exhibits of the mining counties of the State. The building cost about \$150,000, and is especially devoted to the mining industry.

LEAD ORES.—The census gives the following as a result of the investigation into the product of lead ores: Colorado, 70,788 short tons; Idaho, 23,172 short tons; Utah, 16,675 short tons; Montana, 10,138 short tons; Arizona, 31,158; Missouri, 44,482.

ELECTRIC MINING LOCOMOTIVE.

TULLOCH'S IMPROVED CONCENTRATOR.

Overloaded Mining Companies.

A growing disposition is being shown by those who are interested in our undeveloped mining properties, to offer English speculators an opportunity of sharing the good things that we enjoy in this highly favored land. We know that this tendency is not due to any special overflow of the springs of human kindness or to any outburst of generosity on the part of the local people. Moreover, we fear, that the ruling motive in these cases is not so much a laudable desire to develop the Australian mining industry and at the same time afford the English shareholder a profitable investment, as a wish to bring the golden shekels in goodly numbers into the gaping pockets of the vendors. The flotation of properties on the London market affords an easy means of raising capital and at the same time securing a far higher price to the owners of the property than could be obtained on the spot, and no one could raise the slightest complaint so long as the enterprises to be embarked in are genuine and the price which the English shareholders are called upon to pay for their interest is not excessively high. It has, we are sorry to say, happened in the cases of a number of companies floated, not only in London, but also in the colonies, that the properties have been shamefully overvalued by the enormous sums asked for by the vendors, and the exaggerated estimate put forward as to the value of the mine has in numberless instances brought ruin to the shareholders and profit to none but those who were shrewd or fortunate enough to secure a share of the solid cash forming part of the purchase money. It is not necessary in this article to point to instances of this sort, as no doubt any one of our readers could call to mind scores of cases which will fairly answer to the description we have given. What we are anxious to do at the present stage is to sound a note of warning against pursuing this sort of policy too far, and to express our conviction that, unless great care is exercised in appraising London speculators, those who are seeking assistance will find that they have overshot the mark and that the ears that once listened eagerly to the glowing stories of Australian mineral riches are now cold and unsympathetic. We feel certain that, except perhaps in a few specially favored cases, English speculators will fight shy of ventures in which enormous prices have to be paid for mines, which, although possibly of high prospective value, offer no immediate tangible security.

We must remember that we are not the only people in the outlying parts of the world who have mines, surrounded by all the attractive glamor that attaches to the comparatively unknown, to offer to the home speculator. British men of money have lately been led a pretty dance by some of the more enterprising and unscrupulous spirits connected with the South African gold-fields, and the bitter experience gained in these and other unprofitable speculations has not gone for nothing. Further than this, it must be borne in mind that our own record in the English mining market is not too good, and that with fresh fields of enterprise opening up on several hands, notably in Canada, and possibly also in the much talked of Mashonaland, the British public are not likely to bite too greedily at the alluring baits held out in the guise of Australian mines. We are strengthened in this view by the advice sent out recently by our London correspondent to the effect that while there has been no falling off in the enterprise displayed in the London mining market a much more cautious spirit prevails, and closer enquiries are being made by investors than formerly; that although the days of wild and indiscriminate speculation are perhaps not quite gone, they are rapidly drawing to a close.

Any legitimate enterprise in which the London public are asked to participate on fair terms is not likely to be prejudiced by this change of attitude, but on the contrary, the more perfect the check placed upon wild cat flotations and unduly inflated estimates of property values, the better will be the prospects of success with genuine proposals. The history of Australian mining furnishes scores of cases during the last few years in which properties have been floated into companies, and overloaded to such an extent by the exorbitant requirements of those who, to use a common phrase, have "got in on the ground floor" that all the glowing prospects presented to a too confiding public would have to be more than realized before dividends could come within the range of possibility. Many companies have been floated with enormous capitals, of which only a fractional part has been left available for legitimate expenditure after the vendors of the mine have been paid, and the brokers and middlemen employed in the launching operations have had their pickings. Nothing short of phenomenal good fortune could place such mines, overloaded as they have been, on a sound dividend-paying footing, and the investing public, both here and at home, are becoming more and more jealous of the diversion of large proportions of their cash contribution from the work of legitimate development into the pockets of a few favored individuals. The high estimates placed upon some of these properties by greedy vendors may be based upon their honest opinion of value, but they nevertheless still further minimize the already too slender chances of making the investment profitable to the shareholders. The English speculator knows this well enough,

and as he does not pay his money for the fun of the thing, but in the hope of getting good solid dividends, he is likely to look askance at any proposal which fails to offer reasonable security that the bulk of his money will be devoted to real honest mining work.—*Australian Mining Standard*.

Amador County Marble.

The Amador Ledger says: Last Monday, in company with S. G. Spagnoli, L. J. Fontenrose and S. N. Spagnoli, we visited the quarry of the Carrara Marble Company. It is located on Sutter creek, almost due north of Pine Grove, and by the wagon road is 12 miles from Jackson. The new road constructed by the company leaves the main county road about a mile west of Pine Grove, and winding around considerably reaches the quarry in four miles. The grade in no place is steeper than on the public roads. It is soft in places, and also narrow, but with all defects it is a good serviceable thoroughfare. The quarry is located in a wild region, the steep hillsides being thickly covered with young timber and underbrush. The point where they have commenced operations is nearly midway up the hill—fully 200 feet above the creek bed. This was selected because it was easier to open at this point, and also because it involved an easier grade for the roadway on the south side of the creek than if work were started nearer the bottom. It also secures ample dumping room for waste material, thousands of tons already covering the hillsides below the quarry. There were ten men at work, most of them being employed in squaring the blocks—an operation which requires considerable time. Over 100 tons have already been shipped or prepared for shipment, but the face of the deposit is hardly touched. It is a mountain of marble; the width has been measured for 120 feet, and will probably prove greater when the earth is stripped from the face.

The supply is practically inexhaustible. Where the stone crops out from the hillside it is considerably broken with fissures and cracks, but it is expected that as it is opened up it will become solid and compact, and also that the grain will become finer. In the rough it is impossible for a novice to form a correct idea of the marble as it appears when polished. Messrs. Bald and Riot, who have had long experience in marble of all kinds, domestic and foreign, say the stone from this quarry is better than any other on the coast. It is not so hard and flinty as the Inyo marble, and consequently is not so expensive to work. There were 9 or 10 blocks awaiting shipment, of various sizes. The largest was eight feet long, four feet wide and three feet thick, and weighed in the neighborhood of eight tons. It contained 120 cubic feet and was worth in the rough, delivered in San Francisco, \$300. There are four or five teams engaged in hauling to Lone. One of the largest blocks yet shipped was hauled Monday by Prouty's team. It weighed 90 hundred-weight.

The outlook is favorable for a thriving business in marble from this quarry. It is being used for pavement at the Stanford University, and this will be not only a first-class advertisement, but also a good test of its durable qualities.

Recent Additions to the State Mining Bureau.

Quicksilver ore, near Berryman Station; A. V. Tuohy.
Gold in Bismutite, Dos Cabezas, Cochise Co., Arizona; Mr. Patterson.
Tin ore, Deer Lodge, Montana; F. W. Trap-hagen.
Calcite (carb. cal.), Bierigg mine, Egremont, Cumberland, England; Williamsburg Sci. Society.
Opal (common), Guaoajuato, Mexico, Williamsburg Sci. Society.
Mallockite (oxychloride of lead), Cromford, Derbyshire, England.
Schwartzengbergite (oxychloride and iodide of lead), Chile.
Polycrase (rich in scandium), Marietta, Greenville Co., South Carolina.
Garnet, Pink (with vesuvianite), Morelos, Mexico.
Coloradoite (telluride of mercury), Smuggler mine, Boulder Co., Col.
Leucite (silicate of aluminum and potassium), Magnet Cove, Arkansas.
Willemite (silicate of zinc), Franklin Furnace, Sussex Co., N. J.
Monticellite (silicate of calcium and magnesium), Magnet Cove, Arkansas.
Herrengründite (hydrous sulphate of copper), Herrengründite, Hungary.
Diabase, Weldo, Kern Co., Cal.; C. J. E. Taylor.
Gypsum (hyd. sulph. calc), var. alabaster, occurs in large quantities in the Cuyama Val., San Luis Obispo Co., Cal.; Myron Angel.
Asphaltum, occurs in quantity in the Cuyama Val., San Luis Obispo Co., Cal.; Myron Angel.
Sandstone (impregnated with petroleum), Petrolia, Humboldt Co., Cal.; A. McGregor.
Auriferous vein matter (rich in gold), Hematite, Rose mine, San Bernardino Co., Cal.; G. W. Woodworth.
Laumontite, Cucamonga canyon, San Bernardino Co., Cal.; H. Sontag.
Fossils (from oil rocks), Ventura Co., Cal.
Gold quartz, Venus mine, Campo Seco, Calaveras Co., Cal.; A. B. Summers.
Calcite (carb. cal.), Melbourne, Victoria; Fred. Danvers Power. Also 35 mineral specimens of various kinds, including auriferous gossao and other gold bearing ores, asbestos, stibnite, kerosene shale, amazon stone, cassiterite (in gressee), stream tin, etc., from the different Australian Provinces.

The Stanford University.

The Leland Stanford Junior University has announced the arrangement of the courses of instruction and the list of professors and studies.

The appointments of members of the faculty so far made are David Starr Jordan, formerly of Indiana University, President; Andrew Dickson White, ex-Minister to Germany, non-resident Professor of European History (resident in March, April, May); George Elliott Howard, formerly with the University of Nebraska, Professor of American History and the History of Institutions; John Casper Branner, formerly of the University of Indiana, Professor of Geology (work to begin in 1892); Oliver Peebles Jenkins, formerly of the Panu University, Professor of Physiology and Histology; John Henry Comstock, formerly of Cornell University, non-resident Professor of Entomology (resident in January, February and March); Melville Best Anderson, formerly of the State University of Iowa, Professor of English literature; John Mason Stillman, formerly of the University of California, Professor of Industrial and Inorganic Chemistry (work to begin in 1892); Ferdinand Sanford, formerly of Lake Forest University, Professor of Physics; Henry Alfred Todd, formerly of Johns Hopkins University, Professor of the Romance Languages (work to begin in February, 1892); Charles David Marx, formerly of the University of Wisconsin, Professor of Civil Engineering; Joseph Swain, formerly of Indiana University, Professor of Mathematics; Ernest Mondell Pease, formerly of Bowdoin College, Professor of the Latin Language and Literature; Horace Bigelow Gale, formerly of Washington University, St. Louis, Professor of Mechanical Engineering; Charles Henry Gilhert, formerly of Indiana University, Professor of Vertebrate Zoology; Douglas Houghton Campbell, formerly of Indiana University, Professor of Cryptogamic Botany; Earl Barnes, formerly of Indiana University, Professor of the History and Art of Education; Edwin Hamlin Woodruff of Florence, Italy, Librarian; James Owen Griffin, formerly of Cornell University, Assistant Professor of German; George Mann Richardson, formerly of Lehigh University, Assistant Professor of Inorganic Chemistry; Arthur Gordon Leird, formerly of Cornell University, Instructor in Greek; Orrin Leslie Elliott, formerly of Cornell University, President's Secretary and Registrar and Acting Instructor in Economics; Louis Alexander Buchanan, formerly of the St. Louis Polytechnic Evening School, Foreman of the Wood-working Shop; Daniel Kirkwood, formerly of Indiana University, Non-Resident Lecturer on Astronomy (resident in May); Jacob Gould Schurman, formerly of Cornell University, Non-Resident Lecturer on Ethics (resident in March).

Mechanical and Mining Engineering.

The course of instruction perhaps most completely arranged is that in mechanical engineering. Four years' work is outlined, and by the time the student finishes it he ought to be able to thoroughly understand the construction of everything from a steam pump to an underground electric cable and conduit.

In the first year, those ambitious to be mechanical engineers will get a splendid chance at advanced mathematics and English composition, and work in the physical laboratory and the shop. In the second year, they will get more of mathematics, more of physics, and will study machines where machines are made. The third year's feature will be studies in analytic and applied mechanics, chemistry and drawing, with options and elective studies in mechanical engineering. The last year will be given up to elective studies in mechanical engineering. The aim in this course will be to turn out thoroughly practical men.

The course in civil engineering has been arranged with the same end in view. The students will have a chance at railroad engineering, land surveying, bridge work and surveying for sewerage and pavements, and will be obliged to take the collateral work that belongs to such a course.

The work in mining engineering will not be begun before the second year. First-year students in the department will be taken through that year's work in civil engineering with the courses in elemental geology.

Studies in Geology.

The work in geology will not be begun until the second term, and will consist first, in elemental geology, in lectures on dynamic and structural geology; second, in topographic geology, in field and office work in topography, and third, in paleontology in lectures and laboratory practice in identifying fossils.

The work in zoology will comprise laboratory studies of the typical forms of animals and systematic zoology. The comparative anatomy of the vertebrates will be studied in the laboratory, and there will be an advanced course in systematic ichthyology, and a course of lectures on the laws of organic life.

Physiology and histology will be taught in a similar way. There will be elementary and special courses, students preparing for medicine being advised to take physiology as a major subject in chemistry, botany and zoology.

Instruction in entomology will be given during January, February and March, and will be in the form of lectures, together with laboratory and field work. There will be four courses in

botany, each arranged for five hours' work a week.

The work in chemistry is planned to be done almost altogether in the laboratory. For instance, in elementary chemistry, lectures are three hours a week and laboratory work daily. In this, as in most of the other studies, work will be arranged to meet the needs of individual students.

In the other studies, Greek, Latin, German, the Romance languages, English literature, philosophy, history, economics, mathematics and physics, the courses of study are arranged much as in other modern universities, and it is explained that the announcement for 1891-92 is largely tentative and subject to such modification as the needs of the students may require.

There is a course on the history and art of education, and teachers not candidates for a degree will be given every facility for carrying on special studies in the department.

Mining Stocks on Margins.

The Supreme Court of this State has again furnished local mining speculators with a fruitful theme for discussion. It has denied the petition for a rehearing in the case of Cushman vs. Root.

This petition was presented by the prominent law firm of Garber, Boalt & Bishop as amici curiae on behalf of the San Francisco Stock Exchange, who are interested to a great extent in the final decision of the case.

The facts of the case and the points on which the rehearing was asked were presented by Mr. Garber.

Counsel argued that under the decision as it now stands no one can safely make an investment in the shares of any corporation or association, no matter how profitable it may be, unless he has all the money on hand required to make the purchase. The savings accumulated by labor cannot be utilized for a first payment, relying upon future savings to make up the full amount necessary, nor can the investor induce another who happens to have money on hand to advance him the money, less such payment as he is able to make at the time, retaining the stock as a pledge and security for the money so advanced.

It is claimed that Section 26 of Article IV of the Constitution, under which the suit was brought, only applies to time contracts. The important clause is: "All contracts for the sale of shares of the capital stock of any corporation or association on margin or to be delivered at a future day shall be void."

In this case it was contended that there was no sale of shares on margin to correspond with the alleged purchase of shares on margin. The Constitution does not forbid the purchase of shares on margin, but forbids a sale of shares on margin. This, it was argued, is not a mere verbal distinction, but a very substantial and material difference.

People of small means are enabled to make judicious investments of their money by installments, and if such purchases were absolutely forbidden it would necessarily result in greatly embarrassing dealings universally acknowledged to be legitimate, and in many cases to retard or prevent prudent investments by those who, since they acquire their money by industry and economy, are rarely in the possession of the entire sum in cash required for such investments.

One of the intentions of the originators of the law was to prevent a person selling something which he did not have, and as to these contracts, the Constitution has performed its mission and they have substantially ceased to exist.

The precedent followed by the court was said to have been founded on some rulings of the courts in Pennsylvania and Connecticut, but the contracts under which the suits were brought there are acknowledged to have been drawn up for the purposes of gambling.

The decision of the court was rather a surprise to investors, as the ruling will apply to the most substantial investments in local as well as mining stocks, and the purchaser of 100 shares of Bank of California stock, if he has not paid for it in full, is as much in jeopardy as a buyer of West Con. Virginia seller a year.

PROGRESS OF THE SOUTH.—The *Tradesman's* report of new industries established in the Southern States during the second quarter of 1891 shows a total of 892 against 1350 for the same period the year previous. The paper says that while the number of new industries established for the second quarter of this year is not up to that of the corresponding period in 1890, still the industrial interests of this section are in a very healthy condition, and a noticeable feature for the past three months has been the amount of capital invested in enterprises. When the recent stringency in the money market is taken into consideration, the industrial activity in the South is very gratifying and justifies the assertion that no section of the country is in a more healthy condition than the Southern States.

ANOTHER CASE SETTLED.—The suit of Chas. W. Hendel against B. T. Baker was dismissed on the 21 in Judge Greene's court by agreement of both parties. The suit has been pending some time. The defendant was President of the Pioneer Mining Company, operating in Sierra county. A dispute arose over a sale of stock of the company, and Hendel demanded \$15,890 as his share.

The MacArthur-Forrest Process.

Cyanide for Gold and Silver Extraction.

[The following article, furnished to the MINING AND SCIENTIFIC PRESS by C. W. Merrill, gives the results of experiments carried on at the metallurgical laboratory of the University of California. The object of the experiments was to give the process an impartial investigation as to theory, and to look into its practicality as far as possible on a laboratory scale.—EDS. PRESS.]

The following is a brief outline of this process taken from the statement of J. S. MacArthur before the Society of Chemical Industry, as published in the journal of that body for March 31, 1890.

"The ore is ground to about the fineness of sea sand, * * * this is then mixed with a solution of cyanide. * * * The ore and solution are then stirred for about six hours. * * *

In practice the time required is determined by direct experiment. When the gold is known to have been dissolved, the pulp is discharged into an ordinary filtering tank, where the filtration may, if necessary, be assisted by suction, and where the ore is washed by water or by the waste cyanide from a previous operation. * * * On allowing the cyanide of gold solution to trickle through a mass of zinc (prepared in a form like sawdust, porous and with a large surface of bright metal,) we found that it trickled out gold-free, and better still, we found that the action became more vigorous and pronounced after a portion of the gold had been precipitated on it. * * *

When the gold has been deposited, it is necessary to separate it from the excess of zinc present. * * * The filiform mass of zinc with gold powder adhering is vigorously shaken in water, when the gold falls off and the fibrous particles of the zinc may be collected in a sieve. The gold settles easily, is collected, and fused directly into bullion."

The above was the method in its infantile outline, and below will be found a minute, detailed description of the process as it is said to be carried on at the mills of the company, or licensed by the company, at the present time. I quote from the circular of the company possessing the United States patent rights and from the description of a plant in Idaho, as described in the MINING PRESS of May 22, 1891.

The ore (usually sulphurets) is crushed dry to pass a 40 to 60 mesh screen. It is then mixed with the cyanide solution in proportions which vary from two parts by weight of ore, equal to one part by weight of solution to equal parts. The solution may be from one-eighth of one per cent to one per cent of pure KCN, according to previous experimental determination on a small scale with the given ore. The mixture is then agitated, either in revolving barrels or in ordinary pans with stirrers, for a period varying from four to eight hours, after which it is drawn into a tank provided with a false bottom for filtering. After filtration, the ore is washed either with water or with waste solution from a previous operation. The filtrate and washings are then run slowly through a filter of zinc turnings. The barren solution may then be tested volumetrically with silver nitrate for the amount of active cyanogen, and regenerated by the addition of KCN to the required strength. The gold is shaken from the zinc turnings and recovered as above described. Whenever necessary zinc turnings are added to the filter.

Now, being desirous first to see if there was anything in the process, I performed a series of experiments, using one assay ton (about 30 grms) of concentrates, sampled to 80 mesh and not acid in reaction, and 200 cubic centimeters (200 grms.) of one-half per cent solution, the proportion being, as seen, one part ore to nearly seven parts solution. These mixtures were placed in bottles and agitated in a Taylor shaker for about six hours, and then filtered through paper filters and carefully washed with a volume of water equaling the volume of solution used. The filter papers and contents were then removed and dried, the papers burned and ash mixed with the tails, which were then assayed by the ordinary crucible method. I treated thusly six ores, and the results will be clearly seen by the following table:

ORE.	Ore Assay in Ounces.	Tails Assay in Ounces.	Percent gold Extracted.
I. (a) Oregon Pyrites	13.825	15.35	13.85
(b) Oregon Pyrites	10.8	12.65	14
(c) Oregon Pyrites (1% solution)	13.85	9.97	20.4
II. Zinc Blende Concentrates	1.545	3.44	.93
III. (a) Calaveras Pyrites	5.925	32	.82
(b) Calaveras Pyrites (treated twice)	.36	10.39	33.83
(c) Calaveras Pyrites (treated twice)	.3	10.4	85.63
IV. Shasta Pyrites	15.26	11.8	2.97
V. Alaska Pyrites (treated twice)	2.355	.775	.51
VI. Alaska Pyrites (treated twice)	2.11	.58	.38

By examining the results it will be seen that the percentage of gold and silver dissolved by the solution vary from 14 to 95, and 17.5 to 85, respectively. Being satisfied by experiment a on ore III that a large amount of the solution dissolved out 86 per cent of the gold and 45

per cent of the silver, I immediately went to work to test the second step in the process; i. e., the precipitation of the gold and silver by zinc. This I did in connection with experiments b and c on the same ore (III). I treated them as I have described in the first part of the paper, except that I filtered them through sand filters and saved the tails and filtrates, introducing into the latter narrow strips of sheet zinc, which had been rolled out very thin and exposed a bright surface. The instant the zinc was put in, action commenced, the liquid became cloudy, bubbles of some gas escaped, and the zinc gradually became coated with a brown powder. In order to give this step in the process a fair trial, I allowed the zinc and solution to be in contact until no action resulted, when bright zinc was introduced. This took about 24 hours. Then, having removed the zinc, I filtered the solution, which collected any suspended particles in the filter paper. I then dissolved the zinc in dilute sulphuric acid and filtered the solution thus obtained, which contained suspended particles of gold and silver, through the same filter that I had used previously, so that I had all the gold and silver content. I thus treated the two solutions b and c of III. I now burned the filter papers carefully at a low red heat in roasting dishes and then removed the ash and contents in two scorifiers and scorified with 15 or 20 grms of test lead, cupelled and parted. I thus recovered from b, 5.22 milligrams gold, which equals 88.1 per cent of the gold content and 16.26 milligram silver, or 50.81 per cent of the silver content. From c was recovered 5.17 mg. gold, equaling 87.26 per cent, and 15.75 mg. silver, equaling 49.23 per cent. Having saved the tails, with the sand from the filter, I subjected each to a second treatment, saved the solution, and treated it as in the case of the first, and obtained from b .34 mg. of gold, equaling 5.73 per cent, and 5.65 mg. of silver, equaling 17.66 per cent; from c .45 mg. of gold, equaling 5.78 per cent, and 6.01 mg. of silver, equaling 18.78 per cent. Next assayed tails, and the results will be found in the tabulated statement below.

First sol.	Second sol.	Tails.	Totals.	Assay Value.	Per cent of Assay Value extracted.
Au. .5.22 Ag. .16.26 Per ct. 88.1	Au. .34 Ag. 5.65 Per ct. 50.81	Au. .36 Ag. 10.39 Per ct. 6.08	Au. 5.92 Ag. 32.20 Per ct. 98.91	Au. 5.925 Ag. 32 Per ct. 100	Au. 93.83 Ag. 68.47

First sol.	Second sol.	Tails.	Totals.	Assay Value.	Per cent of Assay Value extracted.
Au. .5.77 Ag. .15.75 Per ct. 87.26	Au. .45 Ag. 6.01 Per ct. 78.78	Au. .3 Ag. 6.27 Per ct. 5.06	Au. 5.92 Ag. 28.03 Per ct. 99.91	Au. 5.925 Ag. 32 Per ct. 100	Au. 94.85 Ag. 63.06

These experiments, as is easily seen, show conclusively that the zinc will precipitate all the gold and silver, if given time enough. As I see no reason why, on a practical scale, the pregnant solution cannot be made to run as slowly as desirable, the problem of the precipitation of the gold and silver, when once in solution, would seem to have been perfectly and neatly solved. This statement, however, must be modified in case the waste solution is to be regenerated. In this case, the minimum time in which the gold and silver will be precipitated must be ascertained. The zinc replaces the gold going into solution as a double cyanide of zinc and potassium. Now the amount of zinc that goes into solution varies directly with the time. The amount of cyanogen in this combination, $Zn(CN)_2 \cdot 2 KCN$, is totally inert, as regards further solvent power, as gold or silver will not replace zinc in such a combination, and only a double cyanide of a metal with an alkali is soluble. Thus it is seen that the longer the zinc and solution are in contact the less of active cyanogen (for dissolving gold and silver) will remain.

Being assured of the principle of the process and the practicality of the precipitation, I set to work to test the practicality of getting the gold and silver into solution, taking the proportions given as used in the Idaho plant, above spoken of, i. e., 2½ parts ore to 1½ parts of solution, the solution to vary in strength from one-eighth of one per cent to one per cent, as determined experimentally. For this purpose I selected three ores, i. e., the Oregon ore (which yielded in above experiments 20 per cent), the zinc blende concentrates (40 per cent), and the Calaveras sulphurets (92 per cent). I took four charges of each ore, consisting of:

Ore 1 A. T. = 30 grms. (approx.)

Solution = $30 \times \frac{1}{2} = 15$ grms. = 18 cu. cm.

Charge No. 1 was of 1%
" " " " 1%
" " " " 1%
" " " " 1%

The cyanide used showed by quantitative analysis about 50 per cent KCN, so for a 1 per cent solution would use 2 per cent by weight of the cyanide to 100 per cent by weight of water. The ore was tested as before and found neutral. Calcium Chloride was added to the solution to neutralize any hydrate that might be present (as per directions), and the mixture of ore and solution was then agitated for eight

hours. The experiments with the zinc ore gave anomalous results, which I afterward ascertained to be due to the fact that the ore contained 50 per cent silica; 37 per cent zinc blende; and 7 per cent galena, and had, owing to the great difference of specific gravity of the above components, become streaked to the bottle; in other words, was not homogeneous.

The results on the Oregon pyrites and Calaveras pyrites will be seen in the following table:

OREGON ORE.				CALAVERAS ORE.			
Per Cent Extracted.				Per Cent Extracted.			
1% sol.	17.1	10.5	10.7	1% sol.	17.1	10.5	10.7
1% sol.	17.1	10.5	10.7	1% sol.	17.1	10.5	10.7
1% sol.	17.1	10.5	10.7	1% sol.	17.1	10.5	10.7
1% sol.	17.1	10.5	10.7	1% sol.	17.1	10.5	10.7

The above results show, first, that the process is certainly a failure on the Oregon ore, from which 90 per cent of the assay value has been extracted by chlorination; second, that 85 per cent of the assay value of gold and silver may be obtained from the Calaveras ore by a one per cent solution, using 1½ parts solution to 2½ parts ore. I shall discuss the economy of the process further on. I was now reasonably certain that while the process might be made to work on some ores, the statement that it is without a peer as regards all refractory ores, and that "the most refractory ores can be treated for from \$2.50 to \$3 per ton," was not apparent from any actual test that I had seen. I was now desirous of finding out, if possible, why the process would extract so well from one ore and be such a failure on another. I thought this might be due (1) to the proportions of free gold mixed with sulphurets, or (2) to the chemical composition of the ore and its consequent action on the solution, or (3) to the manner in which the gold is imprisoned within the sulphurets, i. e., whether each minute grain of the sulphurets contained the gold in such a mechanical form as would expose every particle of the gold successively to the action of the solution, or whether the gold was so finely divided and so completely enclosed by the sulphurets as not to be subjected to the solvent action of the solution.

To test the first, I tried amalgamation and found that the Oregon ore yielded absolutely nothing, while the Calaveras ore yielded only a trace, i. e., about 4 per cent, while the zinc ore yielded 33 per cent of Au by amalgamation. I could draw no satisfactory conclusions from these investigations. I next obtained quantitative analyses of these ores, which were as follows:

Oregon.	Zinc Ore.	Calaveras Ore.
SiO ₂ 23.10%	SiO ₂ 49.31%	Nearly pure
Fe 36.50%	CuS 18	FeS ₂ + SiO ₂
S 33.60%	FeS ₂ 6.43	
Arsenic 6.30%	PbS 6.39	
Sb 522	ZnS 31.69	

From these again I did not dare to draw any conclusion, except as to the zinc ore, which will be given below, without experimenting with a greater variety of ores of similar composition.

Then I took one-half A. T. of each of the three ores and roasted with N_2HCO_3 , obtaining the metallic oxides and Na_2SO_4 . I then leached out the Na_2SO_4 , and treated the residues repeatedly with strong nitric acid, passing off the sulphur, etc. Then finally I examined the residues with a strong microscope, such as is used in petrographical work.

(1) The Oregon ore showed no trace of gold in any form.

(2) The zinc ore showed the gold to have occurred or collected into one minute filiform nugget.

(3) The Calaveras ore showed also a nugget, but in addition several granules of gold about one-tenth the size of the nugget.

I believe from the above investigations (1) that the gold in the Oregon ore is so fine and so completely unenclosed as not to be accessible in the raw sulphurets to the solution. (2) That zinc having the greatest affinity of all the known metals for cyanogen, rendered the KCN inert, according to the following reaction:
 $4 KCN + ZnS = K_2S + Zn(CN)_2 \cdot 2 KCN$, or possibly the formation of some sulpho cyanide; the main point being the union of Zn with CN by direct combination or replacement, and thus causing the process to become partially inoperative in the case of the zinc ore. (3) That the gold was so combined mechanically in the Calaveras ore as to be almost completely accessible in the pyrites; and gold having a greater affinity for CN than iron, would displace iron in solution, if the CN were inefficient for both. When I introduced KHO into a waste solution, after removing the gold, I obtained a precipitate of ferrous hydrate, which, on exposure, oxidized to the brown ferric hydrate, showing beyond the possibility of a doubt that some iron had gone into solution.

Solubility of Gold.
Noticing that Dr. Johnston, the chemist of the State Mining Bureau, found that it took dental gold 48 hours to dissolve in a quiescent solution, and also that the amalgamation results on the zinc ore would indicate considerable free gold, I tried 26.46 mg. gold in the amount of solution that would be used on that amount of gold, if contained in five assay tons, i. e., about \$100 ore, on which the process is said to be most successful. That is, I took 5 x 18 cu. cm. or 90 cu. cm. of one per cent solution, and found that at the end of eight hours shaking it had entirely dissolved, thus showing that if

the gold was free and accessible in the zinc ore, as the microscopic examination would indicate, it would have dissolved had the KCN been active and no zinc present.

Economy of the Process (Without Regeneration).

The most favorable ore experimented on as assayed in gold 2.32 ounces to the ton, and in silver .72 ounces. Of this was extracted, with a one-half per cent solution, nearly equal weights of ore and solution, 84.5 per cent of the gold and 66.7 per cent of the silver. Counting gold at \$20 per ounce, and silver at \$1 per ounce, the assay value of the concentrates was \$47.11. In chlorinating according to the reduction works in California, a return of 90 per cent would be made at a charge of \$20 per ton. That is, \$22.40 would be returned. Now in the following estimate I do not claim strict economy, but only the closest approximation that I am able to make. The prices for KCN and zinc were given me by a well known dealer in San Francisco and were for large quantities. For one ton ore according to above, we would need 2000 pounds multiplied by one-half per cent, equaling 10 pounds pure KCN. Now cyanide of soda is said to contain 60 per cent KCN, therefore would require 16½ pounds cyanide (which is the cheapest of the three grades sold per percentage of purity) at a cost of 45 cents a pound. That is at a cost of \$7.50. The replacement of the gold by the zinc ore but very little sheet zinc, which may be obtained for 7½ cents per pound. It would seem that a superintendent and one laborer could tend to a plant capable of reducing 10 or 12 tons a day, and the power required is very slight. To make a liberal estimate, including the consumption of zinc, and without taking into account the regeneration of the solution, which point I did not hear of in time to look into, I should say that \$10 per ton would easily cover the running expenses of a plant to reduce the above sulphurets. The first cost of plant where the ore has already passed a 40 mesh is very slight, merely consisting of revolving herrels, or tubs with stirrers, filtering tanks and zinc filter, with a few storage tanks. The above estimate, if correct, means a return of \$37.11 per ton in place of \$22.40. I need hardly call attention to the obvious advantages possessed by the process as regards mechanical manipulation. By far the greatest, however, is the doing away with the expensive and disagreeable roasting furnace. The filtering in the case of sulphurets is ready and would seem to possess no difficulty. But as for the process being a panacea for all rebellious ores, I do not think the experiments of the owners themselves, some of which are as low as 65 per cent, show that, and I am certain that mine have not.

In the above I am aware that many of my deductions may have been hasty, and I would be pleased to hear from any one on any such point.

A Stockton Gas Well.

The Stockton Mail says: Work on John Jackson's gas well, located south of the City Homestead has ceased.

The well is now 1679 feet deep, and is regarded as finished. Should it be desirable at any time in the future to sink it further, however, it can be done, for the diameter at the bottom is eight inches.

The flow has not been accurately measured as yet for two reasons. The first is, no meter capable of measuring it can be obtained here; the second, the arrangement for confining the gas for measurement, is only a makeshift, and a large volume goes to waste. From what measurement could be obtained up to the present time, Mr. Jackson says the flow is from 75,000 to 100,000 cubic feet each 24 hours. He intends to place a gasometer over the well at once and utilize the flow.

"I propose," he said, to a representative of the Mail, "to lay a distributing system of pipes and sell the gas for fuel and illuminating purposes."

"Throughout the City Homestead?"
"I intend to supply not only the Homestead but the southern part of Stockton also. The Stockton Gas, Light and Heat Co. does not run its mains through that part of the town lying south of Mormon channel, so there is a good field open there for a separate system."

"But will you have enough gas to supply that field and the Homestead?"

"Well," was the answer, "if the flow isn't large enough there is plenty of room out on my piece for boring another well."

Mr. Jackson stated that the gas would be in use in the Homestead and the southern part of town within two or three months. He proposes to rush the work as fast as possible. He does not intend to secure guarantee of patronage to a certain amount before laying pipes, but will proceed with the work of laying mains without soliciting patronage in advance, being confident that consumers will apply for the gas of their own volition.

CHIEF Shift of the Worlds Fair Department of Mines and Mining, has assumed the duties of his office, and already has his hands full of work. N. P. Calvo of the United States of Columbia called at headquarters, and will secure space in the Mines and Mining Building for an exhibit from his country. The mineral exhibit from that country, he says, will be something unusual. Everything will be embraced, from the finest platinum to the coarsest iron.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

RICH ROCK.—*Ledger*, July 4: A. Mello brought to Jackson, on Wednesday, a sample of quartz taken from a claim owned by him and Alex Questa and M. Arata at Jackson Gate. The rock is sprinkled with free gold, and is as rich a specimen as has been taken out hereabout for a long time. Such quartz would yield considerably over \$100 per ton. It was taken from a depth of 50 feet. The ledge is reported to be eight feet wide, all of it of good-paying character. They have 150 tons of ore on the dump. The owners are all poor, and unable to bear the expense of putting up the necessary works to operate the mine. It is worthy of the investigation of capitalists seeking investments.

Calaveras.

THE FINNEGAN MINE.—*Mt. Echo*, July 3: John Finnegan formerly of this town, more recently of San Francisco, has commenced operations on the Finnegan mine at Carson Hill. This mine was discovered about the year 1856 by Mr. Finnegan himself and has been worked continuously since that time. Since the discovery of this mine there have been immense sums of gold taken out of it, and the mine is to-day one of the best in the country. Mr. Finnegan, the superintendent, tell us that he intends to commence sinking a shaft as early as possible.

RUMORED SALE.—*Mt. Echo*, July 2: It is reported that the Union Mine has been purchased by a syndicate in New York city and that all the copper mines that were worked here in the 60's will be opened up again, thereby giving employment to 150 more men.

El Dorado.

ACTIVE.—*Mt. Democrat*, July 4: The mining interests of El Dorado county seem to be growing quite active of late, and enterprises are being inaugurated in different parts of the county. Considerable feeling is being manifested in the Baltic district. At the Blue Gorge mine three tunnels have been run, crosscutting the vein, which seems to be 100 feet wide between walls. The entire vein is composed of material of low grade. There are several distinct ledges of quartz, varying in width, running lengthwise through this large body of gold-bearing material, the quartz being of better grade. The lowest tunnel now being run, cuts the vein at a depth of 100 feet and shows improvement in quality. A lower tunnel is in contemplation, which will cut the vein 700 feet below the surface. At this depth it is supposed, by experienced mining men, that the several quartz ledges crosscutted near the surface will be combined, forming a ledge of one, over 30 feet wide. This belief is justified by the developments already made.

THE BALTIC mine, in the same district, has a shaft down 120 feet, from which 110 tons of ore have been taken. Fifty tons of this ore was worked with an arrastra and yielded 80 ounces of retorted gold. During the run 16 pounds of quicksilver were lost, which evidently carried with it a large percentage of gold. The owners of the mine, Charles Varozza and L. Campini, are pleased with the result of the run, notwithstanding the heavy loss of gold, for want of experience in the manipulation of ore. The Scironi mine in the same district has 100 tons of ore on the dump, which according to tests made, will pay \$12 per ton. Other ledges in the district are being prospected. The Rosebud mine, in Brownsville mining district is a recent discovery made by Wm. Loupoule, and promises well, the ore showing considerable free gold. The Parker, in the same district, has a tunnel run through a body of good ore 200 feet long, three to five feet wide, Mr. Chas. Parker came down last Tuesday for additional machinery for their mill. At the Epley, belonging to the Pacific group, in Placerville mining district, a tunnel has been run in from Seallars ravine 200 feet, opening a vein eight feet wide, of good ore. The Gentle Annie, at Poverty Point, is running steadily and making its regular output of bullion. The Landecker gravel mine at Weaver Hill has a breast of rich gravel four feet thick and 200 feet wide. Capt. Newton commenced opening up the Darling mine, near Kelsey this week. The Martin & Ambro mine in the same district, has also commenced development work.

OUR SLATE quarries are crowded with orders for roofing slate beyond their capacity to fill. The wonder is that sufficient capital is not invested in this important business to open up the quarries and put in machinery with capacity to supply this growing demand.

GRAND VICTORY.—*El Dorado Republican*, July 2: A mining expert was in the county last week sampling some of the ore and tailings from the Grand Victory mine, the object being to ascertain whether a process could not be devised to save the gold contained in the ore and make the mine profitable. It is said that his experiments were satisfactory and may lead to the resumption of work on this mine.

BALTIC.—Charley Varozza and partner brought down from the Baltic mine last week 80 ounces of very pretty gold, taken from 50 tons of Baltic ore. They worked this ore with an arrastra and evidently lacked experience in working ore, as they lost 16 pounds of quicksilver during the run, and no telling how much gold, but certainly a heavy percentage.

Inyo.

A RICH STRIKE.—*Independent*, July 3: A letter received from Darwin yesterday states that a rich strike of ore has recently been made in the Promontory mine. In past years this mine has yielded thousands of dollars and there is a strong belief that the present strike will be as valuable as any discovery yet made. A short time ago Mr. Waterman sent two men there to do assessment work. They went down the old incline 20 feet and started to drive toward the foot-wall. After going in about four feet, they struck a fine body of lead ore 2½ feet thick. It assays 130 ounces silver and 50 per cent lead per ton. The new ledge dips about 10 degrees more vertical than the old incline. If this new strike realizes the expectations of its discoverers, it will make lively times in Darwin. The Promontory is owned by Messrs. Waterman, P. Reddy, J. S. Gorman and the Eddy estate.

HIRSH MINE.—*Index*, July 1: A visit to the

property shows it to be in good condition and paying well, although worked in a small way. About 35 tons of silver-lead ore has been shipped in the past three months, and has paid handsomely. The ledge now shows four feet in width of nearly solid quartz, the galena being found on the footwall. There are hundreds of thousands of tons of gold-bearing quartz in sight, which will pay to work with a mill at the drop of the Inyo canal and cheap methods of transporting low grade ore from the mine. The Hirsh has all the elements of a lasting dividend paying mine.

PANAMINT.—*Register*, July 2: S. P. McKnight has returned from Mesquite springs, out in Panamint country, and reports mining interests out there as looking indeed hopeful. At Modoc, Frank Fitzgerald keeps about 20 men steadily employed. At Panamint there are about 18 chloriders regularly working. The Surprise Valley mill recently made a run and highly satisfactory cleanup on ore furnished by the chloriders, some of the rock assaying way up in the hundreds of ounces of silver. A San Bernardino company is working claims upon some of which Mr. McKnight has been surveying. In one of these, the Anaconda, a seven-foot tunnel is now being run in solid 60-dollar ore. The body was struck after tunneling through 30 or 40 feet of barren quartz. It appears to be of considerable size, as no walls have been struck and the face of the tunnel is in ore. The entire country abounds in mineral and will become a lively section and good tributary to any railroad that will penetrate it. Like Owens valley, communication is the one thing needful.

Nevada.

RICH ORE FROM THE WISCONSIN.—*Grass Valley Tidings*, July 4: Eslick & Co. having abandoned the contract to sink the Wisconsin shaft, the owners of the property late last week put two men to work on day's pay. Two candle-boxes of rich ore were found underground, and Saturday, in sinking, a carload of ore almost rich enough to be termed "specimen" was extracted. The gold is coarse and lots of it is shown, while the rock abounds in other mineral and possesses generally that "lively" appearance so much esteemed by miners. The shaft on the Wisconsin is down 180 feet, and the ledge averages 14 inches in width. The claim is a part of what is known as the Menlo property and is undoubtedly a first-class possession.

RIVER MINING.—*Grass Valley Union*, July 8: Thos. C. Bourn was up from Pleasant valley yesterday obtaining supplies for the camp that his company is establishing on the Yuba below Bridgeport, to work the bed of the river this season. The river is now low, as but little snow is left in the mountains to keep it up, and in a week or two it will be down to the lowest summer stage. The work of putting in a wing dam, to turn the course of the river will be commenced in a few days. Besides this company, which consists of white men, several Chinese companies will work the river bed in the same vicinity.

Plumas.

A NEW MILL.—*Greenville Bulletin*, July 2: From Mr. Garland we learn that Messrs. Sutton, Orr, Braden and Larison are opening up, a quartz mine back of Snake lake, once known as the Jackson ledge and worked by the arrastra process. They are now building a road so that the ore can be hauled to a five-stamp mill which they are erecting above Maxwell's, in Butterly valley. The ore is said to prospect very well and the owners are confident of securing good pay. Alex. Cameron, superintendent of the Feather River G. M. Co., was in town Monday, and from him we learn that an important development has been made in the lower tunnel of that mine. They now have a good strong vein of quartz which prospects exceedingly well. He says that 20 stamps of the mill will be started as soon as water can be brought in for that purpose. The water will probably be brought in from Ohio creek. The work of sinking the shaft at the Crescent mine continues with that system and steadiness for which Superintendent Whitney is noted. Reasonably good progress is being made. Joseph Gruss is operating the Genessee mine, the usual force of men being employed in extracting ore and operating the mill. The owners of the Glazier mine on the North Fork have been extending their lower tunnel and have broken into a good bed of gravel from which good pay is reported. A small force of men is working at the Indian Valley and it is rumored that some important developments have been made. John Taylor and others are preparing to start the Arcadian mill on ore from a mine in Round valley owned by H. Gansir and others.

GREEN MT.—*National*, July 4: The Green Mountain mine, situated above the Crescent mine in Indian valley, has changed hands. Mr. G. P. Cornell and Col. W. T. Smith, of S. F., becoming the owners. Work in the way of clearing out tunnels, and making general repairs commenced the first of the week, and when once got into good working shape, there will be lively times again at this old camp.

San Diego.

JULIAN AND BANNER.—*Julian Sentinel*, July 2: The Chloriders of the Warlock mine have had another crushing of ore put under the Helvetia stamps, which panned out \$34 per ton. The Chaparral boys are awaiting the pleasure or leisure of the Helvetia mill to crush a fine lot of ore. Mr. Havermale is keeping the stamps pretty busy on ore from the High Peak and it is only between times that the boys can get in their work. Preparations are being made to start up the Owens mine by H. A. Williams. Word has been received that the Gold King and Queen Co. will soon resume operations on these properties on a more extensive scale than heretofore. The force at Stonewall has been increased and the steady output of the mine is growing every month. Dr. Valle of San Diego is interested in the Three Brothers mine, and is here for the purpose of commencing work.

Shasta.

ANOTHER MINING SALE.—*Shasta Democrat*, July 1: Another important sale of mining property was closed last Thursday afternoon. The Mammoth mine, with both extensions east and west situated in Old Diggins district and adjoining the Central, owned by Frank Young, Lawrence Garrecht and Frank Panter, was sold to P. J. Torney, a commission merchant of San Francisco, for \$45,000. The first payment of \$5,000 was paid Thursday and the other payments will be made in two installments at stated periods. Mr. Torney is one of a company of San Francisco and Eastern capitalists. Mr. Morton, formerly superintendent of the Walker

mine, who negotiated the sale, took possession of the mine Friday as superintendent for the new company, and will proceed to develop the mine on a large scale with the intention of putting up a large mill in the near future. This sale adds one more strong mining company to the mining enterprises of Shasta county, and we congratulate the former owners of the property for making the sale.

IRON INTERESTS.—*Redding Free Press*, July 4: It has always seemed strange to us that the fine body of iron ore, known to exist at Iron mountain on the McCloud river, has not been utilized. Some nine years ago action was taken by an organized company to open up the deposit, and, in fact, much land and water rights were secured. From Robert Radcliff, who was in Redding Wednesday, we learn that he is the appointed agent of the company in this county, and that through him the assessment work has been done from time to time. Now he has an order for two carloads of the ore to be shipped from Smithson, 11 miles distant, to which point the ore will have to be hauled in wagons. Mr. Radcliff showed us letters and telegrams instructing him to ship two carloads at once, and he was here this week to secure teams for that purpose. The ore will be shipped to the Pacific Rolling Mills, San Francisco, and if satisfactory, several thousand tons will be ordered. The mine is located one mile from the United States Fishery. About two carloads of ore have already been mined. It is only necessary to blast out and quarry the rock. Lying on the steep mountain side, the mine can be worked to the best advantage.

Sierra.

NORTH AMERICA.—*Mt. Messenger*, July 4: We learn that the North America mine, at Hepsidam, has been put in good order for working. Under the supervision of the Executor of the last will of Miles Schofield, deceased, the tunnel has been re-improved wherever it was needed, and other improvements effected, which would seem to indicate that active operations are to be renewed.

TO BE DEVELOPED.—*Mt. Messenger*, June 27: A company of San Francisco capitalists has taken hold of the Ante Up Quartz Claim, located near the Mountain House, and the work of development has begun. A boarding house is being put up at the mouth of the old tunnel, in Woodruffe Creek, that will accommodate 15 or 20 men, the first mentioned number being all that will be likely to be needed for some time. The lumber used is bound together with wire and lowered away down the steep hillside to where it is needed. A tunnel was run on the property some years since, a distance of some 1200 or 1500 feet. This tunnel will be repaired and extended. The ledge to be developed is the Brush Creek ledge, which was remarkably rich as far as worked. When the tunnel is again open to the ledge, drifts will be pushed both ways along it. R. H. Judson is in charge of the work which will be pushed as rapidly as possible.

Siskiyou

WILLOW CREEK.—*Telegram*, July 3: Sydney Richardson of Willow Creek invited the *Telegram* representative to take a trip to that part of the country and see the many new mines that are now being opened there. A company from Sacramento has lately started operations there on an extensive scale. A Portland Co. also made locations there and will push operations immediately. The coal mines also being developed more extensively than ever, and continues to show indications of a permanent deposit of superior coal. The Willow Creek section is rapidly coming to the front as a mining locality. The Yreka Blue Gravel Co. continue to find blue gravel, which goes to prove that the deposit is a permanent one, instead of a thin layer as many supposed. They are working day and night and will soon know exactly what they have. At any rate everything at present is as favorable as could be desired. Such of the mines on Humburg as are enabled to work at all, are giving flattering returns to their owners, showing that Humburg still holds her high position as a mining locality. On the Klamath nearly all the miners are working away with more or less degrees of success, and many of them are doing quite well. At Scott Bar and Hamburg Bar nearly all the principal mines are shut down through failure of the water supply. The mines of Steele & Co. and Bennett's are doing very well. George Blessing has recently found some very good prospects on Humburg gulch, about a mile and a half west of Yreka. Considerable prospecting work is being done by miners on the hills west of Yreka.

RIVER MINING.—*Yreka Journal*, July 27: M. K. Thomas, Superintendent of the Beebe Bar mine, Klamath river, is fixing up the claim in fine style for successful work. He has dammed the river about 80 feet of its width, running a wing dam down stream over 200 feet, besides making a race in which he has the dip wheel, derrick wheel and pump wheel located. The derrick boom will have a swing for dunnage of pay gravel with the greatest ease into the sluices, and for dropping great boulders and other refuse beyond the race into the main body of the river. This claim is owned by J. S. Cleland of this city, who intends operating it on an extensive scale, with a firm belief that it will pay handsomely, as it undoubtedly will. The late rain showers dissolved the snow so rapidly on the Salmon range, that the supply of water in the ditches to Quartz valley and Oro Fino, is very light, which will make the season rather short for mining. The frequent rains this spring and summer up to this time have proven very effective however, otherwise the season would have been much shorter, on account of the extraordinary light winter. The work of sinking the shaft in the Yreka Blue Gravel Co.'s mine, just south of town, is progressing gradually, with day and night shifts, and in a few days more, an extra hand will be added to each shift to reach the bedrock more rapidly. The blue gravel becomes coarser with better indications of gold, the deeper it is prospected. The compartment shaft will enable the men to have good air circulation all the way down, no matter how deep, as a current of fresh air can be worked down whenever needed, or in case of any foul gases or damps being reached. Frazer & Co., of Indian Creek, are now taking out considerable quartz to keep their mill running constantly, the quartz averaging about \$5 a ton.

KNOW NOTHING CREEK MINES.—*Trinity Journal*, July 4: D. Hanson returned Sunday from Know-Nothing creek where, with other Trinity people, he is interested in several good quartz mines. We are indebted to him for the following items:

The Hansen mine, owned by D. Hansen and August Dannenbrink looks well and development work is now being done on the property. The ledge is about four feet wide and prospects good. At the Know-Nothing mine everything was activity. Fourteen men are employed and the four-stamp mill is kept grinding away on quartz night and day. The cleanups have been very satisfactory, and the company will now have the pleasure of enjoying a dividend regularly hereafter. The expense of getting this valuable piece of property in shape and on a paying basis has been great. The ledge carries from three to seven feet of quartz and looks permanent. It is more than probable that four more stamps will be added to the mill before winter. The mine is owned by Riley, Bennett & Hanson. The Gold Run mine, the property of the Dannenbrink Bros., R. Jankans and D. Hanson, is looking fine. The ledge is from six inches to four feet in width and the rock prospects well. From 10 to 14 men are employed. They have been running a tunnel on the property. Mr. Hansen says he never saw the mines looking so well, and is very sanguine that in the near future that camp will boast of several dividend-paying properties.

NEVADA

Washoe District.

ANDES.—*Virginia Enterprise*, July 4: North drift from east crosscut No. 2 on the 420 level has been advanced 20 feet; face in quartz yielding low assays. East crosscut from the north drift on the 420 level advanced 17 feet. Face in quartz yielding low assays.

UTAH.—The south drift from the bottom of the winze station has been extended 44 feet; total, 56 feet. This drift having passed into quartz, we are following it laterally instead of crosscutting west, as contemplated a week ago.

SEG. BELCHER.—West crosscut from south lateral drift on 600 level has been advanced 22 feet, and is now out 177 feet; face in soft ground composed of porphyry, clay and low-grade quartz.

JUSTICE.—There has been no work done in the 820 level north drift since last report. Shipped 164 tons of ore the past week, worth \$17.02 a ton as per battery samples.

KENTUCK.—Have stopped the east crosscut from the south lateral drift from the east raise, 1000 level, in the hanging wall. Started a north drift from the raise opposite the south drift and are out a distance of 17 feet; face in quartz of low grade. The west crosscut from the top of the north raise has been advanced eight feet; face in quartz showing spots of ore. Have continued the raise from the 950 level eight feet, and are up 29 feet; the top is in low-grade quartz.

BELCHER.—The raise from the south lateral drift from No. 2 crosscut, 200 level, has been advanced 40 feet and is now up 96 feet; the top is in a mixture of porphyry and low-grade quartz. The south drift from the main west crosscut from the shaft, 300 level, has been extended 26 feet and is out 330 feet; face in porphyry with streaks of low-grade quartz through it. Have stopped the 1500 level east crosscut in the hanging wall, and have started in an east crosscut from the north lateral drift on the 1300 level, which is out 24 feet in low-grade quartz.

CROWN POINT.—The south lateral drift from the 300 level south winze has been advanced five feet; the greater portion of the time has been occupied in timbering; the face is nearly all in clay. Have resumed work in the face of the 500 level west crosscut, which is out 195 feet; the face is in porphyry, clay and small streaks of quartz. The east crosscut from the south lateral drift on the 1000 level has been advanced 18 feet, total, 205 feet; face in porphyry and clay.

SCORPION.—The joint north drift from the 900 level of the Union shaft was advanced 21 feet; total, 165 feet from shaft station. Formation passed through is porphyry and slips of clay; face of drift shows seepage of water.

SAVAGE.—Milled five tons of ore worth \$18.50 a ton, as per battery samples. Bullion on hand, \$27,331. On the 1100 level the north drift from the Hale & Norcross side was advanced 12 feet; total, 178. The grade of the quartz in this drift has improved the past week—the last eight feet of the drift is all in fair-grade ore which is being saved for pay.

HALE & NORCROSS.—On the 1500 level the south lateral drift was advanced 25 feet; total, 140 feet from station; face in porphyry and seams of quartz. The north lateral drift on this level was advanced 15 feet; total, 170 feet from station. No. 1 west crosscut started at a point 75 feet north from the incline was advanced 27 feet; total, 40 feet. This drift exposes a strong body of low-grade quartz; 75 feet north of this crosscut we have started No. 2 west crosscut, and advanced same to feet, all in quartz, carrying some streaks of ore. We have completed chutes for waste and pay rock below the 1500 station, and have resumed work below this point in the main incline.

UNION SHAFT.—The west drift from the shaft, 900 level, has been advanced during the week 55 feet, making a total distance of 530 feet; face is in clay and porphyry.

SIERRA NEVADA.—630 level west crosscut No. 1 from northwest drift 571 feet from the shaft, is advanced 35 feet; total, 571 feet. The Kenosha tunnel was enlarged and repaired 52 feet during the week. Total, 312 feet.

NEW YORK.—The 600 level north drift is out 275 feet north of shaft; face in porphyry. North drift, 1100 level, is in 568 feet north of shaft. Formation, quartz yielding low assays.

SILVER HILL.—Southwest drift, 50 level, is out from the shaft 164 feet; face is in clay and porphyry. South crosscut, 160 level, is out from the winze 614 feet; face in hard porphyry.

WARD SHAFT.—The south drift from the 1800 level station is out 130 feet; face in porphyry.

CHOLLAR.—The south drift, 1400 level, is out 183 feet from the north line; face in porphyry. The joint winze in east crosscut, 1400 level, is down 98 feet. The bottom is in porphyry and quartz.

BULLION.—The south drift, 1300 level, advanced 33 feet during the week; total length from north line, 193 feet; face in porphyry.

EXCHEQUER.—East crosscut on north line, 600 level, is out 246 feet; face in porphyry and clay.

ALPHA.—North drift from west crosscut, 100 feet north of shaft, 600 level, is out 21 feet; face in quartz.

POTOSI.—The south drift from Chollar incline, 1100 level, connected with the north drift from the

wine during the week. The wine is down 189 feet below the 1400 level. The bottom is in porphyry and quartz.

Hawthorne District.

LAPANTA.—Walker Lake Bulletin, July 1: Still raising and stopping above the east drift of No. 6 incline, vein showing about the same; producing as usual; incline still being extended; vein about the same; stopping above the tunnel, and extended the northwest drift, both of which show very well.

PAMILCO.—Main tunnel being driven ahead, now 35 the past the chute, ground snifter. Lessees still extracting ore from the stapes at the north end of the mine.

CENTRAL.—Have resumed sinking the incline below the 150-foot point; the vein of ore veing about two feet wide, carrying 25 per cent lead, 50 ounces silver, \$35 gold. Stopes above 75-foot level producing as usual. Hoisting ore for shipment at present.

MOUNTAIN KING.—Main tunnel still being extended, face 72 feet beyond the first ledge; formation talc and quartz.

HARTFORD.—Sinking on vein still continues; producing lead, silver and gold ore as usual.

BEACON.—Still stopping from incline; producing the usual amount of ore.

GOLD BAR.—South drift, Martinez tunnel, been extended 12 feet during the week; ledge strong, producing considerable rich ore.

CONFIDENCE.—New incline down 48 feet; ledge about 2 1/2 feet wide, carrying considerable quartz, some silver and considerable copper stain coming in, indicating proximity to ore.

FAIRMOUNT.—During the week the main south drift has been extended eight feet vein showing about the same. Incline below the drift shows vein from six to eight inches wide; ore running from 300 to 400 ounces. Shipment made this week to Mt. Diablo mill.

CHALLENGE.—Main tunnel being extended. Shipped six tons to Mt. Diablo mill this week. First class 177 ounces.

NEW YORK.—Still extending the drift.

CAPITAL.—Main drift being extended on the vein; showing large formation streaks of ore through it.

JENNY LIND (Marietta).—Shipped a carload of sulphuretted silver ore to the Mt. Diablo mill this week.

RIP VAN WINKLE (Marietta).—Main tunnel being driven on the vein to the east, is now in 170 feet, following the vein. It shows ore all the way, as the vein is followed east, the grade in silver is found to increase. Lead about the same—65 per cent.

Tuscarora District.

DEL MONTE.—Times Review, July 3: Third level: Joint west crosscut extended 10 feet, will reach the vein this week.

NAVAJO.—South intermediate drift has been extended 12 feet, the vein is not showing quite as well. The 350 stopes look about as usual.

COMMONWEALTH.—Fourth level: North drift from east crosscut extended 11 feet. No. 2 raise from north drift up 10 feet in the vein. No. 1 winze has been started to prospect the ore exposed in north drift.

NEVADA QUEEN.—South drift from east crosscut, fourth level of Commonwealth, extended 10 feet. West crosscut advanced 10 feet. East crosscut 10 feet to hanging wall, exposing 18 inches of low grade ore laying next to the wall.

BELLE ISLE.—North drift from the west crosscut, 350-foot level, has encountered a break, the ore up to this point is very fine. Have resumed work in the line crosscut, same level, progress 25 feet. Have started cutting out for a winze on the west vein. The stopes above the 350-foot level are looking well and have yielded 19 cars of first-class and 43 cars of second-class ore.

NORTH COMMONWEALTH.—First level: Produced 9 cars ore, average car sample assay \$359 per ton.

NORTH BELLE ISLE.—East crosscut, 450-foot level Belle Isle, extended 20 feet, rock breaking well and looks favorable for ore. No. 2 crosscut, 400-foot level, extended 13 feet, rock quartz and gives low assays. West crosscut, 600-foot level, extended 14 feet, rock very hard. East crosscut, same place, extended 21 feet, face getting harder and shows seams of spar. The stopes on the 400-foot level are extending gradually farther south.

Jackrabbit District.

JUNCTION TUNNEL.—Pioche Record, July 2: The ore body encountered in the Junction tunnel at the Day mine, of which mention was made last week, has materially improved during the past few days. The latest reports state it to be five feet wide, of a soft character, easily mined and assaying upwards of 100 ounces in silver per ton. This adds another magnificent ore body to the number already uncovered there by the work of the present company and makes more certain the fact the Day mine is one of the greatest and best in this vicinity.

Bristol District.

COPPER FURNACE.—Pioche Record, July 2: From Wm. J. Roe, who was in from Bristol to-day, we learn that the small copper furnace which he and his brother Charles L. have been at work on for a month past, is about completed and that work will begin about the last of this month. The furnace is located at the old Kattenhorn well, below the mill of the Bristol Co., and is of five tons capacity per day. The ore to be worked lies on the dump of the Cave mine in Bristol district, five miles from the furnace. The first run will produce about 15 tons of copper of high grade as was determined at the successful runs on the same quality of ore which the Roe Brothers made at the same place two years ago.

Montgomery District.

FROM BREFYFOGLE.—Walker Lake Bulletin, July 1: M. T. Plamanez, who has just returned from the Breyfogle company, furnishes the following items: Angus MacArthur, late of Candelaria, is foreman for Montgomery. About 35 men are now employed by Montgomery, 24 in the mine and the others at the prospecting mill and in building roads. Wages are \$4 per day, board \$10 per week. A blacksmith shop, tool house and other buildings are under way. The material for a hotel building has been ordered. In clearing for the foundation of the blacksmith shop a boulder was encountered which yielded \$3000. One of the five partners interested with Montgomery has sold out his interest for \$15,000 and returned to San Francisco. Water is to be brought into the camp at once. A pipe line will be laid from a spring five miles distant. It is a settled

fact that a 20-stamp quartz mill will be put in Montgomery this fall. As work progresses and depth is attained in the ledge the ore body is widening out. add New Mexico

BIG OPERATION.—Silver City Enterprise, July 3: One of the most gigantic and best managed mining operations in the southwest is the working of the Confidence and Blackbird mines on Silver Creek in the Mogollon mountains. The main adit level is now in 980 feet, showing a continuous vein of an average width of eight feet. For by far the greater part of the level the vein is in good grade of milling ore and for the last 400 feet, the ore body has been continuous and averages about seven feet in width. Three shafts have been sunk from the apex of the vein on the hill above to intersect this main level, two of the shafts have already made connections and the third will be sunk to reach the level when 120 feet more is driven. The third shaft is now down over 200 feet and is being steadily worked to reach the point of intersection at same time as reached by the level. The management shows good judgement in their mode of procedure. Estimating on a conservative basis over 100,000 tons of pay ore is now blocked out and in sight above the main level, while a winze of 90 feet in depth below shows the vein stronger and of higher grade than above. The intention is to carry the adit in a farther distance of 400 feet, when arrangement will be made for the construction of a mill of sufficient capacity to handle the enormous ore bodies exposed in the mine. The water power of Whitewater canyon, some 12,000 feet distant will be utilized, the mill will be placed immediately at the mine and the force transmitted from the water power by dynamos and cable to the mine. This will be a novelty for the mining people of the west, and there is probably no other such plant in use in America, although one of similar construction has been in use in Australia for years past. [There are several such plants in California. Eds. Press.] With the vast bodies of rich ore developed in the mine and the efficient and economical method of reduction contemplated, there is little doubt that the Confidence will be such a success as to engender a feeling of emulation in other mining companies and lead to great and permanent good to the mining industry of the whole State.

ARIZONA.

BLACK HORSE.—Journal Miner, July 4: A large body of very high-grade ore was struck in the Black Horse mine on Sunday. This property has yielded good shipping ore whenever worked, and promises to continue its reputation under the present management of Mr. Hall. The United States M. Co., recently organized by English capitalists to operate in this county, has a force of 12 men prospecting different claims in the mountains west of Walnut Grove. We hear their prospects are looking excellent.

THE YUMA.—The Yuma Copper Co. feels very much elated over the news received in St. Louis from the property. The letter was written on June 7th, after a full day's run had been made with the smelter. The amount of bullion turned out was four tons. After the men get used to their work and the machinery is running smoothly it is expected that six tons of bullion will be the average daily output. Water continues to run 40,000 gallons a day, and the company is at present using 10 gallons. A shipment, the first in the history of the mine, of the first day's run was made on the 10th ult. A party of prospectors from the southern part of the territory, attracted by the Journal Miner's recent article in reference to the new mineral discovery near the Grand canyon, north of Prescott Junction, arrived at the latter place on Sunday evening. They were shown specimens of ore from the new discovery by Z. T. Phillips, one of the locators, and were well pleased with the appearance and left yesterday for National canyon. Several prospectors have gone into this new district recently. Messrs. Phillips and Healey, the original discoverers and locators of the mineral, have sent a small force of men to the canyon to develop their properties.

DAKOTA.

GALENA.—Deadwood Pioneer, July 2: Sam Moll, superintendent of the Hayes mine, is said to have torn down 50 tons of rock and ore—more or less rock—at a single blast, on Sunday.

FLOAT.—Coal is reported to have been found six miles north of Rapid on the ranch of Peter Finney, at a depth of 18 feet. Work will be resumed at the Keystone chlorination works to-day. The strike which was reported at those works is also satisfactorily settled. S. Matherson, one of the stockholders in the Richmond mine at Galena, arrived yesterday and left for the property. The works will no doubt resume operations.

IDAHO.

THE COW CREEK MINES.—DeLamar Nugget, July 2: This district, beginning about two miles west of DeLamar and extending northwest about four miles, has been much talked of since reports of big discoveries were made last fall. As soon as the snow was gone in the spring the country was filled with prospectors and a great many claims have been located. Some years ago a number of claims were located and considerable work done on Cow Creek, but the country then prospecting is some three miles east of the new section which is now attracting attention. Among the most promising of the claims in the new section, is one owned W. A. Seaton. This claim has been developed by an open cut, in which the ledge has been crosscut at a depth of 15 feet. The walls at this depth are apparently defined and the pitch of the ledge shown to be about 30 degrees from perpendicular. A seam of very hard quartz, a foot thick, next to the foot-wall shows high-grade silver ore. The balance of the ledge is of a softer decomposed quartz which is all good milling. Averages of a number of samples taken across the entire ledge show the ore to run upward of \$100 per ton. Extensions of this claim have been located both north and south, on croppings which can be traced on the surface, and some work has been done on them, but not sufficient to define the ledge. Three or four claims have been located east of this which are said to make excellent showings. Two miles or more southwest of this group Mr. Thomason and other parties have located claims which are said to promise well. About one

mile northwest of the Seaton mine is the much talked of Wellinger claim. From the appearances of all the claims from south of Seaton's to Farmer's, it is almost safe to predict that prospectors have made discoveries here which will eventually make a very rich mining camp. The quartz is certainly very high grade and the lode will probably show up a great width. This is the opinion of the Nugget expert, made upon his first visit to the district. He certainly can assert that there is enough now in sight to justify the investment of more capital in development work. The locations mentioned were all that were visited by our expert, but they do not include nearly all that properly belong to that district. The Homestake mine, and others lying between DeLamar and the claims visited, although not on the Cow creek side, are generally classed as a part of the district. They are all on a belt, or line, connecting with the DeLamar mines, and form conclusively the continuation of a great mineral zone from DeLamar northeast for at least five miles. If the end of the belt reaching in this direction should develop as good as it now promises, it will certainly establish DeLamar as the center of the greatest mining district in Idaho, if no more.

LOWER CALIFORNIA.

COPPER.—Lower California, July 2: One of the coming bonanzas of Lower California is the Francesa copper mine in Trinidad valley, 115 miles southeast of Ensenada. It is said to be one of the biggest deposits of copper in the country, thousands of tons of ore being in sight, and numerous assays already made prove the ore to be 68 per cent pure and showing the existence of both gold and silver. Mr. Tyack, an experienced mining engineer, once reported the Francesa as the most promising mine in this country. It is now controlled by H. A. Howard, Dr. O'Clery and others. When the railroad is built into Trinidad valley the Francesa will be heard from.

CEDROS ISLAND.—The Cedros Island M. and M. Co. has made a proposition to the Pacific Coast Steamship Co., owners of the steamer Newbern, to have that vessel stop at Cedros island on her trips to and from Mazatlan, guaranteeing that the steamer will be furnished a cargo of 500 tons of ore at the island on every up trip, the ore to be delivered in San Diego. On every south-bound trip the Newbern is to take supplies to the island. The owners of the Eureka gold mine in Guadalupe valley have sent a quantity of ore to San Francisco to be assayed. Ore from this mine has been assayed in San Diego, yielding a return of \$80 a ton, but for their own satisfaction the owners desire to have several tests made.

MONTANA.

A BIG PARROT DIVIDEND.—Butte Inter Mountain, July 1: The annual meeting of the Parrot Silver & Copper Mining Co., was held in this city to-day, and officers were elected for the ensuing year as follows: Pres., Franklin Farrell; V. P., S. T. Hauser; Sec. and Treas., J. E. Gaylord; Directors, Franklin Farrell, A. F. Mageon, Mr. Thurrell, S. T. Hauser, J. E. Gaylord, A. M. Holter, C. E. Tomlinson. The directors received the report of the officers, which was very encouraging. A visit was paid to the smelting plant and everything was found in first-class shape. No new improvements will be made to the property this year besides those in course of construction. At the smelting plant two new converters are being placed in position. The directors did not complete all of their business this morning and are in session this afternoon. The mine which has been closed down pending the erection of the new hoisting plant was started up to-day, in order to keep the smelter and concentrator in operation, which were running out of ore. The old hoist was used, however, the new not being ready yet. The most encouraging feature of the meeting was the declaration of an extra dividend of 10 per cent on the capital stock, aggregating \$180,000. This shows a splendid condition of affairs, and that the company is in a position to make such a liberal distribution among the stockholders, notwithstanding the new hoisting plant, regarded as the finest in the State, speaks volumes for the excellent management of General Manager Gaylord and Superintendent Ben Tibbey. The regular monthly dividend is \$8,000, or one per cent on the capital stock. Up to May the company was credited with \$840,000 dividends, and this extra dividend of \$180,000 brings the total up to \$1,020,000.

ENJOINED BY THE ANACONDA.—It is understood to-day that the Anaconda Co. has obtained an order from the court restraining and enjoining the owners of the Clark mine from taking out any ore. It appears that the Clark mine, which is owned by H. L. Frank and others, is situated south of the Green Mountain and Mountain Consolidated mines. A few days ago a rich body of ore was encountered in the Clark, and about thirty tons of the new strike was brought to the surface where the enjoining proceedings were instituted. Besides stopping the company from working their claim, the Anaconda Co. wants \$1,200 for the ore taken out.

NEW MEXICO.

IMPORTANT GOLD DISCOVERY.—New Mexican, July 3: Information of a wonderfully rich and extensive free gold discovery in the mountain district between San Pedro and Bernalillo reached the city yesterday. It appears that some three days ago a couple of prospectors who have long been at work on a quartz lead in that locality, and which is supposed to form the southeast extension of the San Lazarus gold belt, were knocking about over the hills when they came upon a deposit of decomposed yellow stuff, and, largely out of idle curiosity, gathered up a sack full of the same and began panning it. To their great joy as many as 100 distinct colors were found in the bottom of the first pan, and continuing their pleasant task, they found that each succeeding pan showed up still better. They were only about 12 miles northeast of Bernalillo station and there they went on the following day and carried several sacks of the ore, which was panned out there in the presence of an excited crowd of spectators, among others, Mr. Thomas, the A. T. & S. F. station agent, and Hon. M. S. Otero. The miners had in the mean time already staked off some 20 odd claims for themselves, and it was not long before the news spread and others were on the

ground. A great deal of excitement prevailed and is still on. That which makes the find more valuable is the fact that a splendid stream of water runs right through it, the stream being known as the Ojo de la Casa (spring of the house) from which it takes its source. There is a vast area of the mineral and it yields from 5 to 25 cents in fine gold to the pan. Already over 100 claims have been located. These facts are gathered from Hon. Amado Chavez, who arrived from Bernalillo yesterday. He examined samples of the ore and saw the gold panned out of it. Several parties left Santa Fe last night to investigate the matter for themselves.

OREGON.

MCARTHUR-FORREST PROCESS.—Oregonian, June 27: It is learned that the McArthur-Forrest process, of Denver, expect to make a second test on 100 tons of ore at the Eureka and Excelsior mines in Baker county, about the first of July. The well-known mining expert, John B. Farish, of Denver, will superintend the test on behalf of the company. Work on these well-known paying properties has been suspended for some time owing to some hitch in the plant. The new plant, put in at a cost of \$100,000, was defective and the McArthur-Forrest people have undertaken to remedy these defects with improvements of their own. They have already expended about \$8000, and now are about ready to make another test. This money is to be refunded to them by the company, if the new process proves a success. It is claimed for the McArthur-Forrest process that it can treat the ore at a maximum cost of \$6.50 a ton by leaching it with cyanide of potassium. This process is said to have proved a success with base sulphur ores in Australia and Africa, and it is believed that it will prove equally as successful here. If the test at the Eureka and Excelsior mines proves a success the company will adopt the process and erect a plant with a capacity of 100 tons per diem. These mines are in the Cracker creek district and they are the richest in Eastern Oregon. The owners are St. Louis capitalists, and Jonathan Bourne of this city.

UTAH.

NEW FIND.—Park Record, July 4: New finds of ore are becoming of weekly occurrence in this camp, there having been two since our last issue. The find of Rosscamp and Glenn, in Thayne's canyon, was the first and now comes news of a strike in the Pearl J. C., owned by Pat Lynch, Mrs. Hall, L. H. Farnsworth and others, and under verbal lease to W. H. Crockett. The ground lays just across the canyon from the Glencoe and considerable work has been done on it in the past. This spring Crockett obtained a verbal lease on the property and put a force of men at work driving a tunnel into the hill much lower down than any of the old workings. After running a distance of 50 feet he cut the vein, which carries a small streak of rich ore and gives every indication of leading to a large body of good shipping rock. The formation is porphyry and granite, very open, and possessing all the qualities necessary for making rich ore. The vein has the same course as all other veins in the camp, and dips to the northwest at about 40 degrees. At this writing very little prospecting has been done on the vein and it is impossible to speak definitely of its extent and permanency. This strike is another card for Blue Ledge district, which is rapidly coming to the front since the rich developments in the Glencoe.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

CAIN FRUIT AND NURSERY CO., July 1. Capital Stock, \$72,000. Directors—P. P. Cain, A. P. Jacobs, J. B. Agnew, C. H. Patchett and Geo. F. Beales.

PACIFIC FIELD SPORTS PUBLISHING CO., July 1. Capital Stock, \$45,000. Directors—John T. Corey, J. L. Corey, J. M. Carroll, J. P. and G. W. Reynolds.

GARDEN GRAVEL M. CO., July 1. Location, Calaveras Co. Capital Stock, \$1,000,000. Directors—F. I. Kendall, J. T. Carey, J. N. Thorne, N. S. Brown and Juan M. Luce.

BLUE LAKE LAND AND WATER CO., July 2. Capital Stock, \$1,000,000. Directors—E. J. Baldwin, R. H. Lloyd, Geo. W. Baldwin, W. S. Wood, and H. A. Unruh.

NORTH COMSTOCK DEVELOPMENT CO., July 6. Capital Stock, \$1,000,000. Directors—Monroe Thompson, S. E. Ward, L. B. Clark, W. L. Brown and Thos. Cole.

HAWAIIAN CONSTRUCTION CO., July 6. Capital Stock, \$100,000. Directors—A. Nelson, A. Rowe, J. Tuft, J. McKenna, and C. Thompson.

MERCHANTS MERCANTILE COLLECTION CO., July 6. Capital Stock, \$25,000. Directors—G. H. Umbsen, H. P. Umbsen, Z. U. Dodge, G. M. Perine and F. P. Latson.

C. A. WETMORE CO., July 3. Object, to carry on a general commercial, manufacturing, warehouse, commission, brokerage, factor and agency business, and incidentally to carry on and improve the fruit, raisin, olive, oil, orchard and vineyard industries. Capital stock, \$250,000. Directors—Charles A. Wetmore, Charles N. Felton, Charles K. Kirby, Maurice Clark and Clarence J. Wetmore.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

GEO. WILSON—Sacramento Co.

ARTHUR M. MITCHELL—Oregon.
N. M. NEWPORT—Oregon.

MECHANICAL PROGRESS

Recalescence in Steel and Iron.

Mr. F. J. Smith in the *Philosophical Magazine* gives an account of some new methods of investigating the points of recalescence in steel and iron. The object of the experiments was to discover the time connection which exists between the change of form (expansion and contraction) and the change of temperature. Several methods of experimentations were tried, and the following was the one finally adopted. The upper end of the steel wire to be tested was fixed vertically; the lower end was attached to a long light lever of aluminum, so arranged that a small change of length of the wire caused a large movement of the end of the lever, which traced a line on the smoked surface of paper rotating on an ordinary physiological chronograph cylinder. A platinum-rhodium thermocouple, twisted round the wire where it was heated, was in circuit with a galvanometer. By means of this combination the temperatures at which the changes of length of the wire took place were read. The movements of the beam of light reflected from the galvanometer were recorded on a moving photographic film.

The outcome of the experiments was that the changes of form of the metal under examination took place at the times of change of temperature, so that a curve so traced on the smoked paper can be used as an index of the changes of form and the changes of temperature. Thinking that it might be probable that these changes might be accompanied by some sounds at the critical points, the following apparatus was constructed: A mica disk was fitted into a circular recess turned out of a piece of wood. The steel wire under examination was attached at one end to the center of the disk, at the other to a vertical post. The front of the recess into which the mica disk was fitted was furnished with two sounding tubes. On heating the wire a certain temperature was reached at which a sharp crackling sound was heard. As the temperature was increased this ceased; then, on removing the flame, at the same temperature at which the first sound was heard, a second similar sound occurred. This took place at the point of recalescence. As the wire cooled this ceased, and then, when a temperature of about 490° C. was reached, a very sharp sound was emitted. This third sound appears to take place at the second critical point observed by M. Osborn. The wire used in these experiments was steel piano wire, annealed and straightened. The last experiment was also arranged so that the steel wire when heated should be in a strong magnetic field. Repeated trials showed that the sounds produced were in no way altered by the fact of the wire being in the magnetic field.

The Micro-Structure of Steel.

At a recent meeting of the British Iron and Steel Institute, M. F. Osmond of Paris contributed a note on the above subject, and presented to the institute a series of micro photographs, which were exhibited last year at the mining exhibition held at the Crystal Palace. Very mild steel is formed of polyhedral grains of almost pure iron, in each of which the iron presents a crystalline orientation, which is constant for the same grain, but which varies in the different grains. The grains of iron appear to be surrounded by foreign matter, osrhide of iron. As the temperature is raised, the grains at first increase in size without changing their form, then they become elongated and form a group of parallel bands.

In steel of medium hardness, the white portions consist of almost pure iron, and the dark portions consist of a mixture of iron and osrhide, the "pearly constituent" of Dr. Sorby. In metal properly heated and well worked, the pure iron forms torn-up and discontinuous strips, but when the temperature is raised, the formation of polyhedral grains becomes more and more evident, until the pure iron completely envelops these grains, and grows into them under the shape of fine parallel bands.

In hard steel, the pure iron behaves in a somewhat similar manner, but it is, of course, of much less frequent occurrence. He succeeded in obtaining for this metal a photograph, which shows, when magnified, 300 diameters, the alternately dark and brilliant strips, discovered by Dr. Sorby, and considered by him to be alternate lamellæ of iron and carbide of iron. Independently of any theoretical interpretation, one fact is clearly indicated by the photographs. This is, that each preparation defines not only the hardness of the metal, other things being equal, but also the temperature at which the metal was allowed to slowly cool. Moreover, as the structure and the mechanical properties are intimately associated, it can be easily imagined, without it being necessary to enter into fuller details, to what extent microscopic investigations may furnish useful information.

MECHANICAL STRESS OF STEEL.—Some interesting experiments were recently made in England, as given in a recent number of *Iron*, which show that, in the case of uniform longitudinal strain on a steel bar, there is a strain of the molecules, also of the elements, and a production of flow by a strain of the elements.

The elongation due to flow is, he says, the strain usually observed, and this may be either recoverable or otherwise; again, the strain of an element is made up of a uniform dilatation and a uniform shear about an axis parallel to that of the bar, and, therefore, the flow elongation consists of an increase of volume, together with a certain amount of sliding. The general conclusions arrived at by the author of these experiments are as follows: Mechanical strain produces an atomic disturbance in a bar, and this disturbance increases regularly with the stress; for small stresses the disturbance is only partly permanent, but as the yield point is approached it becomes wholly permanent; finally, the magnetic properties of a loaded bar are in general different from those of the same bar unloaded; but, notwithstanding this general fact, there is a certain stress, or range of stresses, over which the bar is found to have the same magnetic properties, whether it be loaded or not.

SPECIAL MACHINERY.—Much of the success attained by our people in manufacturing says a cotemporary, has been due to their use of special machinery, but it has been mostly of the lighter and smaller class, such as is used for sewing machines, small arms, and work of a similar nature. There is evidence that those who are doing the heavier work—large stationary and marine engines, locomotives, etc., are beginning to appreciate the advantages of machines specially designed for the work they have to do, and they are having them built of the heaviest and best character. The demand for traveling and heavy swinging cranes is also constantly on the increase, and no one who is engaged in building heavy machinery nowadays seems entirely satisfied unless he has a crane which will pick up his heaviest casting—and, in fact, usually his heaviest completed machine—and deposit it wherever it may be wanted. This is making a lively demand for larger and improved cranes.

MANUFACTURE OF HEAVY GUNS.—Preparations are about to be made at the Watervliet Arsenal for the construction of the first 16-inch gun for coast defense. Such a weapon would weigh 125 tons, and with a powder charge of 1000 pounds and a projectile weighing more than a ton, would have a maximum range of about 15 miles. Forty-four of these immense guns were included in the plans of the Fortification Board, and 36 of them are intended for the defense of New York, Boston and San Francisco. They will be mounted in pairs in turrets, commanding the principal water approaches of these three ports. The first 12-inch steel gun ever made in the United States has been completed at the above named arsenal, near Troy, New York, and shipped to the Sandy Hook proving-ground for testing.

THE WATER GRATE.—The *Locomotive Engineer* observes that there have probably been 40 patents in as many years of the water grate, as used on hard-coal burning locomotives and a few that burn soft coal. To those who think that to them or some of their friends belongs the credit for the original idea, it may be of interest to look back a few years. At the Museo Borbonico at Naples, Italy, there are carefully preserved many copper and bronze tools and utensils exhumed at Pompeii, and among them a small vertical boiler of copper; this has a fire-box and smoke-flue through the top, a door on the side, and water grates composed of small tubes of copper crossing the fire-box at the bottom. Pompeii was destroyed more than 1800 years ago.

ARMORED SHIPS NOT ALTOGETHER NEW.—The first account we have of an armored ship is in 1530. It was one of the fleet of the Knights of St. John, entirely sheathed with lead, and it is said to have successfully resisted all the shot of that day. At the siege of Gibraltar in 1782 the French and Spaniards employed light iron bomb-proofing over their decks. The first practical use of wrought iron plates as a defense for the sides of vessels was by the French in the Crimean war in 1853, to be used against the Russian forts in the Baltic.

STEEL IN CAR CONSTRUCTION is fast gaining ground. A committee of the Master Car Builders' Association has reported that there are now about 15,000 tons of pressed steel on cars in the United States. Pressed steel center plates are in use on 25,000 cars. Pressed steel freight trucks are being gradually introduced, the weight being somewhat less than the diamond truck for 30-ton cars, while they are furnished at the same cost.

AMERICAN LOCOMOTIVES are in demand abroad. In the past nine months 126 of them, valued at \$1,000,000, were exported. The enterprise of our manufacturers, the genius of our inventors and the skill of our mechanics command admiration all over this wide world.

The San Jacinto Estate, where the Temescal tin is being produced, comprises 46,000 acres of land in San Bernardino county, and joins Riverside on the south. It contains, in addition to the tin-bearing land, which averages three miles wide by seven miles long, the Gavilan gold mines as well as deposits of silver, nickel, cobalt, copper and iron. There is also gypsum and fire-clay and a valuable water system is being developed, that will irrigate all of their arable land.

SCIENTIFIC PROGRESS.

Segregated Ferments for Wine.

It has long been known to scientists that fermentation, under all conditions, is due to the presence of minute organisms—that it is "the result of processes of life and vegetation in lower organisms, such as fungi and bacteria." This discovery and the methods of turning it to practical use, is due to the investigations of Pasteur. Received at first with many doubts, the matter is now universally acknowledged as a scientific fact.

The field of research in this direction is moreover constantly widening, and the practical advantages which are being derived are quite beyond computation. The microbe theory of diseases and the consequent improved modes of treatment are due to this line of research.

Among the industries, "the practical advantage of ferments is found in the conduct of the modern brewer who, instead of leaving his ferments to chance or uncertainty, makes a careful cultivation of his yeast, thus gaining complete control over his fermentations."

Wine Ferments.

What promises to be one of the most important steps of progress in this direction is its application to the production of bouquets in wines.

Following out certain views on fermentation, says a cotemporary, a French chemist and a Burgundy wine-grower thought that the special bouquets of Bordeaux, Burgundy and other wines were caused by special ferments. Seven years of patient study have proved the soundness of this view, and to-day the special ferments of a long list of wines, such as Bordeaux, Margaux, St. Emilion, Grand Champagne, Cognac, Chablis, Sauterne, Riesling, Pommard, Beaunolais and many others, have been segregated.

In 1889 the experiments were concluded, and special samples of ferments were given to about 300 wine-growers, in Algeria and France, for trial, with the result that for the vintage of 1890 ferments equal to 350,000 gallons of wine were purchased by the wine-growers, while for the vintage of 1891 ferments for 11,000,000 gallons were demanded. This lifts the matter out of the domain of experiment into the region of fact.

It is not pretended that any change can be made on wines already made or fermented; nor is it contended that with grape juice giving a bad wine excellent Bordeaux and Burgundy can be made, but the quality can be much improved and the value increased by the use of the appropriate ferment at a very slight cost.

The ferment must be added to the grapes when they are crushed. The fermentation will be found to be more rapid, complete and even, and all the sugar is fermented out, thus avoiding secondary fermentations, and the production of a mawkish and unpleasant taste. The ameliorating or improving effect will be recognized as soon as fermentation is complete, especially when a given portion is left to ferment in the ordinary manner.

All the different varieties of ferment are capable of being separately cultivated. These ferments are about to be introduced in California. George Payne, an English chemist is expected to arrive in this city in a few days, fully competent and duly authorized to introduce the ferments to our wine-producers in the various wine districts of California. It may be proper to add in this connection that our local exports do not have much faith in this new idea; but judging from what has already been accomplished in other directions, there is much reason to look for most satisfactory results in this.

SCIENCE AND PRACTICAL KNOWLEDGE.—A writer in an exchange classifies all knowledge as comprised in two classes. The first is that effect of mind which is the result of curiosity, that species of human instinct which prompts us to inquire the reason for everything we see, every action which takes place among others, among all living beings, among the elements, and among the celestial bodies. Mankind, being endowed with reason, the next impulse is to apply the knowledge so gained to some useful purpose, to produce some benefit to ourselves. The first of these two classes is called "scientific investigation," the second is called "applied science." For instance, we notice for the first time a light from which smoke arises; we investigate, we perceive heat, and that it produces a disagreeable sensation. These are the first scientific facts; we apply the knowledge so gained by resolving never to touch fire. This is applied science. We have employed curiosity to find out the facts. We now employ caution to guard ourselves against damage, and we determine never to touch fire. All knowledge so gained, is by this process. We may be told a thousand times that fire will burn, but we feel that it is only theory; we want facts, and we obtain them by a course of scientific investigation. We use these facts, and thus gain experience, knowledge, at first scientific, next practical, and these two conditions make up the sum of all knowledge. Science is the foundation, practice the superstructure.—*Ex.*

AN EXPLOSIVE MIXTURE was accidentally discovered recently by Dr. John Grant, who writes to the *Lancet* in regard to it as follows: Having occasion to make a disinfectant fluid to apply to an offensive surface on a body awaiting post-mortem examination, I chanced to

select permanganate of potash. Thinking the solution might dry too quickly and inefficiently deodorize the part, it occurred to me to add glycerine on account of its hygroscopic powers. Putting a draught of the crystals into a three-ounce bottle, I added two ounces of water and one of glycerine, and agitated the mixture. To my great surprise the cork and part of the contents were violently ejected, and the remaining portion developed great heat. Every one is familiar with the danger of mixing glycerine and nitric acid; I have not, however, seen any mention of a combination of it and permanganate of potash. I observed the mixture became brown, losing its purple color like a deoxidized solution of the salt; and as no effervescence took place, it is probable that the glycerine combined with the oxygen liberated by decomposition of the salt, and that, further, it possesses by some affinity of its own the power of producing rapid decomposition of the permanganate. Perhaps some chemist will kindly explain.

ELECTRICITY IN COLOR.—A gentleman put on a pair of woolen stockings over his silk ones on a cold winter day. At night he pulled the stockings off without separating them, and was astonished by the crackling noise and even the sparks of electricity which followed. When he drew the silk stockings out of the woolen ones, the electrical attraction was so manifest that the stockings would incline toward one another when held some distance apart. It happened that the silk stockings were black and the woolen ones of light color, but when he tried the experiment with both stockings of the same color, there was no electrical manifestation. The different manifestations were doubtless due to the difference in the materials with which the colors were compounded.

PHONOGRAPH CYLINDERS.—There are a very few who are aware of the vast number of words which can be placed upon a small phonograph cylinder by the point of the writing instrument employed for such purpose. Such a cylinder is about six inches in length by two in diameter, and yet on the authority of Mr. Edison, the entire novel of "Nicholas Nickleby" could be produced on four cylinders. If this be the fact, why may not books be published in this sort of an edition, to be read off by the machine to the purchaser, or his friends, at convenience?

THE GULF STREAM is a very interesting ocean current and has long been the subject of special study by scientists. It is now being further studied by the U. S. Fish Commission, with Prof. Libbey of Princeton in charge. The first point to be investigated is south of Nantucket, and the principal object of the expedition will be to determine the isothermal lines and the influence of meteorological conditions on these lines, with a view of studying their effects upon the migration of food fishes.

A SUBSTITUTE FOR CELLULOSE.—It is stated by *Invention* that an Austrian chemist, Herr Eokstein, has discovered a substitute for celluloid, which he has named hyaline, that is not inflammable. It is grainless, odorless, transparent, tenacious, and may be drawn into threads, or rolled into films. It is described as composed of colophony, lac, copal, Dammar resin, essential oil of turpentine and gun-cotton.

RUSSIAN SCIENTISTS are about going to Northern Africa to make a study of the methods employed by the natives in resisting the inroads of quack-sands. This inquiry is the result of ineffectual efforts on the part of Russian engineers to counteract the effect of quack-sands in trans-Caspian sections, where thousands of acres of the best arable soil are annually used up.

A BAT'S FLIGHT.—The bat is not generally known as having the power of a very long-continued, rapid flight, but Mr. William Hester of Spring Hill, Pa., has trained this uncanny bird as a carrier pigeon, so that it will fly from his place of business, one mile from his home in 28 seconds.

THE ACADEMY OF SCIENCES of France has admitted a new system of musical notation in which 27 characters replace the 203 symbols now employed to represent the seven notes of the gamut in the seven keys.

POLAR RESEARCH.—It is a mistake to suppose that polar research has cost enormously in human life. Despite all the great disasters, 97 out of every 100 explorers have returned alive.

THE LOWEST SOUND the ordinary ear can detect has been made by 990 vibrations, while the highest tone will consist of 2,228,000 vibrations.

THE ORANGE.—It is said that the orange was originally a berry, and that its evolution has been going on more than a thousand years.

WHEN Herschel studied astronomy, only four double stars were known. Now nearly 7000 of them are distinguishable.

SAN FRANCISCO COINAGE.—During the month of June double eagles to the value of \$1,660,000 and standard dollars worth \$1,000,000 were coined in the San Francisco Mint. The coinage for the fiscal year ending June 30th amounted to \$31,212,292, divided as follows: Double eagles, \$21,650,000; standard dollars, \$9,350,373; dimes, \$211,919.

ELECTRICITY.

THE PROFITS OF ELECTRICAL WORK.—In no other department of scientific or industrial research have explorers derived so much profit as in the electrical line, and no scientific body in the country has so many millionaires as the American Institute of Electrical Engineers. At the top of the list is Alexander Graham Bell, whose profits on the telephone are represented by eight figures. Next comes Edison with a seven-figure fortune. Brush, of electric-light fame, and Elihu Thompson, whose financial future is perhaps brighter than any of the others just now, are more than millionaires. Frank J. Sprague was a junior officer in the United States Navy six years ago. He is now flying in the mansion which was built for the Grants. His company sold out to the Edison Company for \$1,000,000, and half of it went to the inventor. Franklin L. Pope of New York and a score of others have independent fortunes. Most of these men were telegraph operators, and most of them began their experimenting and study without a dollar. So says the *St. Louis Globe-Democrat*.

ELECTRICITY IN THE MANUFACTURE OF PHOSPHORUS.—We have already made allusion to the fact that electricity is now used as an agency in the manufacture of phosphorus. A contemporary says the ordinary method of obtaining phosphorus involves elaborate chemical treatment of the materials from which the finished phosphorus is produced before they can be subjected to the action of heat. In the new process, which is now at work upon a commercial scale at a factory recently erected at Wednesfield, near Wolverhampton, England, the electric current is conveyed to the furnace and melts the various ingredients, the phosphorus being deposited in nearly a pure condition; only very little refining being required. The process is stated to be much cheaper than the ordinary method. This is the first attempt to produce phosphorus by electricity upon a commercial scale. The estimated consumption of phosphorus throughout the world is about 2000 tons per annum.

MODERN PROGRESS.—Prof. Elieha Gray remarks that electrical science has made a greater advance in the last 20 years than in all the 6000 historic years preceding. More is discovered in one day now than in a thousand years of the middle ages. We find all sorts of work for electricity to do. We make it carry our messages, drive our engine, ring our door bell and scare the burglar. We take it as a medicine, light our gas with it, see by it, hear from it, talk with it, and now we are beginning to teach it to write. What will it not yet be doing for us?

TO MODIFY THE ELECTRIC LIGHT.—The brilliancy of the incandescent electric lamp is often a serious objection to its use, and a very simple method of modifying its dazzling glare has been suggested. All that is necessary is to dip the glass in a saturated solution of alum and water, and then apply, when dry, a coat of collodion as a protection. This is said to make the light very soft and agreeable, even to the most sensitive eyes.

CHEAP TELEPHONES.—Residents of Stockholm, Sweden are charged only \$2.75 a year for the use of a telephone instrument, with but 2½ cents for each call. It is to be hoped that the cost of telephone service in this country will soon be reduced to a reasonable figure, so that our people can more generally enjoy the privileges of this now almost indispensable business and social adjunct.

LUMINOSITY OF THE ARC LIGHT.—Prof. Elihu Thompson corrects the popular impression that luminosity of arc lamps is due to heated carbon particles. He says that, although there is a steady stream of carbon vapor between the carbons, yet the light is nearly all derived from the enormously heated surfaces from which the evaporation takes place.

CARBON POINTS FROM NATURAL GAS.—Two chemists are reported to be experimenting at Freeport, Pa., with the object of producing carbon points for electric lighting from natural gas. It is said that by burning the gas in a specially prepared furnace pure carbon is obtained, but as yet at a cost too great for practical purposes.

A NEW MOTOR ARMATURE.—Simply a piece of Norway iron of the best quality, and no wire at all, constitutes the armature of a motor just brought out by Mr. W. S. Richards of Boston—said to be quite efficient.

THE WEATHER BUREAU.—The United States Signal Service closed its labors on the last day of June. General Greely is now the head of a purely military staff corps, while the Weather Bureau is a part of the Department of Agriculture, with Prof. Mark W. Harrington of Ann Arbor in charge. General Greely has been in the signal corps since 1871. He constructed telegraph lines in Texas, Dakota and Montana until the scientific societies nauted in sending expeditions to the north polar region. Lieutenant Greely was put in charge of the American party, and was absent three years. On his return, he was made a captain, and later, when Gen. Hazen died, was made Chief Signal Officer, a position which carried with it a Brigadier-General'ship. He is now Commander of

the Military Signal Corps. Prof. Mark Harrington has been all his life a scientist and naturalist. His is known as a botanist, as an astronomer, as a mathematician, and as the editor of the first meteorological journal issued in this country. Hereafter all those engaged in the Government's meteorological work will be civilians, from the head of the bureau to the novice in the service.

SHOP NOTES.

The Little Shop.

The blacksmith and woodworker in the little village shop looks upon his business as a mere incident to the great shop where hundreds of men are employed. Ambitious to make more of a mark in the world, he not unfrequently sells out his little business and seeks for a better one in a larger town, successful in some instances and unsuccessful in others. It is always a justifiable ambition to improve one's condition, but the man who fills a position, no matter how humble it may be, is entitled to all credit and deserves more than he whose ambition carries him beyond his ability to fill it.

The little shop is more than it appears to be; it not only supplies the surrounding community with the needed conveniences for new work and repairs, but it is more than this; it is the primary school where the boys learn the A, B, C of this business, and through its little doorway pass the mechanics who afterwards make their mark in the larger shops.

Boys learn trades in the larger shops, but we risk nothing in the assertion that a very large percentage of superintendents and foremen are men who began their trades in the little shops, particularly in the blacksmith and woodwork branches.

It may be hard and not particularly agreeable work to labor in the little shop, making repairs and odd pieces of new work, but it is instructive and tends to set a boy to thinking of things that would never receive the least attention in the larger shops; it broadens his mind and encourages study in all departments of his business. A boy may and will learn his trade in a large shop, but unless he is ambitious he will learn one department only. As a blacksmith he may become an expert on road wagons or other vehicles of that kind, but beyond the one kind of carriage, he will learn nothing. So too in the wood shop; the work he begins upon he adheres to, as in both cases there is more money to the journeyman at the time than though studying up other branches.

We say then to the man who has a small shop, don't be ashamed of your business, increase it if you can, but don't drop the apprentice system. It pays to teach a boy the trade, and the trade needs just such a line of mechanics, boys who have been taught the general principles, to enter large shops and complete their education, and furnish competent men to take charge of large establishments. Ninety per cent of men who have become successful manufacturers began their trade in the little country shop.—*Blacksmith and Wheelwright*.

WE CAN NEVER KNOW TOO MUCH.—In a small shop, a machinist is often sized up by his ability to "rig up" for jobs too big for the shop or its tools. The man who "rigs up" the best, usually has the best ideas regarding other things. In other words, he is in the habit of thinking about his work. Everything that can be thought of pertaining to the proper condition of every machine in a shop, or to the proper way to do an odd job, should be carefully studied out. Not only a beginner, but every journeyman in a shop should read up everything he can get and find time to pursue that relates to his business. Every man who desires to make a success in business should make it a constant study to improve himself. He can never know too much.

A HINT FOR A FOREMAN.—One of the good points that should be seen in a foreman is the ability to look ahead and see what is coming and have all the difficulties provided for as fast as they appear. It is something like a man laboring under a heavy-loaded wheelbarrow; you can help him about as much by knocking out the little trigs and obstructions that are likely to come before the wheel, so as to make all smooth work for him, as you can by seizing hold of one arm of the barrow and rushing recklessly over everything by main strength.

A READY WAY TO COOL A HOT JOURNAL IN MACHINERY that cannot be stopped is to hang a short endless belt next to the box, and let the lower part of it run in cold water. The turning of the shaft carries the belt slowly round, bringing fresh cold water continually in contact with the heated shaft, and without spilling or splashing a drop of water.

A SUBSTITUTE FOR EMERY IN GRINDING has been found, it is said, in crushed steel. Highly tempered steel is heated and plunged into water. This renders it so brittle that it can be pulverized, and in this shape it has been found to do the work of emery better than the genuine article.

LINE SHAPING should never be placed along the side of a room so that all the machinery will be belted from one side. Equalize the strain on the shaft by placing the machines on both sides. For this reason the shaft should be run through the center of the room.

USEFUL INFORMATION.

ANCIENT AND MODERN FELTS.—An illustration of the intimacy of the most modern and most ancient of civilizations is found in the fact that it was left for an American citizen to first successfully essay the mechanical fabrication of felted cloths. Thos. Robtson Williams of South Kingston, R. I., invented the process of making felted cloths of commercial length, and patented it May 22, 1830. Since that day felts have appeared in innumerable forms—as plumed and embossed piano cloths, ladies' skirts, floor coverings, often with highly artistic designs, material for roofs and protectors against weather, piano hammers, shoe linings, etc. It is difficult to imagine any department of industry in which wool, in its felted form, does not somewhere play its part. Thus we have taken the simple discovery of antiquity and made it among the chief instrumentalities of civilization. The Tartars and kindred peoples who occupy the middle and northern regions of Asia, and whose manners and customs have remained unchanged from the most remote antiquity, employ the felted wool in a variety of functions, only less important than the supplying foods. Both their clothing and their habitations have consisted of felt since a knowledge of them first went upon record in the fourth century. The process of felting was generally known among ancient nations. The Greeks gave to it the name *piledia* from *pileo*, to compress; literally a compression or thickening of the wool. The ancients employed felt for a great variety of uses, just as we do, the chief being to make coverings for the head, the most common form among the Greeks and Romans being the skull cap.—*Popular Science Monthly*.

A NEW USE FOR WASTE GLASS.—A new use has been found for waste glass by Messrs. Rostaling, Garchey & Gelle, of Paris. Any fragment of broken glass of various colors are mixed together, after having been broken to a suitable size, they are then placed in molds lined with silica, talc, or some other resisting material and fired. A coherent mass is produced which can be dressed and cut into blocks, which are, of course, irregularly colored. Such blocks may be used as artificial marble. The blocks are usually rough on one side, owing perhaps to incomplete fusion; this gives a surface which is admirably adapted for causing them, especially if they are slab-like in form, to adhere to walls with the addition of a little mortar. Fine decorative effects can thus be produced. Designs in relief can be obtained by pressure while the block or slab is still plastic. If a suitable mold be prepared with movable partitions, then pieces of glass can be arranged in such a way that, upon firing, a very effective "stained glass" window is produced, the necessity of using "leading," as in the ordinary way, being thus obviated. This idea will enable many manufacturers, who have heaps of "waste" glass lying about useless, to turn them with very little expenditure to profitable account.

SYRUPS THAT WILL NOT FERMENT.—If 10 per cent of alcohol is added to the water with which the ingredients are to be extracted, the syrups will not ferment. The best proportion of sugar to the liquid is as follows: Syrups made with a more or less alcoholic menstruum, three parts of sugar to every two parts by weight of liquid; syrups made with water alone, five parts of sugar to three parts by weight of liquid; fruit syrups, nine parts of sugar to five parts by weight of liquid.

SILVER IN BELLS.—A writer in an English scientific journal says with regard to the practice of putting silver with the other metal when a bell is to be cast: "I once asked a foreman in a well known bell foundry whether putting silver in a melting pot was of advantage. He replied, of great advantage—to the founder—as the silver sinks to the bottom; the founder pours off the copper and tin, and when the silver has cooled, puts it in his pocket."

GUN BARRELS.—The only proper way to keep a gun barrel in good order is to wash it out with boiling hot water, dry with linen swabs and oil with vasoline or cylinder oil, every time that it is used. It should never be laid aside unattended to for a day or two after firing.

IRON POLISHING.—Small articles made of malleable iron are now finished and polished bright by being placed in revolving drums with curriers shavings, from which they emerge with all of the rough edges smoothed and the surface highly polished.

A REWARD.—A German capitalist has offered a reward of \$25,000 to any astronomer who can satisfactorily prove to him that the sun, the moon, or any one of the stars is inhabited, or that it contains any solid matter whatever.

IT WAS SUCCESSFUL.—A Georgia teacher who could not teach one of her young pupils to remember the letter H, cut one of the letters out and made him swallow it. This had the desired effect.

PUT CAMPHOR GUM with your new silver ware, and it will never tarnish as long as the gum is there. Never wash silver in soap suds, as that gives it a white appearance.

GOOD HEALTH.

The Eyesight of Coal Miners.

Dr. J. Court of Staveley, England has recently made a report upon a series of investigations as to the effect of safety lamps upon the eyesight of men engaged in coal mining. The investigations were carried out in the Derbyshire collieries, a number of men working with safety lamps and a number using naked lights being examined. It was found that out of 524 persons using safety lamps, there were 164 afflicted with nystagmus (which consists of a peculiar oscillation of the eyeballs), 127 had night blindness, and 61 photophobia. This clearly proves, Dr. Court states, that there is a serious amount of disease, and is in striking contrast with the disease found among the 573 miners using naked lights, of whom only 32 had nystagmus, one had photophobia, and 12 night blindness. This difference is made greater still when it is borne in mind that, out of these 32 cases of nystagmus, 29 of the men had previously used safety lamps, and the one man with photophobia and 11 of the cases of night blindness had also been employed in mines worked with safety lamps. In other words, of the 544 men who had always used naked lights, there were only three who had nystagmus, and they worked with candles.

Among the torchlight men, 228 in number, there was not a single case. Dr. Court holds that the insufficient light of the safety lamps is the chief if not the sole cause of nystagmus, night blindness and photophobia. The remedy proposed by him is that a light should be found that would be greater in quantity and with less shadow than there is in the Marsaut and similar lamps. At first he thought the position of the men in working the coal was one of the chief causes of nystagmus, but his inquiries have convinced him that it is the want of a good light that is the only cause of the mischief.

WHISKY AS AN ANESTHETIC.—I have for some years past been advocating the use of whisky as an anesthetic in certain surgical operations," remarked Dr. I. Love of St. Louis to a group of interested auditors in the Arlington rotunda. "I recall to mind a ludicrous incident in this connection that occurred in my practice only a few days since. A negro came into my office and asked me to operate on a felon. 'Fore God, doctor,' he exclaimed, 'don't hurt me; I'm dreadful 'fraid of pain.' 'Joe,' said I, 'I will cost you \$5 to give you chloroform, but I have something that will put you to sleep and you won't feel the operation, and the whole job will only cost you \$1.' I then took a half a pint of whisky and divided it up into three doses, and ordered him to take them with a half hour intervening. Along in the evening I got into my carriage and drove to the negro's cabin and knocked at the door. The only response was loud snoring. I pushed the door open and found that my patient was not only sound asleep, but was alone. I took the hand afflicted with the felon, unwound the rag and proceeded to cut open the thumb. The only sign of consciousness was when the knife struck the bone, when he gave a most tremendous snort and a jerk of the arm. I fixed up the wound nicely and laid the arm on his breast, and on taking hold of the left hand to arrange it also, I found, tightly clutched, a dollar bill. I relaxed the fingers, took out the bill, put it into my vest pocket and withdrew, leaving my patient still snoring as loudly as ever."—*Globe-Democrat*.

POINTS FOR THOSE WITH POOR TEETH.—Abscessed teeth, especially in the back of the mouth, and more especially in the lower jaw, should not be left in the mouth after a reasonable amount of skillful treatment has failed to control the discharge of pus. Chronic abscesses discharging pus, which is swallowed with the saliva, are too frequently allowed to pass unnoticed, and serious derangements may arise from this constant assimilation of a septic poison. If the abscess cannot be cured, extract the tooth. As to when to extract teeth, I have only to say that once it is decided to have the teeth removed, the sooner it is done the better. If it is designed to take gas, the dentist should not be visited immediately after a meal, as the presence of food in the stomach is likely to result in nausea and vomiting, which is unpleasant for both the patient and the operator. Take gas on an empty stomach.—*A Dentist in N. Y. Herald*.

THE PULSE.—A physician who kept a nightly record of his pulse for five years, reports that every year it falls through the spring until about mid-summer, and then rises through the autumn to November or December. Then comes a second fall and a second rise, culminating in February.

HABITUAL DIVERS in salt water often have inflammation of the eyes. The exposure such diving necessitates is not beneficial.

LEAD ORES FROM MEXICO.—The Collector of Customs at El Paso, Texas, in an interview in regard to the charges of fraud made by several Western papers, in the admission of lead ores from Mexico, says fraud is impossible, owing to the system of checks upon importations.

SCIENTIFIC PRESS PATENT AGENCY.

DEWEY & CO., PATENT SOLICITORS.
A. T. DEWEY, W. B. EWER, G. H. STRONG.

SAN FRANCISCO:

Saturday, July 11, 1891.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Hauling Sagebrush, Tuscarora, Nev.; Tulloch's Improved Concentrator; Electric Mining Locomotive, 17. Machinery for Breaking Coal, 29.

EDITORIALS.—Hauling Sagebrush; An Electric Locomotive; The Tulloch Concentrator; California Mining Machinery; Miscellaneous, 17. Passing Events; Stocks on Margins; California Iron; Oregon Gold Mines; The Lake in the Desert; Machinery for Breaking Coal; Miscellaneous, 24.

MECHANICAL PROGRESS.—Recalculation in Steel and Iron; The Micro-structure of Steel; Mechanical Stress of Steel; Special Machinery; Manufacture of Heavy Guns; The Water Gate; Armored Ships Not Altogether New; Steel in Car Construction; Miscellaneous, 22.

SCIENTIFIC PROGRESS.—Segregated Elements for Wine; Science and Practical Knowledge; An Explosive Mixture; Electricity in Color; Phonograph Cylinders; The Gulf Stream; A Substitute for Colluroid; Russian Scientists; A Bat's Flight; The Academy of Sciences; Polar Research; The Lowest Sound; The Orange; San Francisco Coinage; Miscellaneous, 22.

ELECTRICITY.—The Prospects of Electrical Work; Electricity in the Manufacture of Phosphorus; Modern Progress; To Modify the Electric Light; Cheap Telephones; Luminosity of the Arc Light; Carbon Points from Natural Gas; A New Motor Armature; The Weather Bureau, 23.

SHOP NOTES.—The Little Shop; We Can Never Know Too Much; A Hint for a Foreman; A Ready Way; A Substitute for Emery; Line Shafting, 23.

USEFUL INFORMATION.—Ancient and Modern Felts; A New Use for Waste Glass; Syrups That Will Not Ferment; Silver in Bells; Gun Barrels; Iron Polishing; A Reward; It Was Successful; Miscellaneous, 23.

GOOD HEALTH.—The Eyesight of Coal Miners; Whisky as an Anesthetic; Pointers for those with Poor Teeth; The Pulse; Habitual Divers; Lead Ores from Mexico, 23.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 20-21.

MINING STOCK MARKET.—Sales in the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, etc., 28.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 28.

MISCELLANEOUS.—Overloaded Mining Companies; Amador County Marble; Recent Additions to the State Mining Bureau; The Stanford University; Mining Stocks on Margins; Progress of the South; Another Case Settled, 18. The MacArthur-Forrest Process; A Stockton Gas Well, 19.

Passing Events.

The cause of the flood in the Colorado desert proves to have been what was expected—merely a break in the Colorado river, which has been running very high for some time. A heavy body of water is still running into the sink at Salton, and salt mining has been necessarily stopped for the present.

A few days ago the Supreme Court decided that the purchase of mining stock on a margin was illegal, and that a suit instituted to recover any security given for the purchase of stock under such conditions has no standing in court. This is a heavy blow at the Stock Exchange business, especially since a rehearing has been refused.

The drafts of a number of miners from the Idaho mine at Grass Valley would seem to indicate a near close to the long and prosperous career of that famous mine. Still, aside from this, the mining interests of Nevada county are in a more prosperous condition than has been the case since the closing down of the hydraulic mines.

Stocks on Margin.

In another column is printed the main points brought forward by the San Francisco Stock Exchange's lawyers in asking for a rehearing in the now famous suit of Cushman vs. Root, the particulars of which we have heretofore given.

To say that the denial of the Supreme Court for a rehearing was a surprise to stock-brokers is a tame expression, for great confidence had been felt that the court would grant it. The case now goes to the Superior Court for retrial, when able counsel will represent the stock-brokers with the hope of securing a contrary decision to that recently rendered. Whether they will succeed is a disputed question, one on which able lawyers are said to differ; but, so far as we can personally learn from disinterested lawyers that have given the subject attention, it will be hard to have the decision reversed. They one and all are agreed that the Constitution forbids the dealing on margin, but they do not interpret this as meaning that brokers cannot loan money on stocks in a legitimate business manner. By "in a legitimate business manner" they say means when the stock has been actually purchased and a transfer made to the buyer by having the certificate of stock made out in his name. This shows ownership, and no law can prevent any person, desiring, from loaning money against the stock, and if its market value goes down so that a loss is met by the person or broker loaning the money, he can sue for and recover the sum due. But where a purchase of stock is reported and no transfer made, then the person or broker who reports the purchase and carries the stock on a margin has no recourse if, in a declining market, a loss is incurred.

We take it that this is a reasonable and a business view of the case. For in all other business when a purchase is made a transfer of ownership, to make it legal, has to be made, and no written agreement to the contrary unless recorded, will hold, and even then it is doubtful if the latter will hold unless a transfer of ownership is made. In stocks a transfer of ownership is acknowledged when the certificate is made out in the buyer's name, and a record of the same made in the company's book.

The feeling among mining men, those who wish to see the industry placed on a business basis, is that the courts declaring margin trading illegal, will do no little in doing away with the spirit of gambling with which the stock boards appear animated, and bring in a class of buyers who operate largely for investment, yet who are large traders on the market, and it is these that give tone and standing to the business and cause good prices to obtain. Since stock dealing has largely degenerated to more or less of a gambling character, it is with difficulty that prices can be advanced, and even when they are sent to higher ranges of values there is no stability, and they fall at such a break-neck speed as to swamp all who bought and lessen year by year those who deal.

There is another and important view to take of the decision, and that is by making stock-dealing partake more of a legitimate business character. It will unquestionably do away with the listing of the shares of "wild-cat" mines on the two exchanges, for the class of operators who will come into the field when stock-dealing becomes legitimate will operate only in the shares of those mines that have a reasonable prospect of being developed into a dividend-paying proposition. There are too many so-called mines whose shares are now listed that have nothing more than a prospecting hole sunk so as to locate and hold the claim, and the managers of which never entertained any other idea than to sell the stock on a boom in the mining share market. The weeding out of such stock by the two exchanges will do great good to the mining industry and not bring it into so much disrepute as is now the case.

ZINC ORES.—The census gives the following statistics of zinc ores in 1889: Missouri, 93,131 short tons; New Jersey and Pennsylvania, 63,339 short tons; Kansas, \$30,575; Wisconsin, 24,832; Virginia and Tennessee, 12,906; Iowa, 450 short tons.

ROBERT McMURRAY, the well-known mining man, is in Chicago on business connected with the World's Fair.

The onyx beds at Cave Creek, Arizona, are being opened up properly.

California Iron.

Advices from San Diego this week state that the \$290,000 bonds for the establishment of an iron plant has been raised and Dr. C. J. Eames, the promoter of the enterprise, will commence work at once. It is proposed to put up a plant with a capacity of 100 tons per day, to be worked on the direct process.

The iron ore is to be obtained in San Bernardino county. Its quality is unsurpassed; very high in iron and low in phosphorus and sulphur. For fuel, lignite and oil are to be used. There is no good coal in the southern part of the State, but there is plenty of oil. Dr. Eames tells the San Diego Sun that he expects to be able to convert 36,000 tons of bloom per year into merchantable iron at San Diego. There is a vast difference between a blast furnace and the direct process. For the direct process a manufactory can be built in three weeks for \$100,000.

Dr. Eames says: "I know that by erecting a steel addition to the iron plant here we can make 'open hearth' steel, from which can be turned nails, tools, machinery, etc. The 'bloom' will make merchantable iron, and the 'open hearth' steel will make boiler plate, armor plate, axles, sheet iron, etc. A 30-ton furnace for this 'open hearth' steel will cost \$35,000, and three heats of 15 tons at each heat can be turned out every 24 hours. The iron ore here will make magnificent steel, and the merchants will buy the goods and the farmers will buy the tools manufactured on this coast in preference to any other on account of their superior quality."

Oregon Gold Mines.

Mr. Alfred L. Correy of Baker City, Oregon showed us a number of specimens of gold and silver ore from that region this week. Mr. Correy informs us that the outlook for the mining country around Baker City is very bright indeed, and that many mines are being opened. There are 25 quartz mines in full operation near the city, discharging some \$20,000 per month for labor; and in the various other camps of Baker county, prospecting and development work are going on.

Baker City is on the banks of Powder river, in the heart of a rich mining and agricultural region. The Powder River valley is 16 miles wide and 20 miles long, at an elevation of about 3000 feet above sea level. The city is on the main line of the Union Pacific, 357 miles east of Portland.

The Crocker Creek district, where there are some very prominent mines in which large capital has been invested, is a rapidly developing region. Experiments are being made with the McArthur-Forrest process, as the ordinary milling process has not been successful on some of the ores of the larger mines.

The great Seven Devils district, on Snake river, is only 75 miles northeast of Baker City. Sanger, Sparta and Cornucopia, on the north, are all flourishing camps. The Baker City quartz region is now only in its infancy, and although they experienced some difficulty in saving all the gold in the ore, this is expected to be overcome.

THE CON. California and Virginia mine yielded last month, from 10,250 tons of ore, \$279,177.74, of which \$125,112.84 was gold and the balance silver. The average yield in hullion per ton was \$27.23, of which \$12.20 was gold and \$15.02 silver.

THE PRESS CLUB of San Francisco gave a reception on Saturday evening, July 11th, to Mr. and Mrs. O. Black. The committee having the affair in charge is composed of E. W. Townsend, Wm. N. Hart, E. F. Moran, Walter B. Cook and Mark Thall.

PRESIDENT VALENTINE of Molders' Union No. 164, has resigned and gone East to enter on the duties of his salaried position as Vice-President of the International Molders' Union. D. Gunn has been elected President of the local Union.

THE output of lime in California is about 300,000 barrels a year, worth about \$450,000. There are 500 men employed at the kilns and quarries.

OFFICIALS of the U. S. Geological Survey are at work in Plumas county pursuing their investigations on the gold belt of California.

The Lake in the Desert.

The water has continued to rise in the new lake at Salton, Colorado desert, San Diego county, but there is said to be no danger to the railroad track, although the salt works have been temporarily abandoned. One may now go in a boat over the fields where the salt was formerly gathered. It is proved that a heavy current of water is running into the desert from the Colorado river, and the new channel is both wide and deep. Engineers are now out making a survey of the situation. Advices to the Southern Pacific Co. state that the water leaves the Colorado river about eight miles from El Rio, and flows through several channels from four to six feet deep and from 30 to 40 feet wide. It flows westward along the sandhills and on the line of the old stage route through the Alamo Locho station. The channels there join, making a stream about 100 yards wide or more, and having a velocity of four miles an hour, and gaining. It was too deep to get the depth, but the old slough at that point was formerly 20 feet deep. This is about 35 miles from the river.

The source was followed about two miles farther in the direction of Indian Wells. The water all the way was from half a mile to two miles wide, and from two to four feet deep, having a velocity of two miles per hour. The main channel passes Cook's Wells, Seven Wells, Gardner Station, or Butt Station, then on to Alamo Mingo, making a distance of 52 miles from the river. This is the point it enters the desert for Salton. The old stage route, with the exception of five or six miles, is all covered with water. The only way to reach this point is over sandhills and mesa.

This message was received by Superintendent Muir from Richard Quinn, one of the party sent out from Ogihay as a preliminary expedition to make an examination of the country on the south side of Salton basin.

A curious fact in connection with this flood is that the Colorado river is daily falling, yet the volume of water in the sink is on the increase. It seems odd that this filling-up of the desert with water from the Colorado river should occur in this way, when for years men have advocated the assistance of Congress to this end.

The late O. D. Wozenrath of San Bernardino, for many years agitated the subject of turning the river into the desert, and endeavored to get the assistance of capital and of Congress. The idea was to moderate the climate of the surrounding region, and make available lands, then worthless from their aridity and distance from water. Nature has taken the matter in hand herself without the assistance of engineers, and is filling up with water the deeper basin of the desert.

Machinery for Breaking Coal.

In the PRESS of June 27th were given views of the gyrating screens used for sizing coal at the Cross Creek collieries, Pa., as described before the American Institute of Mining Engineers by Eckley B. Cox. On this page are shown the rolls used for breaking the coal. There are two methods of doing this. When the lumps are large and the pieces of slate attached to them are of such a character as to render it economical, the larger lumps are broken by hand, the men using picks made for that purpose, but by far the larger portion of the breaking is done by rolls.

Those used at the Cross Creek collieries differ in one point from those generally adopted. The difference is in the form of the teeth. The rolls used are known as corrugated and the teeth are continuous from one end to the other. There are no points. The end of the tooth is slightly rounded, so as to give greater endurance. The principle upon which these rolls act may be explained as follows:

In the operation of a roll, as ordinarily constructed, i. e., with pointed teeth, the point of one of the teeth inserts itself into a lump of coal, which is passing through the rolls, and breaks it very much as the stroke of a pick would do; that is, the lines of fracture radiate approximately from the point where the tooth strikes the lump of coal. If two pieces of round iron are placed parallel to one another, and at such a distance apart that a piece of coal

6 0 6 12 18 24 30 36 42 48 Inches.
1/2 Inch = 1 foot.

FIG. 1.-ADJUSTABLE CORRUGATED ROLLS.

3 0 3 6 9 12 15 18 21 24 Inches.
1 Inch = 1 foot.

FIG. 2.-FIXED-DISTANCE CORRUGATED ROLLS.

FIG. 4.-SECTIONS OF ROLL TEETH.

3 0 3 6 9 12 15 18 21 24 Inches.
1 Inch = 1 foot.

FIG. 3.-TAPER CORRUGATED ROLLS.

will just be supported by them, and if a third piece of round iron, placed midway between and in a direction parallel to and above the other two, is then brought down upon the coal the piece of coal will break near the middle like a piece of wood subjected to a load in the middle too great for it to bear. The result of this action is generally to break the lump into two pieces of nearly the same size. This is the result sought to be attained with the corrugated rolls, and it is for this reason that the plan referred to below, of breaking from one size as far as possible into the next size below, has been adopted.

One size of rolls is used for breaking lump into steamer, another for breaking steamer

into broken, another for breaking broken into egg, another for breaking egg into stove, a fifth for breaking stove into chestnut, and a sixth for breaking chestnut into pea coal. Experiment has taught that, although all sizes below the size which is being broken are always made, yet the most economical method is to break any size as nearly as possible into the size immediately below it; in other words, that it is more economical to break your lump as far as possible into steamer, then break your steamer as far as possible into broken, your broken into egg, and so on; of course, at each time eliminating all the coal below the size that you wish to break, before passing that size through the rolls. If a piece of any size

is simply broken as nearly as possible in two, for the next size, the amount of small coal made is very much less than if the same piece were struck near the center with a pick and broken into a number of fragments. The old practice, which has not entirely disappeared, was to arrange the rolls in such a manner that by putting them farther apart or closer together, they could increase or decrease the quantity of the larger sizes of coal. But where arrangements are made to break the sizes successively, it is not necessary to change the distance between the centers of the shafts of the rolls after the proper distance for most economical breaking has once been determined.

Fig. 1 is a drawing of the large rolls which is used for the lump and steamer. In these, as will be observed, there is an arrangement for changing the distance between the rolls while they are running (when this change is great, it is necessary to use gear-wheels of greater or smaller diameter), and also a breaking-piece (15) which would be crushed in case a piece of rock or iron should go through the rolls. The bending of the shaft is thus avoided. This disposition of the bed-plates is well known, and has been used for many years. It was originally designed by Mr. David Clark of Hazleton, and is described by Mr. H. M. Chance in volume "AQ," "Second Geological Survey of Pennsylvania." Plate 2 shows the style of bed-plate used for all rolls smaller than steamer-rolls. In this case the pedestals are fixed, and when it has once been determined what is the proper distance between the shafts, no arrangement is made to change their relative position, except by changing the keys which regulate the distance between the pedestals. Plate 3 shows a set of taper-rolls, which are used where a small quantity of a number of different sizes is to be broken up at once. At the upper or larger end the rolls will take steamer; a little farther from the end they will take broken; a little farther, they will take egg; and a little farther, stove. When the coal to be broken is of different sizes, and the quantity not large, these rolls may be economical; but the tendency of practice is to increase the number of rolls, having a different roll for each size to be broken. Plate 4 shows the cross-section of the teeth and a portion of the body of the roll. The largest is the lump-roll, the second is the steamer, the third the broken, the fourth the egg, the fifth the stove, and the sixth the chestnut. Of course it is not usual to break up either stove or chestnut-coal except when it is very flat, and therefore not marketable, or stony. In this case it is broken up into smaller sizes and prepared by jigging, etc.

**JAMES LEFFEL'S Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

BURNHAM, WILLIAMS & CO., Proprietors, Philadelphia, Pa.

**QUARTZ SCREENS**

A specialty. Round, slot or buried slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 146 & 147 Beale St., S. F.

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap on to the end of the fuse firmly and a absolutely water-tight. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, \$2 each, or the entire instrument finished in gold plate, \$5. N. W. MOODBY, Fresno, Cal.

THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading free. It points out one way to 9 Nassau Street, Rockford, Illinois.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safe in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

GOLD MINES

—AND—

STOCK IN MINES FOR SALE.

Dividend-paying Mines from \$150,000 np. Undeveloped Mines from \$10,000 np. Undeveloped Mines on Road. Stock in Dividend-paying Mines from \$1 np. Stock in Undeveloped Mines now being opened from 25 cents np.

All situated in the GRASS VALLEY MINING DISTRICT, the Oldest Quartz Mining District on the Pacific Coast, and the Richest and most Permanent in the World. The mines of this district are practically inexhaustible, as nearly half a century of constant working in pro. f. Grass Valley has the deepest regular dividend-paying gold mines in the world, and the end is not yet, for these same mines are as rich to-day as at any time during their history.

Gold mining, especially in Grass Valley, when under honest and scientific management, is one of the safest and most profitable of all American industries. It is a business that will return annually a profit of from 100 to 300 per cent on the investment. Mining is a science acquired only by years of study, combined with practical experience. Therefore, failure is the rule whenever the management is ignorant and unscientific.

The undersigned is a practical scientific and successful miner, has made mining a life study and vocation, is honest and trustworthy, and will not, under any circumstances, recommend or deal in any but valuable paying property and properties that will develop dividend-payers.

No Wildcat Mines; no Sharp Practice; no reasonable chance for loss; Honesty and Square Dealing Guaranteed. Correspondence solicited.

Full particulars by applying to

S. B. FOWLER, Supt. Hartley Mine, Grass Valley, Nevada Co., California.

THE RUSSELL PROCESS.

For information concerning this process for the reduction of Ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,

Park City, Utah.

MARKET REPORTS.

Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, July 9, 1891.

Although business is quiet, yet the generally expressed opinion is that more active times will be witnessed this fall, than for several years past. At present there is, in some quarters, an undefined feeling of fear, as if something is pending of a disastrous character, no doubt this is generated by the heavy gold shipments (aggregating since January 1st, 1891 over \$70,000,000) from this country to Europe, but this fear ought soon to give way, under an easy growing money market at the East. The disbursements in this month in the cities of Boston, New York and Philadelphia aggregated over \$12,000,000, this is independent of the disbursements in other money centers. All information warrants the assertion that at the East there will be a speculative craze within a few months. This opinion is grounded largely upon the movements of the different railroad managements. The railroads are generally charging more for traffic service, while they are not buying one-quarter of the rails they usually purchase—this means a saving of funds for a big showing. England sold nearly all its American securities and America bought, now we will have to sell and at a good profit. This can be done under big returns from the leading railroad lines.

In this city large sums of money are being disbursed, and although large sums will be required to move the grain crops, yet no friction is looked for.

QUICKSILVER—Receipts the past week aggregate 271 flasks. The market shows more strength in sympathy with an advance at the East.

MEXICAN DOLLARS—The last steamer for China took out slightly over \$100,000. The market is steady at 80¢@81¢. The stock here is not large.

SILVER—Mint purchases so far in this month are as follows:

Date.	Offered ounces.	Purchased ounces.	Price paid per ounce.
July 1.....	944,000	500,000	\$1.0125 to \$1.0225
" 6.....	630,000	1,0135	to 1.0149

The silver market has hung around at about \$1 or per ounce. The offerings on this coast are fair. It is reported that many odd and end parcels are being sold at the East and also on this coast, owing to holders fearing another drop in prices. The surplus in this country is being steadily absorbed, and it now looks as if the Government purchases will soon be confined to the mines current output, and when that takes place, much higher prices are reasonably certain. The stock of silver hulsion in Europe is light, barely enough to meet current trade requirements. The wisdom of our Government in buying 4,500,000 ounces of silver a month, is shown in the recent heavy exports of gold from this country, if we had not added so much money to our circulation, the large exporting of gold would have brought on a big panic.

BORAX—Receipts the past week aggregate 237 cts. The output of the various companies, appear to be controlled, so as to keep the markets within a reasonable range of values.

LIME—Receipts aggregate the past week 2472 bbls. The coast demand is said to be larger than at this time in 1890.

TIN—Imports the past week aggregate 8220 boxes of plate by railroad from the East. Pig is dull and heavy. In plate the market bears every evidence of uncertainty. It now looks as if prices will shade off, at any rate canners and tanners do not care to buy beyond immediate wants. The stock in this country is very heavy.

LEAD—The market has a strong tone, yet business is restricted to actual requirements. The consumption on this coast is said to be larger than at the like time in 1890. The East reports a strong market, with the demand being for actual use and not speculation.

IRON—Imports the past week were 84 tons from Oregon. The market is quiet, but fairly steady. The advance in freights from England, is accepted as a favorable sign. The consumption on this coast is quite free.

COAL—Imports the past week aggregate as follows: Departure Bay 3388 tons, Swansea 2400, Tacoma 2450, Sydney 2491. Total 10,729 tons. The market shows considerable strength. Importers report ships asking more money for freights from both Australia and England, but this is not apt to continue long for the exceptionally large wheat crop on this coast must cause more vessels to head this way, and in coming they will bring coal if to be bad. Outward wheat charters from this port are higher. The labor strikes up north are in a fair way of being settled, or at least, so far controlled as to allow of non-union miners going to work. The spot coal market has a strong tone.

By Telegraph.

New York, July 9.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	101 1/2	101 1/2
Friday.....	101 1/2	101 1/2
Saturday.....	101 1/2	101 1/2
Monday.....	101 1/2	101 1/2
Tuesday.....	101 1/2	101 1/2
Wednesday.....	101 1/2	101 1/2

Quicksilver is strong at a slight advance. Borax is firm. Pig tin is firmer under a fair demand. Iron is barely steady. Copper begins to exhibit more strength.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 30, 1891.

- 455,148.—ELEVATOR SAFETY DEVICE—W. N. Anderson, San Rafael, Cal.
 455,151.—SPRINKLER—A. J. Bartlett, Pomona, Cal.
 455,153.—SMOKE CONSUMER—F. L. Bates, Sacramento, Cal.
 454,993.—RECOIL OPERATED MAGAZINE GUN—R. M. Catlin, Tuscarora, Nev.
 455,169.—SAW BIT—HOLDER—S. H. Chase, San Jose, Cal.
 455,172.—SAWING MACHINE—Coffelt & Vierech Jr., Doe Bay, Wash.
 455,178.—PIPE COUPLING—M. J. Dillenburgh, S. F.
 454,940.—SEPARATOR—J. H. Driller, Los Angeles, Cal.
 455,200.—CASTING MACHINE—J. S. Griffin, Roslyn, Wash.
 455,207.—WIND ENGINE—S. Griswold, Davenport, Wash.
 455,255.—EQUALIZING DEVICE FOR WINDMILLS—E. L. Kenoyer, Hanford, Cal.
 455,004.—HAY RAKE—D. F. Oliver, S. F.
 454,889.—VALVE FOR SINKS, ETC.—A. A. & F. B. Stout, Fowler, Cal.
 455,135.—HOT AIR BRIDGE WALL—E. W. Tucker, S. F.
 455,138.—ELECTRIC SIGNAL FOR STEAM VESSELS, D. D. Wass, S. F.

The following brief list, by telegraph, for July 14 will appear more complete upon receipt of mail advices:

California—Solomon D. Brastow, San Francisco, and J. E. Riel, Newcastle, balance scale; Isaac C. Clever, San Francisco, sectional can for stamp mills; Frank A. Fox, San Francisco, car coupling; Frank A. Fox, San Francisco, assignor to C. E. Bishop, Brooklyn, car coupling; Henry S. Grace, assignor to J. A. Niecher, San Francisco, rock drill; Bernhard E. Henriksen, San Francisco, hoe-bridge; Orange M. Loveridge, Weaverville, derrick; Joseph H. Nethercott, San Francisco, brakehead attachment; Orrin M. Parker, Oakland, double-acting left pump; Clarence M. Symonds, San Francisco, can faucet; William A. Woods, Santa Cruz, assignor to Pacific Gold Savings Company of California, gold saver and concentrator; Joseph H. Yenton, assignor of one-half to J. Campbell, Colorado Beach, crushing mill.

Oregon—Edward G. Good and J. Thorne, Portland, assignors of one-third to E. Rast, Saginaw, Mich., ore separator.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SMOKE-CONSUMER.—Frank L. Bates, Sacramento. No. 455,153. Dated June 30, 1891. This invention relates to that class of devices for effecting in furnaces a more perfect combustion whereby the smoke is consumed, in which a plate extending into the fire-box serves to direct the air downwardly and in intimate contact with the fuel. The invention consists in the novel construction and arrangement of the air-shield whereby its adjustments are effected, and the peculiar plate for controlling the draft. The object is to provide an air-shield mounted in such a manner as to be entirely independent of the door and capable of having a vertical adjustment and a forward and back adjustment. Another object is to provide for regulating the incoming draft by reducing its volume at an advanced stage of combustion, when the greater portion of the smoke may have been consumed.

PIPE-COUPLING.—Michel Dillenburgh, S. F. No. 455,178. Dated June 30, 1891. In a former patent issued to the same inventor Aug. 4, 1885, is shown a coupling in which the two meeting ends of the pipes are enclosed by a sleeve, the end of which enters a recess or seat which is made in the head surrounding the pipe. This recess is made somewhat larger than the pipe and straight for a short distance after which it tapers, passing entirely through the head, and a split ring or sleeve is fitted into this taper portion and is compressed upon the pipe by drawing the head up by means of bolts passing through it and another similar head on the other part of the pipe. In the present invention the coupling heads or sleeves have tapering openings of larger diameter than the pipe made only a portion of the way through them from their adjacent faces and the split clamping rings, made correspondingly conical at one end, fit into these tapering spaces, while the opposite ends abut against packing-rings which are fitted within a sleeve intermediate between the coupling-heads or sleeves. By this construction the inventor is able to make the heads of smaller diameter and less bulky and when the bolts are removed, if it is desired to uncouple the pipes, it is easier to loosen and separate them.

SAW-BIT HOLDER.—Stephen H. Chase, San Jose. No. 455,169. Dated June 30, 1891. This holder is semi-circular in shape, and its front or inner curve forms a continuation of the throat of the saw-plate so as to provide a free escape for the saw-dust. The central portion of the holder is made narrow enough so as to have some elasticity so that the ends of the semi-circular press outwardly, and thus serve to hold the bit firmly in place. By extending the lower end of the bit below the concave front or back and forming the sockets for the extension of the bit and holder they are more firmly locked in the plate, prevented from being displaced by sudden strains, and the saw-plates and parts may be made much thinner.

SAW MILL MACHINERY.—J. A. Robb, 117 and 119 Main St., San Francisco, makes a specialty of manufacturing hand and circular saw-mills, bead hocks, boilers and engines, logging cars and locomotives, Robb's patent lathe mills, gang edgers, etc. He also builds and repairs quartz-mill machinery of all kinds. Mr. Robb is well known and does reliable work.

Mining Share Market.

The stock exchanges adjourned from Wednesday, July 1st, to Tuesday morning, July 7th, and of course, the gudeons made money by not being able to gamble at other persons' money making game. Since the Holidays, the prices or quotations for shares have been marked up slightly with Potosi and Bullion the leaders. The advance in these two stocks, is like all Gen. Hayward's surprises—not heralded by cappers whose chief stock in trade is knowing how to keep broke and eking out a precarious living by giving points to gudeons to beat the pool. Those in position to know the inside workings of the market are not overly sanguine in the market making much of an up move in this month, and think the advance in the middle stocks is a flash in the pan to make a few shorts fill. Time alone will tell whether this opinion is correct, but of one thing, the writer is firmly convinced, and that is, the mines were never in better condition for successful exploiting, and also for taking out ore more cheaply and at less risk of fires, water, caves and other unforeseen events. The long drift on the Ophir 1465-foot level and another on the 1600-foot level which extend through, from Con. Virginia into Sierra Nevada, give good circulation on all levels above and afford the best of facilities for opening out the West or Red lode, which is so rich in gold—and this will be done before the close of 1891.

Among mining men it is now asserted that they have at last been able to locate the Baby that Senator Fair is said to have discovered and its location ever since kept a secret. Senator Fair was superintendent of Con. Virginia when he gave currency to the remark that they had "discovered the Baby, and it was larger and richer than the Daddy." The fight going on over the West Con. Virginia ground has uncovered the Baby and makes it morally certain that the bonanza was found in Con. Virginia's west workings. Evidently those who control the latter mine thought Andes owned the ground. This is confirmed by the recorded agreement between these two mines, but after getting possession of the latter mine, and having surveys made, it is said that the pool is convinced that West Con. Virginia's patented ground takes in the bonanza, and the question now is how to get it without paying for it? In looking over Senator Fair's annual reports when superintendent of Con. Virginia, we were surprised to see that the bullion turned out over 81 per cent of its battery assays. With improved methods of milling the per centage now-a-days should be not less than 85 per cent. Whose fault is it that they are so low?

Stockbrokers appear all "broke up" over the decision of the Supreme Court against carrying stock on a margin. That the decision will stand we do not entertain the shadow of a doubt, and we are firmly convinced it will prove the best for the mining industry, for it will bring it down to legitimate business and not stock gambling as it is now conducted. It will unquestionably have a tendency to bring in a better class of buyers, and it will also make the so-called mine managers enter the market and buy stock for election purposes. This will make the market more active. It is singular brokers do not make a change, for almost any kind is better than the present.

There is no denying but many brokers are very uneasy over the Court's decision on dealing in stocks on a margin, and it may result in their compelling customers to take up their accounts. It is quite certain they will not take any new accounts, as the law or constitution is interpreted by the courts, for they have no protection in the event of prices going down, unless they put the purchased stock in their customers' name, and loan money on the security. This makes it a legitimate business transaction, and in making it so, any loss can be collected at law from the borrower. News from the Comstock mines is of a very important character. Our advices indicate that in one or two of the mines, an ore body is being opened up. This will revive the Comstock mining shares along the entire lode. Before the ore is ready to be shown up, it is equally certain that more assessments will be levied to frighten outside holders into selling.

From the outside mines our advices are of an encouraging character, from the Bodie District, Tuscarora District and also Columbus or Candelaria District.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Cal. & Virginia has bullion on hand amounting to \$86,293.53; also further shipments to arrive on June account.

MINES and Stock in Mines for sale. See advertisement on page 27.

FRANCIS SMITH & CO., Manufacturers of Sheet Iron and Steel PIPE!

ALL SIZES.
130 Beale Street, San Francisco, Cal.
Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

WANTED IMMEDIATELY.

I HAVE INVENTED AN ARTICLE THAT WILL PALE all other similar classes, and I desire some one with money to assist to secure a place on the market. State plainly the amount to be put into the industry, and the interest required in the business. Will cheerfully give all the information necessary. Address JOHN CAMERON, 759 Tupper St., Santa Rosa, California.

Practical Mining Expert.

HAVING ASSOCIATED MYSELF WITH MINING FOR the last 35 years, including three years through five of the principal mining States of old Mexico, I am now prepared to examine and report on formation, together with the permanency, as well as the character of the vein, whether gold, silver, copper, lead or tin. Address JOHN C. COX, Santa Rosa, Sonoma County, Cal.

RICH * BARGAINS

IRRIGATED LANDS

Can be had by applying to E. M. DEWEY, Porterville, Tulare Co., or A. T. DEWEY, 220 Market St., San Francisco,

— VIZ. : —

Five-Acre Villa Lots within one mile of Tulare City limits, at from \$50 to \$80 per acre. Good investment for small or large holders.

Twenty to 160-acre Lots in N. E. quarter of section 8, township 21, range 24, seven miles S. W. of Tulare City. Fenced and every acre cultivated; adjoining a young and nicely growing orchard and vineyard.

Twenty to 80-acre Lots in N. W. Quarter of section 8, adjoining the above; all fenced, ditched and cultivated; \$25 per acre. The quarter (160 acres) will be sold as a whole, with a splendid flowing artesian well, large reservoirs, 7 acres of 8-year-old orchard; 20 acres of alfalfa, and 7-room, 2-story, hard finished house, in good order, costing, with barn and the other improvements mentioned, over \$5000; will be sold at \$40 per acre. The house, front yard and reservoir are environed with beautiful shade trees and shrubbery.

N. E. Quarter of section 7, adjoining, in 20-acre lots, all rich and well cultivated; in 20-acre lots, \$30 per acre; as a whole, \$27.50 per acre.

Plentiful ditch irrigation is to be had for every acre of this land at very reasonable rates. All except the first quarter mentioned is near the center line of the celebrated Tulare artesian belt of flowing wells.

The N. E. one-quarter and south one-half of Sec. 15, T. 23, R. 24, three miles S. W. of Pixlev, Tulare Co., in 40-acre lots, \$20 per acre; 160 acres or more, \$18 per acre; entire, \$16 per acre. Also in Artesian Belt.

The above valuable but extremely low-priced lands will be sold on small cash payments and long-term credit or installments at 8 per cent interest, if bargained for soon.

Visitors to the premises will do well to notify the above-named owners a little in advance. They invite close examination and cash offers. These terms will probably prevail for a short time only.

MINING —AND— Ore Dressing Machinery.

By C. G. WAMFORD LOOK.

CONTENTS.—Motive Power—Transmission of Power. Crushing—Prospecting, Shaft-sinking, Coal-cutting, Pumping, and Ventilating Machinery—Lighting—Hauling and Hoisting Transport—Reducing—Dressing—Miscellaneous.

Prices \$21.00. Circulars and Catalogues on application. E. & F. N. SPON, Publishers, 12 Cortlandt St., New York.

G. H. EVANS & CO.

(Successors to THOMSON & EVANS, 110 and 112 Beale Street, S. F.)

MACHINE WORKS,
Steam Pumps, Steam Engines
and all kinds of MACHINERY.

Declaration of Levy Brown on Spiritualism.

SPANISH CAMP, June 16, 1891.
Mr. Brown came to my place in 1887 and brought with him two men who desired to examine two quartz ledges, which they wished to prospect and, if satisfactory, to purchase the same. One of them liked the ledge on the east side of Big Canyon and was anxious to buy, but said his money was East. He wrote for the money, but failed to get it until his bond expired. After they left I felt fatigued, and laid down to rest and fell asleep. Woke up soon. When I got on my feet I heard the noise of a quartz mill. The stamps struck one, two, three. After that there was a general roar from the stamps. Ran one or two minutes and then struck three, two, one. In about two minutes I heard three distinct whistles from an engine. I wish to sell this ledge and all the land east of the canyon, about 15 or 18 acres. I also wish to sell my ranch west of canyon containing about 140 acres, about 9000 bearing vines and 50 fruit trees of different varieties; also berries of different kinds. House, out-building, with cellar well filled with wine, with all implements necessary to care for the vine. Terms, half cash, the balance on time, with seven per cent interest per annum.

His Mark.
Subscribed and sworn to before me this 16th day of June, 1891. JOHN McCARTY, Notary Public.

ATTENTION.

NOTICE IS HEREBY GIVEN THAT ANY PARTIES infringing patents granted me by the United States on Air Compressors and Rock Drills, by manufacturing, using or selling the same, will be prosecuted to the full extent of the law.

CHAS. CUMMINGS, 411 Mission St., San Francisco.

BLOWING ENGINE FOR SALE.

Vertical pattern, with balanced steam slide valve gear, steam cylinder 14 in. diameter, air cylinder 40 in. diameter, stroke 24 in. 1 to 100 strokes per minute; engine new. For price and particulars address JAMES LEFFEL & CO., Springfield, Ohio.

Send for Catalogue.

PARKE & LACY CO., San Francisco, Cal., AGENTS

ELECTRIC BLASTING.

VICTOR ELECTRIC PLATINUM FUSES. Superior to all others for exploding any make of dynamite or blasting powder. Each fuse folded separately and packed in neat paper boxes of 50 each. All tested and warranted. Single and double strength, with any length of wire.
VICTOR BLASTING MACHINE.—Made in two sizes. No 2 fires 20 to 30 holes. No 1 fires 5 to 8 holes. Adapted for prospecting, stump blasting, quarry and general railroad work.
"PULL UP" BLASTING MACHINE.—The strongest and most powerful machine ever made for Electric Blasting. No 4 size fires 70 holes. No 3 size fires 40 holes. Are especially adapted for submarine blasting and large mining work.
Standard Electric Fuse and Blast Tester. Wire Reels, new design, Leading and Connecting Wire.

MANUFACTURED ONLY BY JAMES MACBETH & COMPANY, 125 Maiden Lane, New York City.

Adamantine Shoes and Dies

—AND—
CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

The red cord runs the entire length. Put up in boxes of 20 feet, or coils of 60 to 80 lbs. For sale by all
dealers W. T. Y. SCHENCK. Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

DEWEY & CO., { 220 MARKET ST., S. F. } PATENT AGENTS.
Elevator, 12 Front.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have
our new Concentrating Belt manufactured in
San Francisco; we can therefore fill all orders
on short notice. The length and width of these
belts are the same as is used on the Frue or
Triumph Concentrating Machines, but can be made of any
length or width desired. The advantages of these belts
over any others will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute
angle inclining toward the center, and therefore readily
conform to the change of direction while passing over
the end rollers; thus the vexation and loss caused by the
frequent breaking of the flanges of the old style belt is
practically done away with. Again, our belts, at intervals
of four feet, have a very slight rifled surface for the
space of three inches, which tends to equalize the pulp
on the belt, and prevents it from banking on the sides and
forming channels through the center. These slight rifles
also save very fine sulphurets and the quicksilver that
would otherwise escape with the tailings from a belt,
the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.

Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Grass Valley, Nevada Co., Cal., Nov. 10, 1886.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

(Signed) DAVID McKAY, Jr.,
Supt North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.
 121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS, Varying from the fraction of 1 up to 15 and 20-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY, UNEQUALED IN EFFICIENCY, UPWARD OF 3000 NOW IN USE.

Will do more than twice the work of any other with the same cost in wear.

Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

THE PELTON WATER WHEEL CO., 121-123 Main Street, San Francisco, General Western Agents.

The Marsh Steam Pump.

In the Marsh steam pump, now being introduced on this coast by the Riedon Iron Works of this city, the most important and usually complex part—the steam valve—has been simplified to one part without auxiliary appendages, accomplishing, however, what other valves of multiple parts do and possessing the function of regulation to a remarkable extent. All the working parts of the pump are so perfectly enclosed that only a small part of the piston rod is exposed to view. This steam pump is designed to fill a noticeable want of engine-builders and steam users for a reliable, economical and efficient boiler feeder. In the Marsh steam pump is offered the advantages possessed by the injector and usual type of pumps combined, with some additional advantages not possessed by either. It is neat and compact in form and ornamental to an engine. It can be set to supply any amount within its capacity. The number of strokes per minute is not materially varied by the rise and fall of steam pressure, and the pump is not injured by rapid reciprocations when the water supply gives out, as the valve mechanism is within itself an automatic governor. In point of economy it cannot be excelled by any boiler feeder, as it returns to the boiler all the steam it uses.

The advantage of an independent and self-contained steam pump over the usual type of attached or cross-head pumps, consists principally in its ability to supply water when the motive-power is at rest, and the facilities which it affords the operator to nicely grade the requisite amount of feed-water regardless of the motion of the engine. Heater pipes and cross-head pumps are inseparable companions, and although the heater is regarded by builders as a nuisance, the use of attached pumps requires their employment. This new pump, however, enables the engine builder to dispense with the heater, as it warms its own water, but does not heat it enough to precipitate foreign substances. An exhaust deflecting valve is used to deflect the exhaust steam

either into the atmosphere or into the suction chamber. When deflected into the suction chamber it is condensed by the cold water and mingles with and warms it, and is then pumped into the boiler.

The sectional view of the pump shows the steam valve in position, the steam and water pistons, manner of packing, etc. The steam valve is made of brass, and though nicely fitted, moves freely in the central bore of the steam

chest. It has no mechanical connections with other moving parts of the pump, but is actuated to admit, cut off and release the steam by live steam currents which alternate with the reciprocations of the steam piston. Each end of the valve is made to fit the enlarged bore of the steam chest, and it is due to these enlarged valve heads, which present differential areas to the action of steam, and the perfect freedom of the valve to move without hindrance from other mechanical arrangements or parts, that the flow of steam into the pump is automatically regulated. The importance of this feature cannot be overestimated, as the pump is automatically regulated, and can never run too fast to take suction, or should the water supply give out when the throttle valve is wide open, no injury can occur to the moving parts. The steam valve does not require setting. It

has no dead center, and will always start when the steam is admitted. The steam piston, as shown, is double, and each head is provided with a metal packing ring, the interior space constituting a reservoir for live steam pressure, supplied by the live-steam pipe through a drilled hole, shown by dotted lines. At each end of the steam cylinder are similar holes leading to each end of steam chest, which, together with the centrally drilled hole, and the space between the piston heads, constitute positive means for tripping or reversing the valve with live steam.

THE break in the Colorado river, which lets the water into the Colorado desert forming a lake at Salton, is said to be a mile wide, and the water is probably 12 feet deep where it flows out.

DOUBLE CYLINDER REVERSIBLE LINK MOTION HOISTING ENGINE.—See page 40.

THE MARSH STEAM PUMP.

STEAM VALVE, PISTONS, STUFFING-BOXES AND STEAM PARTS OF MARSH PUMP.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

New Discoveries in Montana.

Glendale.

EDITORS PRESS:—We learn occasionally of some new prospect that promises to eclipse anything heretofore known. The latest, and one that is creating considerable excitement, is on Red mountain, on the head of Camp creek, Silver Bow county, 12 miles from Melrose and about 15 miles southerly from Batte. The discoverers, John Ogren, an old prospector and resident of Glendale, and Joseph Durrer of Heola, made the first location in the latter part of May last, named the American Mint. Since then they have made three locations on the extension of the ledge. The Morning Star on the north and the Mountain Lion and Mountain Sheep on the south. From Ogren we learn that the American Mint is over 200 feet wide, several holes having been sunk in the solid formation, and only one wall discovered. It is his opinion that the whole vein-matter will run from 20 to 50 ounces silver, but several assays have exceeded 100 ounces, and one event 364 ounces silver. Old prospectors state that they have run over the ledge dozens of times, but the vein-matter being so much different in appearance from anything they were acquainted with, they did not consider it worth assaying.

Now, however, there is quite a stampede to the locality, and Mr. Reynolds, superintendent of the Anaconda Co.'s mines on Camp creek, having learned of the wonderful discovery, and looked over the ground, put several men to work prospecting in the vicinity next morning after his first observations. It is reported that he has discovered a fine-looking ledge.

Messrs. Hutchins & Sirla of this place have located a four-foot ledge joining and parallel to the American Mint, the ore of which is similar in character. Many more locations have been made, of which we have no definite information.

Ogren & Durrer have now got men at work making a road to the claim, and will commence shipping ore as soon as possible. It is said to be the milling rock, and the owners have located a mill-site and water right within a few hundred yards of the ledge; but, being poor men, they will be obliged to ship their ore until means are acquired to put up works of their own.

Making due allowance for excitement, the opinion prevails here that the boys have a good thing, and the stir created by this strike will doubtless result in many valuable new discoveries.

Melrose will be benefited more than any other town by a boom on Camp creek, and should do all that is reasonable to encourage prospecting in that locality. It is one of the most beautifully situated towns in Montana, at the mouth of the Big Hole canyon, on the U. & N. R. R., where Moose creek and Camp creek waters could be utilized for milling or smelting purposes to good advantage.

From Vipond district, near Glendale, we learn that the new mill of 15-stamp capacity is now completed and will start up for its first run on Gray Jocky ore. The new shaft on that mine is now down 40 feet, all in ore, and immense bodies are stripped on the surface, with about 100 tons on the dump—in fact everything about the place looks encouraging, and the company are to be congratulated on the result of their labors. H. W. B.

THE ALTA TANKS.—The Alta tanks were started yesterday to help drain the Gold Hill mine. Their capacity is 700 gallons each—two of them working on counter balance. Record was kept of their work for the first two hours of starting. They raised 216 tanks in two hours, being at the rate of 1,800,000 gallons in 24 hours, or nearly double what has been undertaken to be done. While this was done with men who didn't have the complete "hang" and "run" of things, better results are not looked for—everything being absolutely satisfactory. The Gold Hill Pumping Association is to be thanked. It has been owed by nothing. It has been met with formidable obstacles everywhere every hour of its existence. Undismayed it has done its best. The men composing the association have gone down in their pockets every month. They have called into requisition every resource in their power; they do not give up; they persist. The developing and working of ore bodies below the water level will be entirely due to them. They should ever be remembered as pioneers in the good work, and benefactors of the community.—*Virginia Enterprise.*

PIERCE WINS HIS SUIT.—James P. Pierce has won the suit instituted against him by the Excelsior Water and Mining Company. Pierce was a director in the company, and during his term of office, the corporation paid 18 dividends, aggregating \$266,000. The company sued Pierce for the amount, claiming that the dividends, declared with the concurrence of Pierce, were not paid out of the surplus profits of the business, and were by the laws of the State illegal. Pierce won his suit in the lower court, and the company appealed. Last week the Supreme Court gave judgment against the corporation.

Local Industries.

Statistics of Mechanics and Manufactures.

Assessor Siebe has filed a statistical report of the mechanical and manufacturing industries of San Francisco, which, from a commercial standpoint, is quite important.

It shows the total number of hands employed, to be 39,765, and the value of all products \$104,745,650. This is a marked increase over the figures shown by the census of 1880, which placed the total number of hands employed at 28,442, and the value of the products at \$77,824,299. The increase in hands employed is 11,323, and in the value of products \$26,921,351. The figures in detail given by the assessor, are as follows:

Agricultural implement manufactories, 4; men employed, 100; value of manufactures, \$175,000.

Artificial stone manufactories, 21; men employed, 250; value of manufactures, \$1,000,000. Axle grease manufactories, 5; men and boys employed, 40; resin consumed annually, 2900 barrels; fat consumed annually, 52,000 pounds; chemicals consumed annually, 60,000 pounds; value of manufactures, \$90,000.

Bag manufactories, 4; men and boys employed, 160; bags manufactured annually, 12,700,000; value of manufactures, \$535,000.

Barrel manufactories, 24; men and boys employed, 575; barrels, half-barrels and kegs made annually, 1,360,000; horse-power of engines, 100; barrels made for sugar refineres, 650,000; syrup kegs made by tub and pall factories, 65,000; value of manufactures, \$1,150,000.

Bed-spring manufactories, 1; men and boys employed, 35; copper wire used, 450 tons; value of manufactures, —.

Bedding and upholstering factories, 18; men and boys employed, 300; value of manufactures, \$800,000.

Bellows manufactories, 3; men and boys employed, 8; bellows manufactured, 210; value of manufactures, \$9000.

Belting manufactories, 5; men employed, 80; value of manufactures, \$250,000.

Billiard table manufactories, 4; men and boys employed, 80; billiard tables made annually, 525; value of manufactures, \$60,000.

Boots, shoes and slipper manufactories, 162; men, women and boys employed, whites, 1400, Chinese, 900; value of manufactures, \$4,510,000.

Box manufactories (oiger), 4; men, women and boys employed, 350; number of boxes made annually, 2,220,000; value of manufactures, \$265,000.

Box manufactories (paper), 7; men, women and boys employed, 130; value of manufactures, \$140,000.

Box manufactories (wooden), 8; men, women and boys employed, 430; horse power of engines, 700; lumber used annually, 3,200,000 feet; value of manufactures, \$1,015,000.

Brass foundries, 7; men and boys employed, 280; value of manufactures, \$445,000.

Breweries, 21; men employed, 550; hops consumed, 1,150,000 pounds; barley consumed, 60,000 tons; beer manufactured, 660,156 barrels; value of manufactures, \$3,995,000.

Broom manufactories, 12; men and boys employed, 180; value of manufactures, \$250,000.

Brush manufactories, 12; men and boys employed, 125; value of manufactures, \$110,000.

Candle manufactories, 4; men and boys employed, 140; candles manufactured, 130,000 boxes; value of manufactures, \$250,000.

Cer manufactory, 1; men employed, 95; oars built, 137; value, \$140,000.

Carriage and locomotive car spring factory, 1; men and boys employed, 11; springs made, 120 tons; value, \$30,000.

Carriage and wagon manufactories, 50; men and boys employed, 500; carriages and wagons made, 1950; value, \$1,000,000.

Chemical works, 7; men and boys employed, 40; nitrates of soda consumed, 360 tons; sulphur consumed, 1350 tons; nitric acid produced 260 pounds; value of manufactures, \$175,000.

Cigar manufactories, 348; men, women and boys employed, 670, Chinese, 3000; cigars manufactured, 110,804,940; cigarettes, 40,840,860; tobacco manufactured into cigars and cigarettes, 2,350,000 pounds; value, \$3,700,000.

Clothing manufactories, —; men, women and boys employed, 2800; value of manufactures, \$6,500,000.

Coffee, spice and yeast powder factories, 11; men and boys employed, 146; coffee ground and roasted, 8,450,000 pounds; chocolate made, 500,000 pounds; spices and yeast powder made, 1,200,000 pounds; value of manufactures, \$2,000,000.

Coffin manufactories, 2; men and boys employed, 35; value of manufactures, \$110,000.

Coppersmiths, 6; men employed, 25; value of manufactures, \$100,000.

Cordage and rope factory, 1; men and boys employed, 220; hemp rope manufactured, 3700 tons; horse power of engines, 260; value of manufactures, \$675,000.

Cracker manufactories, 3; men and boys employed, 275; horse power of engines, 100; value of manufactures, \$1,100,000.

Cream tartar works, 1; men employed, 55; cream tartar made, 400 tons; value, \$115,000.

Cutlery manufactories, 10; men employed, 85; value of product, \$100,000.

Dry docks, floating, 2; men employed, 50; capacity—first, 4400 tons; second, 2000 tons—6400.

Dry docks, stone, 1; length of excavation, 490 feet; width on top, 120 feet; width on entrance, 90 feet; depth, 30 feet; capacity of length, 425 feet; capacity of drawing, 22 feet; capacity of pumps for cleaning per hour, 325; 368 cubic feet; tubular boilers of four-inch tubes, 4; dimension each tube, inches in diameter, 25; fire surface, 38,000 square feet; men employed, 10; cost of work, \$675,000.

Electric machinery works, 16; men employed, 140; value of manufactures, \$150,000.

Elevator manufactories, 7; men employed, 60; elevators made, 80; value, \$100,000.

Flour and feed mills, 15; men and boys employed, 275; flour made, 250,000 barrels; hominy made, 300 tons; buckwheat end rye flour, 600 tons; oatmeal and groats, 2800 tons; cornmeal and farine, 1500 tons; feed barley, 24,000 tons; cracked wheat, 750 tons; split peas, 250 tons; graham flour, 5500 barrels; cracked corn, 2000 tons; ground feed, 9000 tons; pearl barley, 300 tons; value, \$3,500,000.

Foundries, machine shops, boiler and iron works, 43; men and boys employed, 4500; pig iron consumed, 14,000 tons; bar iron consumed, 33,000 tons; rivets consumed, 2500 tons; horse power of engines, 3000; value of product, \$6,000,000.

Fridge factories, 8; men and women employed, 200; value of manufactures, \$450,000.

Fruit-preserving factories, 6; men and boys employed, 800; fruit and meats put up, 4,960,000 dozen cans; value of manufactures, \$2,980,000.

Fur manufactories, 6; men and women employed, 200; value of manufactures, \$350,000.

Furniture manufactories, 21; men and boys employed, 959; lumber used annually, 9,400,000 feet; value of manufactures, \$1,530,000.

Fire works, 1; men and boys employed, 15; value of manufacture, \$40,000.

Gas works, 2; men employed, 620; value of manufactures, \$12,000,000.

Glass staining, cutting and bending works, 3; men and boys employed, 80; value of product, \$915,000.

Glass works, 2; men and boys employed, 170; furnaces, 2; pots, 9; value of manufactures, \$370,000.

Glove manufactories, 18; men and boys employed, 550; value of manufactures, \$900,000.

Glue manufactories, 3; men and boys employed, 25; glue made annually, 475 tons; neatfoot oil made annually, 24,000 gallons; value of manufactures, \$50,000.

Glycerine manufactories, 1; men employed, 15; horse power of engine, 60; crude material used, 100,000 pounds; value of glycerine refined, \$115,000.

Gutta-percha and rubber factories, 2; men employed, 12; sets of machinery, 2; value of manufactures, \$25,000.

Hat and cap manufactories, 10; men and women employed, 185; value of manufactures, \$55,000.

Harness manufactories, 52; men and women employed, 600; value of manufactures, \$1,275,000.

Ice manufactories, 3; men employed, 30; tons made annually, 4800; value of manufactures, \$25,000; capital invested, \$40,000.

Ink and mucilage factory, 1; men employed, 16; value of product, \$37,000.

Japanning and galvanizing factories, 4; men and boys employed, 30; value of manufactures, \$210,000.

Jewelry manufactories, 14; men employed, 135; value of manufactures, \$940,000.

Laundries (white), 44; men, women and boys employed, 1500.

Laundries (Chinese), 284; employees, 1704.

Last manufactories, 2; men employed, 22; lasts made annually, 22,000; value of product, \$22,000.

Lead pipe and shot factory, 1; men employed, 60; lead pipe and shot made annually, 3000 tons; horse power of engines, 100; value of product, \$375,000.

Lined oil works, 2; men employed 62; oil cake made annually, 4550 tons; product of works, 1,250,000 gallons; value of oil, \$800,000; value of cake, \$95,000.

Macaroni and vermicelli factories, 9; men and boys employed, 75; macaroni and paste made annually, 155,000 boxes; flour used annually, 9000 barrels; value of product, \$130,000.

Malthouses, 5; men employed, 80; grain malted annually, 27,500 tons; value of manufacture, \$1,650,000.

Marble works, 33; men employed, 150; value of product, \$300,000.

Match factories, 4; men and boys employed, 145; matches made annually, 2,500,000 packages; value of manufacture, \$64,000.

Mirror manufactories, 3; men employed, 44; number of square feet made annually, 100,000; value of product, \$200,000.

Musical instrument manufactories, 19; men and boys employed, 105; number of pianos and organs made annually, 565; value of manufactures, \$163,950.

Nutmeg manufactories, 1; men employed, 5; boxes made annually, 9,500; value of product, \$38,000.

Oilcloth manufactories, 1; men and boys employed, 22; value of product, \$20,500.

Onyx manufactories, 1; men employed, 5; value of manufactures, \$12,200.

Potteries, 2; men employed, 35; value of manufactures, \$140,000.

Provision packing factories, 5; men employed, 240; beef packed, 8000 barrels; pork, 5500 barrels; ham and bacon, 1,100,000 pounds; lard, 1,200,000 pounds; tallow, 2,250,000 pounds; value of product, \$1,100,000.

Rolling mills, 1; men employed, 900; horse power of engines, 1500; scrap iron used, 24,705 tons; coal consumed, 26,015 tons; value of product, \$1,400,000.

Rubber stamp manufactories, 11; men employed, 60; value of product, \$64,000.

Safe and vault works, 3; bar and iron plate used, 45 tons; steel used, 75 tons; value of manufactures, \$152,000; employees, 26.

Saw manufactories, 3; men employed, 100; horse power of engines, 50; steel used, 500 tons; value of manufactures, \$140,000.

Shirt manufactories, 35; men and women employed, 2100; value of manufactures, \$750,000.

Shipyards, 6; men and boys employed, 650; number of steamers, barges and other vessels built, 33; tonnage, 21,000; value of craft built, \$3,575,000.

Silverware manufactories, 6; men employed, 75; value of manufactures, \$620,000.

Soap factories, 29; men employed, 150; soap made, 12,000,000 pounds; value, \$2,600,000.

Salt works, 5; men employed, 55; run of stones, 9; number of tons, 24,000; value, \$175,000.

Sash, door, blind and finishing factories, 12; men and boys employed, 1450; horse power of engines, 900; lumber consumed, 12,500,000 feet; value, \$5,000,000.

Soda water works, 16; men employed, 140; value of manufactures, \$135,000.

Solder and habit works, 3; men employed, 30; value of manufactures, \$115,000.

Sugar refineries, 2; men employed, 1000; sugar, raw, used, 240,000,000 pounds; sugar, white, made, 134,000,000 pounds; sugar, yellow, made, 72,000,000 pounds; syrup made, 260,000 gallons; value, \$12,250,000.

Tanneries, 43; men employed, 850; horse-power of engines, 1600; bark used, 18,000 cords; hides of all kinds used, 1,750,000; value of manufactures, \$2,750,000.

Tanneries and wool pulling, 4; men employed, 180; horse power of engines, 200; bark used, 500 cords; sheepskins used, 460,000; goat-skins used, 25,000; oilskins used, 30,000; wool produced, 610,000 pounds; value of raw material, \$230,000; value of manufactures, \$445,000.

Tinware, tin box and can factories, 7; men and boys employed, 2100; value of manufactures, \$4,540,000.

Trunk and valise manufactories, 5; men employed, 200; value of product, \$255,000.

Type foundries, 1; men employed, 135; value of manufactures, \$46,000.

Vinegar and pickle factories, 6; men employed, 150; vinegar made, 970,000 gallons; pickles preserved, 120,000 gallons; value, \$200,000.

White lead manufactory, 1; men employed, 60; number of tons made, 3400; value, \$265,000.

Windmill manufactories, 4; men employed, 65; number of mills and oaks made, 1200; value, \$75,000.

Wire and wire rope manufactory, 1; men employed, 250; horse power of engines, 535; wire consumed annually, 17,000; value of manufactures, \$930,000.

Wool scouring and grading mills, 5; men employed, 125; wool scoured, 12,000,000 pounds; value of product, \$2,750,000.

Woolen mills, 1; men employed, 240; number of power looms, 36; cards, 8 sets; spindle, 8000; blankets made, 11,700 pairs; wool used, clean, 375,000 pounds; cloth, tweed and flannel, made, 31,000 yards; value, \$362,000.

Sea and Railway Travel.

In long-distance travel, the sea "still has the edge," notwithstanding the greatly increasing railroad mileage of the world. A friend of ours, Mr. C. H. New of New York, recently completed his second voyage around the world, and during his stay in San Francisco, where he was detained by illness, he told us of the miles he had traveled between 1880 and 1891. On his first voyage in 1880, he was gone eight months, spending some time in the East Indies. In his second voyage, recently completed, he was gone 115 days, starting January 10th. He also spent three months in South America and the West Indies a few years ago. In these trips, he traveled a total of 102,250 miles, of which 11,050 were by rail and 91,200 miles by sea. On the last voyage he visited England, France, Switzerland, Italy, Sicily, Egypt, Arabia, India, Ceylon, Australia, New Zealand, Tonga Islands, Samoan Islands and Sandwich Islands, landing in his native country in California. From here he went through Nevada, Utah, Colorado, Nebraska, Iowa, Illinois, Indiana and Pennsylvania to New York.

During all these thousands of miles of travel only one accident of note was met with, and that was shipwreck near Melbourne.

One could scarcely suppose, unless attention was called to it, that a large proportion of the travel around the world would be by sea. In these days of high speed and fine steamers, with every comfort and appliance, sea travel has lost its unpleasant features. Schedule time is closely carried out by the sea steamers between all the principal ports of the world.

MONTGOMERY.—M. T. Plamenaz of Candalaria, tells in the *Chloride Belt* that he believes a flourishing city will soon grow up at Montgomery, Nev. Montgomery, the discoverer, is employing 35 men, at \$4 wages. A 20-stamp quartz mill is to be put up this fall.

The Great Douglas Spruce.

Chief of trees in point of numbers, and one of the largest composing the great forest development of the Northwest, is the Douglas Spruce, (*pseudotsuga taxifolia*—Sargent).

It is almost everywhere a component of this great forest in all its vast extent, from the shores of the Pacific to the slopes of the Rocky Mountains, and from British Columbia to central Mexico. The headquarters of this development—generated by the warm Japan current—is an elongated, moist region bordering the Puget sound and extending southwest to Cape Mendocino.

In the larger part of this belt the Douglas Spruce forms almost exclusive bodies of dense forest, the tall, straight, self-trimmed trees making depths of excessive seclusion and gloom.

Accessible only from the ocean through the few arms of Puget sound, with the Columbia and half a dozen other navigable rivers south of it, the Douglas Spruce was the first lumber tree to be reached and utilized—and so great has been the consumption, and so inexhaustible the supply, that no lumber is more familiar to dealers than this found in our markets under the names of "Oregon Pine," "Yellow Fir," "Red Fir," "Douglas Spruce," etc., the last being the only appropriate name.

When standing alone or on the edge of a forest it becomes a beautiful, symmetrical cone of verdure, the lower limbs sweeping the ground and all of them in the season, bearing their small, feathered cones pendant from the ends of the branchlets, on all sides—in the manner of all the rest of the spruce trees—but in the dense forest it trims itself and becomes tall, straight and slender.

The bark of the Douglas Spruce is variable, usually dark and very thick, often light colored and only a few inches thick.

The wood is also variable. Two principal kinds are distinguishable, designated by the prevailing color: one being yellowish and close grained, the other reddish and coarser grained.

Experienced lumbermen say they can distinguish the "Yellow Douglas" from the "Red" by the general appearance of the standing trees, but others declare that only the ax and saw will reveal these characters. The latter fact suggests that the phenomena is one of conditions rather than inheritance.

The Douglas spruce is used for a great variety of purposes and in vast quantities. For spars and ship timber, it has scarcely a superior anywhere. Square sticks 80 to 100 feet long may be seen any day, passing on rollers out of the many factories on the Puget Sound directly aboard vessels bound to foreign ports. Piles, bridge timber, mining timber, railway ties, flooring, weather-boarding, stair lumber—almost every conceivable use is made of this truly beneficent tree.

No tree of the Northwest is wider or more thoroughly distributed than this. It is as though the Japan *Ku-ro Si-ua* and the trade wind had especially created this tree to clothe the drenched shores and mountain tops of the West, while the pines, firs, redwoods, etc., are but incidentals, chance products of little moment, and perhaps of transient duration.

The Douglas spruce, but slightly changed in appearance or qualities, is found abundantly in British Columbia and on all the cross ranges reaching to the western slopes of the Rocky mountains, and on nearly all the ranges paralleling the coast far into Mexico, the only considerable region omitted being the interior basin between the Sierra Nevada and the Wasatch mountains. What is also remarkable is the apparent equal vigor and enormous dimensions this tree attains whether near the sea-level in the coast mountains or on the Cordilleras, at elevations of 10,000 feet.

In favorable localities, it becomes 200 to 300 feet high and four to seven, often 8 to 12 in diameter.

Near a famous lumber camp, in the vicinity of the sound, I secured a photograph of a monster upturned tree, caught midway between two of its fellows, and affording a lofty platform for the operations of the lumbermen, looking like pigmies among these mighty monarchs. (See illustration.)

A tree near Webber lake, Sierra county, Cal., at an elevation of 7620 feet, was 240 feet high, 9½ in diameter and 560 years old.

Wherever any other trees are found flourishing best, no matter of what species, there the Douglas spruce is at its best also, as witness its enormous development in the noted groves of big trees in the Sierra, where it

AN UPTURNED TREE OF DOUGLAS SPRUCE—*Pseudotsuga taxifolia*.

vise with them and the sugar pine in size. No other tree seems to have such pliability of constitution, such powers to overcome environment, any soil and condition, any exposure almost, is welcome to this cosmopolitan tree, and this rare quality of adaptability to varied conditions has been wisely utilized by cultivators far and near, especially those interested in reforesting denuded regions of Europe.

Large quantities of seed are collected annually and sent abroad, and the nurseries of many provinces devote their greatest care to the production of seedlings, while large areas of forest preserves have already been planted to Douglas Spruce.

Principal of the Old-World countries intent upon enriching themselves by utilizing our spruce is Germany, and especially the Kingdom of Prussia. Second only to the Germans are the French, Belgians, Austrians, Swiss, Italians and English, while great quantities of seed are exported to our antipodes of Australia and New Zealand.

The Douglas Spruce has been most unfortunate in its botanical names, having borne a half-dozen different ones since its discovery by Capt. Vancouver in 1797. The subject of the determination of the right name for this tree is discussed in the lately issued third biennial report of the State Board of Forestry, commencing at page 133, to which interested readers are referred.—*J. G. Lemmon in Rural Press.*

The Lumber Trade.

In the year ending May 31, 1890, nearly 144,000 persons were employed in the lumber industry in Michigan, Wisconsin and Minnesota, receiving over \$30,000,000 in wages. The investigations of the Census Bureau indicate that the industry in these States will cease within six years, so far as it depends on lands held by individuals. Already employers have begun to prepare for the future by buying large areas of timbered land in other States. In Montana and Idaho they have become owners of over a million acres of fir and cedar, which it is estimated will yield five thousand million feet, board measure, of merchantable lumber.

In California, Oregon and Washington they have acquired over 1,200,000 acres of fir and redwood, and the estimated yield is nearly

28,000,000 feet. In Virginia, North Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Arkansas and Missouri, their holdings amount to 1,400,000 acres of yellow pine and cypress, which, it is estimated, will yield a total of over 11,000,000 feet, and in West Virginia, Kentucky, Tennessee, Ohio and Illinois they own 138,000 acres of yellow poplar and hard woods, which, it is estimated, will produce a total of over 1,100,000,000 feet.

These figures seem prodigious, and yet they make an aggregate of less than 45,000,000,000 feet, which is less than five times the aggregate output of white pine lumber from the mills of the Northwestern States in the year 1890, and less by 18,000,000,000 feet than the estimated amount of merchantable lumber lending on private or corporate holding in the States of Michigan, Wisconsin and Minnesota. On May 31, 1890, the Census Bureau had been unable to ascertain how much land still in these States belongs to the United States and how much to each of the States respectively.

DETERMINATION OF MINERALS.—The J. B. Lippincott Co. have just published tables for the determination of minerals by physical properties, ascertainable with the aid of a few field instruments, based on the system of Prof. Albin Weisbach, by Persifer Frazer. This is the third edition of this handy little book. The new edition of Professor Frazer's useful work marks many important advances in the knowledge of minerals, and its author notes, with proper pride, that the principle for which he contended in the first edition (1874), of the unity of the mineral manacle, in opposition to the theory of Professor J. D. Dana, "has been tacitly conceded by all modern writers, including Professor Dana himself." Professor Frazer has omitted altogether the supplementary tables to assist in the determination of those minerals of non-metallic lustre and colorless streak which cannot be determined by the aid of simple instruments and a close observation of their physical characters, and placed the most important prognostic characteristics and physical and chemical tests of each mineral in the column of "Remarks." The synonyms of minerals have been more largely given than in the previous work, and in some cases, such as garnet, sub-varieties have been added after the synonyms without much notice of the distinction between the two. It is a work which no mineralogist can afford to ignore. The book is sold in this city by Joseph A. Hofmann, 120 Sutter St.

Arizona Onyx.

The Phoenix (A. T.) Herald says: George B. McCann, the well known Yavapai county mining operator, who spent \$150,000 on some of that district's attractive quartz ledge, and who now represents the Los Angeles capitalist, Aaron Mason, former owner of the great Silver King treasure vaults, is just back from an inspection visit to the onyx claims of Holmes & Woodson on Cave creek, about 18 miles north of Phoenix.

These partners have a horizontal deposit from 12 to 20 feet, thick with a known length of 1200 feet, and extending into the hill an unknown distance.

The green variety of onyx largely predominates, although other colors can be obtained in large quantities. With respect to quality Messrs. Holmes & Woodson's deposit ranks with the fine grade of the Mexican onyx, against which it is protected by a duty of 60 cents per cubic foot, or \$6 per ton. The deposit has doubtless been produced by mineral springs which still exist higher up the hill.

Mr. McCann is a large owner in the Big Bag onyx beds, where ex-Adjutant General O'Neill has interested influential eastern and foreign capitalists. The former is frank enough to admit that these Cave creek quarries compare very favorably with his and General O'Neill's claims.

Within a week six or more men will be employed to open up the Cave creek beds. The present Cave creek road must be extended five miles to establish wagon communication with Phoenix. One alleged "expert" said that it would cost \$50,000 but Mr. McCann drove a pair of mules and a buckboard over the ground in its present state and brought back 500 pounds of the stone. Thus the expense of a road cannot be great and the county will be asked to assume it, so, when the quarries are rightly opened from two to five carloads will be shipped from Phoenix daily. This will require from 8 to 20 teams to move it, and double that number must be on the road constantly. Such a traffic will certainly justify the

cost of road extension five miles.

An advance of \$2 per cubic foot over Mexican onyx has been offered for this Cave Creek article, or about \$14 per foot for the green variety sorted out from other layers. A 3100-pound sample lot was shipped to Los Angeles last week, of which one-half went to San Francisco.

In Los Angeles, owners of fine houses are taking down their \$200 marble mantels and putting up Arizona onyx substitutes that cost from \$500 to \$600. The stone is only one point harder than marble and about 12½ per cent heavier, but it takes a higher polish and is not stained by ink or acids, as in Tennessee marble, the finest grade of that stone found in this country. Onyx blocks weighing ten tons can be readily mined in Arizona, and such an advantage in large architectural designs is readily appreciated by builders.

This Cave Creek onyx weighs about 200 pounds to the cubic foot. It can be quarried in the same way that marble is, and Mr. McCann will put such a plant on Holmes & Woodson's grounds immediately. The 500-pound specimen brought in by him this week has been sent to Yuma prison for polishing, and arrangements are being planned whereby the prison labor there may be utilized in working this valuable stone on a large scale.

If onyx should replace marble, as now seems not improbable, Arizona, by proper management, will undoubtedly secure the lion's share of so profitable an industry.

NEW ELECTRIC STATION.—The Edison General Electric Company will soon have a plant established in this city. On the 1st inst. the Edison Light and Power Company was incorporated with a capital stock of \$3,000,000, and on the day following the entire plant, franchises and other property of the California Electric Light Co., used in the central station for lighting this city, was transferred to the new corporation. The consideration for the transfer was \$1,000,000 worth of capital stock in the new company. Geo. H. Roe of the California Co. says the new company will at once begin the construction of a large central station, and will expend \$500,000 within the next six months. The wires will all be placed underground. The arc-light machinery will be transferred from the Jessie street station to the Townsend street station, and the former place is to be used exclusively for supplying Edison incandescent lights.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, July 11: Our mines are all doing well, with brighter prospects ahead. At the Hector, operations are progressing in a business-like way. The work of timbering the shaft has commenced. Material for the hoist is coming in, and the erection of the same will be started in a few days. The 40 stamps are kept running on surface dirt, which is said to pay expenses. Winter supplies are coming in at the Wildman—timbers, lagging, etc. The 30 stamps are kept in motion, and everything is looking prosperous.

Calaveras.

ANGELS.—Cor. Mt. Echo, July 10: While in French Corral, North San Juan, and many such places, you see only vestiges of mining and civilization; here you find not a "has been," but a real and energetic town. Scarcely have the mining interests opened yet, and as to development it is a thing of the future. There is but one company that has fairly sunk a shaft below the grass roots, and they have gone down but 600 feet. The Utica mine owned by Charles Lane, Alvinia Hayward and W. S. Hohart, has quartz to keep the mill crushing for seven years, without going down another inch. The pay-roll amounts to from \$10,000 to \$12,000 a month, and they are endeavoring to increase their business. They must find some gold, or they could not pay expenses.

El Dorado.

DARLING.—Georgetown Gazette, July 10: Lively times at the Darling mine. Some 15 men are now employed in the work of putting up the hoisting works for sinking the shaft and developing the mine in a thorough and systematic way. The management mean business and every move so far shows that they understand their business. Most of the men employed are residents of the locality, and such is the confidence in the mine and its successful operation that a feeling of permanency and security has already spread new life in that neighborhood. This week two loads of heavy machinery arrived at the mine, besides large quantities of lumber continue to arrive. Development work now going ahead on the Martin & Ambrose mine continues encouraging. W. S. Lyle, who has the mine bonded, was up from San Francisco this week accompanied by Wm. Pickett. After a thorough inspection and being well pleased with the development made by the present 50-foot tunnel run on the lode, it was decided to run another tunnel on the lode down on the hillside at a point giving 100 feet more depth, or about 240 feet of depth from the surface. Work of sinking the shaft on the Ben Franklin mine is progressing.

Inyo.

DARWIN MINES.—Index, July 8: Mr. J. A. McKenzie was in town yesterday and from him we learn that mining prospects in and about Darwin are better at the present than for some time past. Early developments are looked forward to with confidence.

MINING STRIKE.—James McDonald writes from Darwin to Sheriff Gorman that Frank Snrba and son have made a splendid strike there. At a depth of 140 feet they struck three feet of the finest kind of carbonate ore. Assays show 70 per cent of lead and 100 ounces of silver. This is said to be the best strike of lead ore seen in Darwin for a long time.

MODOC MINES.—Independent, July 10: The June output of ore from the Modoc mines amounted to \$604.47. A full force of men will be worked all summer in the main tunnel. Two shifts of men are now at work at the 300-foot point in ten inches of ore that goes 235 ounces silver per ton. Surface work will be discontinued until Sept. 1st, because of the scarcity of water. The property never looked better than at present.

PINE MOUNTAIN.—It is learned that Andrew Fife has bonded for \$7000 or \$7500 the Roberts mines at Pine mountain. S. P. Roberts, the late owner reserving the Baltic from the transfer. Roberts deserves to make something, as he has hampered away steadily there for the past 12 years. It is to be hoped the investment will prove a more paying one than the former smelting venture in the same region. A four-stamp battery was hauled up this week from Saline valley to the group of mines, and will be put up. The intention is to concentrate the ore and work it on a different system from that formerly employed.

Nevada.

ST. JOHNS MINE.—Grass Valley Union, July 12: Some ore showing very rich in free gold is being taken from the St. Johns mine. The ledge and rock is steadily improving. They are now taking out a few tons for a crushing as a test of the ore.

A NEW MINING ENTERPRISE.—Transcript, July 10: It is stated that arrangements have been made whereby a San Francisco Co., will this season put up milling machinery on the quartz ledges owned by Dr. Holdsworth and son. These claims are situated near Jackson Lake 12 miles in a northerly direction from Graniteville and on this side of the line separating Nevada and Sierra counties. The claims embrace a number of mammoth ledges which the Holdsworths have been prospecting for many years past by sinking and running tunnels. Milling tests of the ore have been made at various times with very encouraging results. The machinery to be erected will be taken to the mines by the way of Emigrant Gap, which is the most accessible railroad point.

THE GERMAN MINE.—Nevada Transcript, July 8: M. D. Cooley, superintendent of the German mine, which is situated on the south side of South Yuba river, in Mayhert district, was in town last night on his way back to the mine from San Francisco. Mr. Cooley is pushing ahead work in a quiet but very energetic manner. The lower tunnel, which will give 253 feet of backs, is now in 350 feet and should soon reach the large and promising ledge which was found in the upper tunnel. The pitch of the ledge is vertical. The lower tunnel has been run much of the distance through the hardest kind of rock, costing as much as \$20 a foot. If the results of the next few weeks' work are as satisfactory as the management has every reason to anticipate, machinery will be erected and the German will become

one of the big mines of Washington township. A first-class company has it in hand.

Placer.

SULPHURETS.—Placer Herald, July 11: A carload of ore containing sulphurets, from A. O. Bell's mine on Bald Hill was shipped up to Grass Valley last Wednesday by C. S. W. Smith. A small amount sent up to be worked not long ago went \$100 to the ton and the shippers think it will pay to ship all the mine products in the future.

Plumas.

DEVELOPMENT WORK.—Cor. Plumas National, July 11: A great deal of development work is now being done in this district. The mines here are attracting wide-spread attention. The indisputable evidence that great mines exist here is proven by the immense amount of gold that has been taken from the surface. A careful estimate based on data at hand, shows the enormous sum that has been gleaned from the surface alone, since the district was formed, to be \$25,000,000, and though this sum is immense, yet I firmly believe that it represents only a fraction of what still remains and is yet undiscovered. The great sources of this surface yield, lie locked within the walls of the great ledges that abound, and the gravel channels that are yet unopened. This field of undeveloped mines offers greater inducements to prospectors than any other within the whole mining belt of the State, but money is the all-important requirement. The surface mines are practically exhausted. The under surface mines must be opened and it is necessary to have capital with which to do it. When capitalists once realize the assurance that rich and permanent mines are here, they will not be slow in coming to the rescue. Peter Hansen is making interesting developments on his quartz mine on Big Creek; this mine joins the famous Edman mine and the developments spoken of bid fair to lead to something that will rival in richness its near neighbor the "Diadem." In the far known as Chicken Flat much gold was found in early days below the ledge. Strange to say, this part of the ledge had never been prospected. Mr. Hanson this spring ran a cut across the flat on the ledge and is now finding quartz of wonderful richness, one piece weighing six ounces and a half, containing five ounces of gold, while some of the gold is almost in a pure state, being free from quartz. A chimney of vast richness will surely be the result of Mr. Hanson's development. The Butte bar ledge is being vigorously prospected; a full crew of men is employed, night and day shifts being run. The quartz is said to be very rich.

LA PORTE.—Cor. Oroville Mercury, July 10: La Porte is on the eve of a mining boom. On entering the bank and store of Dixon Braban, we found Messrs. Thomas and McClelland washing an amount of gold taken from their mine several miles from La Porte, and they had about \$3000 in beautiful coarse gold taken from a bed of gravel, and it was taken by drifting through a flush flume. From that same mine over \$10,000 have been taken this summer, at an expense of \$1200. There are dozens of other mines in the community that are producing equally rich, and old La Porte is bound to boom as a mining center. In proof of this, it is only necessary to state, that during the past few years, Mr. Thomas has patented about eight miles square of gravel bed between La Porte and Gibsonville, and to-day there are two very wealthy companies developing the properties. One of the largest of these is the Thistle Shaft, a Scotch Co., superintended by C. B. Wingate, one of the most intelligent, as well as practical and industrious, miners in California. This company has possession of a large area of gravel bed, and is now, with three shifts of men, sinking a shaft and tunneling into the mountain. They have taken out gravel that pays immensely per car, but have not yet reached the main channel. Mr. Wingate is delighted with the outlook. He is working the latest improved machinery, and his mine will no doubt prove a bonanza. The above-named mine is an extension, or a part of the Bald Mountain Consolidated Gold Mountain Co., which was organized by Mr. Thomas and sold to English and Scotch capitalists. The Bald Mountain mine, superintended by Mr. Thomas, is giving promise of rich returns. Many smaller mines in the district are paying handsomely. We have no hesitancy in saying that next summer La Porte will experience a livelier season than she has in years. At Gibsonville we were also gratified to find the miners hopeful for the future. J. C. Walters ships several hundred dollars' worth of gold dust per month, purchased from small miners, and this fact shows that there is yet much gold hidden in the hills thereabouts.

Sierra.

FOREST CITY.—Nevada Transcript, July 11: The Bald Mountain Extension are putting on men as fast as room can be had for them. They now have a force of 30 and the number will soon be doubled. The gravel looks fine and pays well. John Schneider has struck it rich in the Lucky Boy claim, about one mile from Forest City. The Maple Grove tunnel is progressing rapidly. They are about to put on more men and push the work through as rapidly as possible with the expectation of having the mine on a paying basis by October. This mine will undoubtedly prove to be a genuine bonanza for the stockholders.

Siskiyou.

BLUE GRAVEL.—Cor. Yreka Journal, July 8: The developments so far made in the Yreka B. G. M. Co.'s shaft, which is now 35 feet deep, have demonstrated to the public that the originators of the enterprise knew what they were about. They spent several months in investigating and examining every feature of the business, obtaining in that time the opinions of many practical expert miners and scientific men, and finally satisfied themselves beyond a doubt that there is an immense channel of an ancient river running through the county from north to south or south to north, the direction in which the river ran being still a matter of uncertainty. They assured the people that they could sink a shaft and strike a bed of blue gravel, and that they could strike it in the first attempt. They have only been disappointed in one particular, and that is in striking the bed of blue gravel sooner than they anticipated. It was reached at a depth of 22 feet, the last formation lying over it being a strata of slate five feet thick. The shaft is now 15 feet in blue gravel cement, very hard and difficult to work. While the company were absolutely certain of striking this bed of blue gravel, of course they were not certain that it would pay, as all blue gravel is not

rich. So far, however, it has been proven that it carries gold, as a prospect can be obtained in any portion of it, not enough, however, to pay for working. At Cottonwood the blue gravel bed varies from 40 to 100 feet in depth, only the lower portion being rich, the upper part prospecting about the same as ours. From surface indications and the best calculations that can be made, taking the distance from the shaft to where the rock crops out between the shaft and the bed of Yreka creek, and granting that the bedrock has the same pitch to the east that the sandstone, slate and gravel formations have in the shaft, it is estimated that bedrock will be reached in about 50 feet more. This would make the gravel bed 45 feet deep, the extent to the east, of course, being an unknown quantity. At same point between the channel and Yreka creek the bed pitches both ways, that is, east and west, and the directors of the company believe that they know about where that point is. The benefit that the county, and more especially Yreka, will derive from the development of rich diggings in this channel cannot be estimated.

ORO FINO.—Siskiyou Telegram, July 11: Wm. Lewis of Oro Fino informed the Telegram that the mining outlook in Oro Fino was never better than at present. The Johnson mine, now owned and managed by R. H. Campbell promises next season to pay exceedingly rich, as the surface ground has been or will all he removed this season leaving only the rich bottom to be worked next year. The Allen Bros. mine was never better than at present, and 50 tons of quartz crushed averaged \$40 per ton.

GOLD.—Supervisor Jackson has shown us specimens of gold taken from his mine on Little Humboldt, which, without a doubt, are the richest we ever saw. The gold is taken from a quartz crevice in the bed of the creek, and is almost all solid gold containing but a small amount of quartz. Mr. Jackson informs us that he has over a quart of just such specimens as those shown us, and, in fact he has just as good a thing as he wants.

Trinity.

NEW RIVER.—Trinity Journal, July 11: A letter from New River, received too late for consideration last week, brings the information that the mill on the Ridgeway mine will be started up about the 15th of this month and that the ledge was looking very well.

NEVADA

Washos District.

MIDDLE MINES.—Virginia Enterprise, July 9: The Middle mines are now attracting attention. Interesting conditions are reported from Kentucky, Savage, Hale & Norcross and Bullion. One hundred and sixty feet north of the south line of Savage, on the 1100 level, a very promising body of ore is being developed. On the 1500 level of Hale & Norcross, to the south, the outlook is encouraging. In the south drift from the 1300 level of the Potosi incline winze station, which has been run into Bullion ground, crosscutting will soon be started, from which important results are looked for by local operators. An 18-inch streak of from \$13 to \$27 ore is reported as having been cut on the 1000 level of Kentucky.

ALTA.—Have started the tanks to help drain the water in the Gold Hill mines. Everything works well.

YELLOW JACKET.—Shipping 35 tons daily of silver-bearing rock, worth about \$22 a ton. Are not shipping gold-bearing rock at present, but waiting to ascertain the result of the last run made at the Santiago mill.

CHALLENGE.—The raise from the north drift from the 1100 level is up 55 feet, having been advanced 30 feet. The top shows porphyry.

CONFIDENCE-CHALLENGE.—The north drift on the 200-foot level is in 775 feet, six feet having been made during the week; face shows quartz of no value. Joint west crosscut on 300 level is out 120 feet; seven feet made during the week; face in quartz of no value. Joint north drift on the 680 level is in 667 feet from the Yellow Jacket shaft, 37 feet having been made during the week; face in porphyry. Joint east crosscut on 1000 level is out 47 feet; 12 feet made during week.

JUSTICE.—The north drift on the 822 level was advanced to face since last report, and is now out 757 feet; the face is in low-grade ore. Shipped 116 tons of ore to the mill worth \$17.06 a ton as per battery samples.

KENTUCK.—The north drift from the 1000 level, east raise, is out 23 feet—advanced six feet during the week; face in low-grade quartz. The west crosscut from the top of the north raise, 1000 level, is out 12 feet, and has cut a streak of ore 18 inches in width assaying from \$13 to \$27 a ton, and on which a raise was started July 7th. Have started a west crosscut from the 950 level raise at a point 25 feet above the track floor; it is in six feet and the face is in low-grade quartz.

CON. IMPERIAL.—West crosscut No. 1 from the main north drift on the 300 level is out 35 feet; face in quartz of no value. East crosscut from the 500 level has been stopped for the present.

SEG. BELCHER.—West crosscut from south lateral drift on 600 level has been advanced 12 feet, and is now out 188 feet; face in a mixture of clay, porphyry and streaks of quartz, with a little water running from it.

BELCHER.—The raise from the south lateral drift from No. 2 crosscut, 200 level has been advanced 33 feet during the week; the total height is now 128 feet; the top is in quartz showing occasional spots of pay. The north drift from the main west crosscut from the shaft, 300 level, has been stopped, and a west crosscut started from 100 feet in; it is out 29 feet in a mixture of low-grade quartz and porphyry. The 1300 level east crosscut has been advanced 20 feet since last report, and has reached what looks like the hanging wall.

CROWN POINT.—The south lateral drift from the 300 level south winze is out a total distance of 48 feet; the face is in very heavy ground, composed almost entirely of clay. The 500 level west crosscut has been advanced 20 feet since last report, and is now out 216 feet; the face is in porphyry and low-grade quartz. The east crosscut from the south lateral drift on the 1000 level has been advanced 16 feet, making its total length 221 feet; face in a mixture of porphyry and clay.

SAVAGE.—Milled 400 tons of ore worth \$17.65 a ton, as per battery samples. The "E" shaft tunnel is now repaired 800 feet. The west drift from the new station, Potosi tunnel level, was advanced

19 feet; total, 196 feet from shaft. On the 950 level we have extended a drift west from the top of the upraise 25 feet; expect to connect this drift the coming week with the bottom of winze from 800 level, and then commence the extraction of ore from this portion of the mine. On the 1100 level the north drift from the Hale & Norcross side was advanced 10 feet; total, 188 feet. The last 10 feet of this drift shows improvement—the ore is better grade. On the 1400 level east crosscut No. 2 was advanced a total distance of 54 feet to the east clay wall of the vein. No work done in the mine on the 4th and 5th.

HALE & NORCROSS.—The joint winze from No. 5 east crosscut on our south boundary is down 105 feet below the 1400 level; the bottom is in the foot-wall of the vein. We have had to retimber a portion of the north winze. Have not done any work in the north and south lateral drifts started from the new station 50 feet below the 1400 level since last report. On the 1500 level the south lateral drift was advanced 20 feet; total, 160 feet from station; face in porphyry and seams of quartz. The north lateral drift on this level was advanced 10 feet; total, 180 feet from station. No. 1 west crosscut started at a point 75 feet north from the incline was advanced 50 feet; face in low-grade quartz. No. 2 west crosscut, 75 feet north from No. 1, was advanced 10 feet; face in quartz carrying some pay ore. We have started two new crosscuts east from the north lateral drift, 1500 level. No. 1 east crosscut is started opposite No. 1 west crosscut, and No. 2 east crosscut is started opposite No. 2 west crosscut. Each of these crosscuts is advanced 10 feet. No work done in the mine on the 4th and 5th.

SCORPION.—The joint north drift from the 900 level of the Union shaft was advanced 18 feet; total, 209 feet from shaft station; face in soft porphyry and clay slips. The water coming in the face shows no increase since last report. No work in mine on 4th and 5th.

Tuscarora District.

DEL MONTE.—Times-Review, July 10: Joint west crosscut extended 21 feet, seams of good ore showing in the face of crosscut.

NAVajo.—South intermediate, 350-foot level extended 13 feet showing small seams of ore. The stopes are looking about the same.

NEVADA QUEEN.—South drift, fourth level of Commonwealth, advanced 11 feet. Low grade ore cut by east crosscut is coming in the face. West crosscut extended 10 feet.

BELLE ISLE.—Line crosscut, 350-foot level, extended 25 feet, the face looks very favorable for ore. No. 1 winze west, same level has been sunk 12 feet, the ore is looking very fine in the bottom. The stopes are looking well and have yielded 12 cars of first and 29 cars of second class ore.

COMMONWEALTH.—Fourth level—No. 1 winze sunk 21 feet, ore two feet wide of fair grade, strong flow of water coming in the bottom. No. 2 raise extended up 10 feet exposing 20 inches of ore, some of it being high grade. Work in north drift was suspended while starting winze and raise, but is going ahead now.

NORTH COMMONWEALTH.—Ten cars ore hoisted, average assay of car sample \$419 per ton. Third level—Joint west crosscut advanced 21 feet, passing through seams of good ore, flow of water is decreasing. Fourth level—Raise has been carried up 17 feet, 25 feet more will connect with third level.

NORTH BELLE ISLE.—East crosscut from 450-foot level Belle Isle, extended 10 feet, rock still very hard. No. 2 east crosscut, 400-foot level, extended 13 feet, still in quartz ground giving low assays. Have started an upraise on the east vein, same level, to prospect the vein above, progress 12 feet. West crosscut from the 600 station extended 14 feet, rock not so hard, and is beginning to show more water. East crosscut, same place extended seven feet, rock extremely hard.

White Pine District.

HAMILTON LEAD MINES.—White Pine News, June 7: Late arrivals from Hamilton inform us that interest continues to increase in several of the lead mines in White Pine district, and several mining experts from San Francisco have lately been there examining the properties. The most important of these—as they are the most developed—is the Cornell group on the eastern slope of White Pine mountain, owned by Tom Cornell, one of the old standbys of the district. Our informant says that the week before last, seven miners took out over 800 sacks of ore, running over 200 pounds to sack, which carries 65 per cent and about \$25 in silver. The net profit on this ore after mining, shipping and reduction charges are paid, is about \$30. The lead in the ore pays all expenses and leaves a profit of \$5 per ton on the lead alone to the owner. Mr. Cornell has, we learn, had several good offers for the property, one being for \$40,000. This would have been accepted, but the purchaser wanted time on half the money. Mr. Cornell thinks there is ore enough in sight to warrant the price offered and he wants it in cash down. Besides what is in sight, the possibilities are certainly very great. It's a poor man's mine, and if Tom doesn't get his figure he will continue to work it himself and grow rich slowly. There are several other good mines in the vicinity of the Cornell group, one of the best being owned by the McAllen Bros., from which they have shipped considerable good ore. They are now running a tunnel to tap the vein at greater depth. Roco Kragnaiz, another old-timer, is working eight or ten men on his mine on Babylon Hill, near the crossing of the Hamilton and Sherman road, and taking out and shipping considerable good-paying ore. He thinks of increasing his force to 20 men. There are many other good prospects in the base belt upon which their owners are now at work, which in time promise to show up as well as those above mentioned.

ARIZONA.

CROWNED KING.—Prescott Courier, July 8: The above-named mine is in Bradshaw district, about forty miles south of Prescott, and close to the Tiger mine. To get to it, one travels mostly through a high, timbered country. Jack Martin, foreman of the Crowned King, spent the Fourth in Prescott, and we squeezed out of him information which enables us to print the following: Mine is opened by three tunnels. No. 1 is 1050 feet long; No. 2, 550 feet; No. 3, 60 feet. No. 1 is 400 feet below the surface; No. 2, 250; No. 3, 50 feet. There is a shaft 50 feet. Tunnels have water. Vein averages 2½ feet in thickness. Ore, lead and sul-

phurets. Sixty tons of concentrates, worth from \$366 in \$397 per ton, were shipped, via Prescott, in the past three months. The gold is worth \$19 an ounce. In this time seven carloads of ore were shipped and 1,500 tons run through the mill. Mill's capacity, about 20 tons a day. All of this ore and the sulphurets had to be packed in sacks, on animals, about 15 miles, then hauled 35 miles, in wagons. Costly business, all will say. N. C. Sheekles has had charge of the mill. Has been ably assisted by Thos. Bowe, W. N. Cook, Henry Brown, Ed. Inward, Geo. E. Stone, Jerry Geren, W. S. Achner, Tom Smith and Al Skinkle. O. F. Place is one of the owners. More Frue-Vanners will be added to the plant. The mine is about 6,000 feet above sea level. It is surrounded by many more good gold and silver properties, and it is a great pity that there is not from this town to the district a direct road over which wagons can be taken.

WREN.—Jasper Phillips, lessee of this mine, is here, making another shipment of high-grade ore. He employs several men, and their efforts have been well rewarded.

BLACK HORSE.—John Sugden says men are sorting dumps. Mine quite wet. Machinery not sufficient to manage the water. Mr. Hall will work some of the ore.

ANTELOPE.—W. H. Durrutt says placer ground near Peeples Valley continues to pay well.

CONGRESS.—This wonderful mine keeps right on giving up rich sulphurets ore. The big mill is a great concentrator. Shipments are frequent.

VULTURE.—A new pipe line will soon be put in. Large bodies of gold ore that will mill from \$8 to \$12 a ton exist in the mine.

GLOBE DISTRICT.—*Silver Belt*, July 4: The first half of the year 1891 was a season of unusual prosperity for the copper mining industry of Globe. Favored by good weather the greater portion of the time, no serious interruptions to teaming were suffered, and an excellent demand for Globe copper, which ranks second only to Lake copper, has stimulated production. It is unnecessary, perhaps, to add that the supply of ore has been abundant. The Old Dominion Co. has had two furnaces in blast and the Buffalo one almost continuously, and notwithstanding the large quantities of ore smelted the supply is undiminished, the Old Dominion Co.'s mine especially showing fat ore bodies. The output of the silver mines of Globe district has also been considerable. Pioneer, Richmond Basin, Quartzite and other localities in the district have contributed to swell the production of silver, most of which has gone to Eastern reduction works for treatment. The Rescue S. M. Co., by far the largest producer, has mined more than 300 tons of ore assaying \$300 or more per ton in silver. None of this ore has yet been worked, repairs to the company's mill having consumed a longer time than was expected. Another week will see the work on the mill completed, when it will be started up for a long run. Globe is turning out more metal with less fuss and bluster than almost any other camp in the Territory.

BRITISH COLUMBIA.

HOT SPRING DISTRICT.—Nelson *Miner*, July 2: Reports from Ainsworth are, that the outlook for Hot Springs district was never brighter. Mining men are arriving there daily, and the boys who own prospects are acting wisely in offering claims at very reasonable figures. During the week Richard Ashworth purchased the Old Timer outright from Frank Ernest and George Schroeder, paying them \$2000 for it. Mr. Ashworth also secured a 60-day working bond on the Glangary from William Franklin and Alec McLeod. The price to be paid for the claim is \$6000. A force of men under the foremanship of Ed Roche, was at once put at work timbering the shaft preparatory to sinking on the property. Mr. Ashworth passed through Nelson on Monday on his way out to purchase machinery. Scott McDonald, superintendent of the McCune company, expects the crosscut started from the 200-foot station on the Skyline to reach the ledge by the 10th of July.

THINK THEY HAVE A BIG THING.—A new location near the Morning claim on Toughnut mountain is causing considerable comment. The ore is peacock and gray copper in quartz, and is pretty good looking truck. The discoverers, Harry Ward, Charles Dundee and A. R. Seamen, think they have a big thing, as the ledge is full six feet in width. They have named the find Cumberland.

HOLDS THE KEY TO TOAD MOUNTAIN.—Development work is being carried on on the Dandy in earnest. A tunnel has been started near the west end line, and by the time that is well under way machinery will be on the ground. New buildings for the better accommodation of the men are being erected, and a business air pervades the locality. Mining men generally concede that the Dandy M. Co. holds the key to Toad mountain.

DAKOTA.

SMELETER.—Deadwood *Pioneer*, July 5: When completed the D. & D. smelter will be an almost duplicate of the Parrott smelter at Butte, said to be the best conducted smelting enterprise in the United States. It makes a copper matte the same as Dr. Carpenter will make at the D. & D. smelter later on, having at the present time over 5000 tons of copper ores offered him monthly. The Parrott smelts ores of extremely silicious contents almost as had as the ores of Bald mountain and Ruby basin. It differs from Prof. Hill's Argo smelter in using a combination of blast and reverberatory furnaces, which will also be used by the D. & D. smelter.

IDAHO.

PLACER.—Idaho *World*, July 7: K. P. Plowman is now fixing up his placer claim for next year's work. He ran just two months this year and made a good cleanup.

THE DELAMAR COMPANY.—DeLamar *Nugget*, July 7: The work of doubling the size and capacity of the DeLamar Co.'s present mill was begun yesterday morning. Men have been put to work putting in cribbing in Jordan creek, in order to make room for the enlargement of the mill. The creek will be cribbed and substantially bridged over from the carpenter shop nearly up to the present wagon bridge. The company will at once commence putting in foundations for a large Corliss engine, which will be located close to the creek bank

nearly to front of the present boiler room. This engine will supply power to run a mill of double the capacity of the present one, and new batteries and twice the number of pans and settlers will be employed in the reconstructed mill. It is proposed to complete this work in 90 days, if possible, and it will be carried on in such a way that the present mill will be kept running steadily while the work is going on. The improvements will be principally added to the east end of the mill, and will occupy the ground up to the resort house. The new pans, settlers and pulp tanks will be placed on a line with the present ones, and the engine will be so placed that the belt, to drive all the lines of shafting, will connect with a driving pulley about where the present pulley is located. A new 10-stamp battery, with 950-pound stamps and double discharge, will be placed beside the present battery. An entire new battery of boilers will be put in, and it is contemplated that the new mill can run, with the same, or at a very small increased amount of fuel from what is now consumed. The new pans to be put in will be wooden ones adapted for the use of chemicals which cannot be used in the present iron ones. The present battery of stamps will eventually be replaced by heavier ones with double discharge. The contemplated capacity of the reconstructed mill is 100 tons per day. The plans and specifications are now being prepared for a much larger and finer mill, which will be built between the two little gulches which come into the creek below the present mill. As soon as work is fairly under way to improve the older mill, men will be put to work terracing the side of the hill and preparing the ground for the new mill, but work on the new mill will, probably, not be begun during the present season. When the new mill is completed, it will mean, with the present mill, a capacity of 80,000 tons of ore per year, and the entire plant will be the largest and most complete in Idaho.

MONTANA.

A FINE GOLD PROPERTY.—*Inter-Mountain*, July 11: W. W. Turney of Anaconda is in the city today. Mr. Turney, B. Smiley and Carroll Swain of Phillipsburg are the fortunate owners of what, from all reports, is a bonanza gold mine. It is situated in the Boulder mining district, above Granite mountain, and is the only gold proposition yet discovered in that section, though Mr. Turney says tons and tons of rich gold float can be seen in the timber and around the hills. The property in which he is one of the principal owners is operated under the title of the Royal Gold and Silver Mining Co. It was incorporated in May of this year, though they have been engaged in working their claims for the past two years. These consist of the Etna Extension and Pine Tree lodes, and 160 acres of placer ground. They are situated on a hill and are opened up by a tunnel which penetrates the three claims running on the course of the vein. The tunnel taps the vein 1500 feet from the surface. There are two discovery shafts on the property. The owners have been steadily developing the property and little has been said or heard about their operations, though from Mr. Turney's representations, and he is a reliable gentleman, they have another Drum Lumber. Mr. Turney reports that a great deal of prospecting is going on in the Boulder district. The Nonpareil mine is looking very well, but owing to a rush of water in the lower workings, the company has been forced to suspend until more ample pumping machinery is received.

NEW MEXICO.

THE CARLISLE MINES.—*Solomonville Bulletin*, July 7: There has been steady work and steady improvement going on at some of the mines three miles south from Carlisle, New Mexico, on the Duncan road, for several months, and in the vicinity of Jim Crow ledge. When the old Carlisle mine was closed over a year ago, it resulted in a general prospecting of the country surrounding it, by miners who had been thrown out of work, and it was not long until a rich strike was reported of silver and gold ore on the Jim Crow ledge, and since that time a number of important discoveries have been made in that vicinity. The ore is extremely high grade and the shipments that have been made yielded such satisfactory returns as to attract general attention and to stimulate development work on all claims. Those now at work are enthusiastic over the favorable outlook of the camp.

OREGON.

CINNABAR.—*Jacksonville Times*, July 7: The construction of the furnaces at the cinabar mines is giving employment to about 25 men and Mr. Sinn, the new superintendent, is pushing the work. A large party of eastern capitalists is expected through this region in a short time, with a view of investing in the many mines hereabout. Mineral experts think that the period of development of the quartz mines in this section has just begun. There are over 200 miners reported as being at the Diamond Peak mines already, and before the summer is over many anticipate a genuine boom. There seem to be paying mines there, and those who are first on the ground reasonably expect to secure the best locations. The Anderson mill has been running the past fortnight on a 50-ton prospect from the Pilgrim mine on Wagner creek, and if it pans out as much as \$3 to the ton of rock it is understood that the mine has been sold to a stock company of which Supt. Brand and Manager Koehler of the O. & C. railroad are the principal stockholders.

A VALUABLE FIND.—The other day while operations at the Nelson placer mines were in progress a boulder weighing fully 1000 pounds became detached from the bank against which the Little Giant hydraulic was playing and rolled down into the channel. Later on, when the miners attempted to remove it to the dump, they found that it was literally alive with globules of gold which covered its surface. Just how much gold the boulder contains cannot be known until it is broken to pieces, but S. B. Baisley, manager of the mine, who is authority for this item, says it is the most interesting and, perhaps, the most valuable find discovered in his long career of mining, and is firm in the belief that the boulder at one time was a part of a ledge that he will yet find in prosecuting his great tunnel through Carpenter mountain, and for the prosecution of which a company has been formed, backed with ample capital.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 7, 1891.

- 455,588.—BALANCE SCALE—Erastow & Rice, S. F.
455,596.—SECTIONAL CAM FOR STAMP-MILLS—I. K. Cleaver, S. F.
455,589.—CAR COUPLING—F. A. Fox, S. F.
455,590.—CAR COUPLING—F. A. Fox, S. F.
455,537.—ORE SEPARATOR—Good & Thorne, Portland, Or.
455,595.—ROCK DRILL—H. S. Grace, S. F.
455,619.—HOSE BRIDGE—B. E. Henriksen, S. F.
455,630.—DERRICK—O. M. Loveridge, Weaver, Cal.
455,647.—BRAKE-HEAD ATTACHMENT—J. H. Nethercott, S. F.
455,515.—DOUBLE-ACTING LIFT PUMP—O. W. Parker, Oakland, Cal.
455,465.—CAN FAUCET—C. M. Symonds, S. F.
455,523.—PICTURE CANVAS STRETCHER—E. P. I. Widell, Albina, Or.
455,498.—GOLD SAVER AND CONCENTRATOR—W. A. Woods, Santa Cruz, Cal.
455,677.—CRUSHING MILL—J. H. Yeaton, Colorado Beach, Cal.

The following brief list by telegraph, for July 14 will appear more complete on receipt of mail advices:

- California—Thomas C. Churchman, Sacramento, tongue support; Virginia M. Cone, Alameda, noiseless chamber attachment; Salome P. Davis and J. H. Dicks, San Jose, baby carriage; Robert B. Davis, San Diego, wave motor; Axel Johnson, Oakland, assignor to Marshall Improved Window Furniture Company of San Francisco, sash-fastener; Thomas Pepper, assignor of thirty-five forty-eights to H. T. Christian, E. W. Burnham and H. B. Sheppard, San Diego, windmill (continued); William F. Shedd, assignor by mesne assignments to the Electric Street and Station Indicator Company, San Francisco, street or station indicator; George H. Tietjen, assignor of one-half to G. H. Bales, San Francisco, street or station indicator for cars; Jonathan V. Webster, Creston, cultivator.
Idaho—John J. Morrison, Lewiston, vehicle axle coupling.

Oregon—James Gill, assignor of one-half to J. Gill, Portland, device for operating steam-engine indicator; Jane L. Landreth, Marshfield, rolling-pin combined with other implements; Walter J. Monteith, Albany, pliers.
Washington—Joseph Kormel, Goldendale, car coupling; Edward M. Plorat, Puyallup, baling press; Michael E. Riley, Montesano, ice-freezer.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DOUBLE-ACTING LIFT PUMP.—Orrin W. Parker, Oakland, No. 455,515. Dated July 7, 1891. This lift pump is especially applicable upon windmills, but may also be used in other connections. It consists of two independently-acting pumps, the barrels of one of which dip into the well or source of supply, and are provided with a piston, piston-rod and upward opening valves, and the second pump is adapted to receive its supply from the upper end of the first one. A connection is made to the open air between the two pumps so that each one works independently of the other. The piston-rods of the two barrels are connected with the reciprocating mechanism so that the two are reciprocated in opposite directions, and the two barrels while working together are essentially independent of each other. From the second barrel the water may be delivered to any desired height through a delivery pipe having the usual valve and air-chamber like a force-pump. By sub-dividing the work of each pump and making it independent of the other, the inventor is enabled to equalize the pressure upon each of the cranks and the pumping mechanisms, so that only about one-half of the column of water is to be lifted at one time.

BRAKE-HEAD ATTACHMENT.—Joseph H. Nethercott, S. F. No. 455,637. Dated July 7, 1891. This is a device for attaching brake-heads to brake-hams, and it consists essentially, in the hinging of one of the jaws, so that when one of the fastened bolts are removed the break head can be easily slipped off from the beam without disturbing other parts. As usually constructed, the brake-head is provided with two rigid jaws which clasp the beam above and below, and it is secured to the beam by bolts passing through the break-head or flanges which are formed upon it and the brake-beam. When for any reason the brake-head is to be removed from the beam, it is necessary, on account of the proximity of the wheel to the car, to release the brake-beam from the brake-rods and otherwise detach connecting parts so as to allow the brake beam to be moved backward and away from the wheel. It is then necessary to use a pinch-bar or other device to remove the brake-head from the beam, and the latter if made of wood is liable to be damaged in the operation. In this improved construction, the brake-head can easily be slipped off without disturbing the other parts.

SECTIONAL CAM FOR STAMP-MILLS.—Isaac K. Cleaver, S. F. No. 455,506. Dated July 7, 1891. This sectional cam is specially adapted for stamp-mills, and is one which may be easily removed or replaced upon the shaft without disturbing any of the adjacent ones. It consists of a two-part cam, with means for fitting and securing it upon the shaft or removing it therefrom. The construction is such as to prevent any end motion of the cam when it is put together, and also insure its being put on at exactly the right place when ever removed.

HOSE BRIDGE.—B. E. Henriksen, S. F. No. 455,619. Dated July 7, 1891. The object of this improvement in hose-bridges is to simplify the construction so as to make the parts of the bridge easily portable, easily assembled, and extended to furnish a bridge of indefinite length. Each section of the bridge being supported by two pairs of legs, will

stand firmly. A length of ten feet is very suitable for these sections, as it will extend over one line of car-track, and as many of the sections may be united as will bridge over a desired space. In streets where there are four or more lines of tracks an equal number of section must be employed. The construction is such that an entire section can be carried under a car-seat or hook-and-ladder truck or in any other vehicle.

DERRICK.—O. M. Loveridge, Weaver, Trinity Co. No. 455,630. Dated July 7, 1891. This invention relates to certain improvements in derricks, and is especially applicable to what the inventor calls a "hydraulic derrick" for which a patent was issued in Nov. 1, 1891, No. 248,938. The present invention consists in an improved method of securing the sheaves over which the hoisting rope passes at the head of the derrick-mast or the boom, in an improvement in the construction of the mast and boom in sections, so as to prevent winding or twisting, and in the means for securing the sections together. In the construction of derricks for use in hydraulic mining works the masts are often made of a length of 80 or 90 feet, and the booms of corresponding length to enable the workmen to move the boulders in a sufficient distance. When masts of this description are made of a single piece of timber a certain amount of winding and twisting in the length of the masts as the wood seasons is unavoidable, and the result is that if the hoisting sheaves are permanently fixed to the mast or boom in the usual manner and in a perfectly straight line when first put in, they will soon get out of position so that the hoisting rope will not lead fair over them. The improved mast and boom are made in two or more sections, the ends of which are abutted together and secured by clamps. If the timber twists or winds the clamp bolts are loosened and the clamps are turned till the pulley comes into proper line.

Mining Share Market.

The mining share market the past week was devoid of special interest. The pool is evidently carrying out its prearranged program, as outlined by this paper in last May, and confirmed in last month; viz., to have the lowest prices for shares to rule in this (July) month, and toward the close of the month start the fall deal; but the up move at the beginning is expected to be slow until outside confidence is restored, when by showing ore in unexpected localities get the grudeons excited so as to have them take the shares at a good round profit. That the pool has the ability and will unquestionably carry out this program, does not admit of the question of a doubt. If they cannot find buyers on this coast, they will get them in the East. Stocks are better and more closely concentrated than at any time within the history of the Comstock—and to unload the holdings at high prices to what are now ruling, is the next thing in order. As stated by the PRESS in last January, they will show up ore in one of the mines in the North End group, in one in the Middle group and in one in the Gold Hill group, but the Alta group will probably be ignored, the shares only moving in sympathy. The problem now to be solved by outsiders is in which mines the ore will be shown up and in which group the first showing will be made. The persons who guess it will make the most money. In outside mining shares there has been a steady absorption by the various pools in control, and everything now warrants the assertion that more activity will be witnessed soon in them with the Bodies (Bodie, Mono, Bulwer and Standard) making on merit, the highest up move. The Bodie shares were probably never before so well concentrated in the hands of a strong pool, one capable of making a big deal.

There is only one Frank operator in the Comstock shares, and that is Samuel. The Bodie Mining Co. has taken out and is still taking out high-grade gold ore and piling it on the dumps for milling soon, which causes the following ore question: What is the difference between Bodie and an outside stockholder? One is on the dumps and the other is in the dumps.

With D. O. Mills arrival in New York, and he, together with Senator Jones and F. G. Newlands soon to be on this coast, and Col. Mackey, Gen. Hayward and Com. Flood already here, it looks like a big deal in the near future.

From the Comstock mines our advices report that in Savage they are opening up a body of good milling ore that ought to net a large surplus. In Hale and Norcross they are still at work developing the recent find. From Potosi and Bullion our advices are of unusual interest. In Union, important work is being prosecuted. In Andes, they are preparing to show up the "Burning Moscow" ground said to belong to Con. Virginia. It is singular the latter company does not open up the 1400-foot level toward the northern line. In Overman, they are running on higher grade ore, and as all extra expenses (machinery, royalty, etc.) have been paid for, it is reasonable to look for better results soon. In the other Gold Hill mines important prospecting and developing work is under way.

From outside mining districts our advices continue of a cheering character from the Tuscaroras, Bodies and Quijotas. In the former district they appear to be developing considerable rich ore in three different mines. In the Bodies, they are still taking out from Bulwer the \$50 ore we mentioned last year. In Mono, prospecting is being done. In Bodie they are nearly through with the deadwork preparatory to showing up the rich ore run into last year. While doing the deadwork they have taken out several hundred tons of high-grade, over \$50 a ton, ore, and expect to take out considerable more before opening up and extracting last year's rich find of ore.

Mining shares opened this (Thursday) morning more active, but at lower prices with several brokers selling out their clients' stocks—all stocks sold were taken in by the pool's broker through other brokers. Under the Supreme Court's decision on Margin dealing in stocks, those brokers who sold their customer's stocks may yet be called on to make up the loss met by those who were sold out. It is a dangerous proceeding on their part, no written agreement or contract can substitute an agent for the principal, and the sales of customers' stocks on any such agreement will not hold, and the agent or broker is liable under the Supreme Court's decision. The only safe and sure way is to transfer the ownership of the stock, advance money on it and then any written contract will hold good.

MECHANICAL PROGRESS

The Micro-Structure of Steel.

At a recent meeting of the British Iron and Steel Institute, M. F. Osmond, of Paris, contributed a note on the above subject, and presented to the Institute a series of micro-photographs, which were exhibited last year at the Mining Exhibition, held at the Crystal Palace. Very mild steel is formed of polyhedral grains of almost pure iron, in each of which the iron presents a crystalline orientation, which is constant for the same grain, but which varies in the different grains. The grains of iron appear to be surrounded by foreign matter, carbide of iron. As the temperature is raised, the grains at first increase in size without changing their form, then they become elongated and form a group of parallel hands.

In steel of medium hardness the white portions consist of almost pure iron, and the dark portions consist of a mixture of iron and carbide, the "pearly constituent" of Dr. Sorby. In metal properly heated and well worked, the pure iron forms torn-up and discontinuous stripes; but when the temperature is raised, the formation of polyhedral grains becomes more and more evident, until the pure iron completely envelops these grains, and grows into them under the shape of fine parallel hands.

In hard steel, the pure iron behaves in a somewhat similar manner, but it is, of course, of much less frequent occurrence. He succeeded in obtaining for this metal a photograph, which shows when magnified, 300 diameters, the alternately dark and brilliant stripes, discovered by Dr. Sorby, and considered by him to be alternate lamellæ of iron and carbide of iron. Independently of any theoretical interpretation, one fact is clearly indicated by the photographs. This is, that each preparation defines not only the hardness of the metal, other things being equal, but also the temperature at which the metal was allowed to slowly cool. Moreover, as the structure and the mechanical properties are intimately associated, it can be easily imagined, without it being necessary to enter into fuller details to what extent microscopic investigations may furnish useful information.

NEW PROCESS IN IRON MANUFACTURE.—A series of experiments were recently conducted at the Crown Point Foundry, Leeds, according to the London *Colliery Garden*, with a new aluminium flux called *Stephenite*, from the name of its inventor, the late Mr. Stephen, of Birmingham. The patent flux, which is composed of alumina and emery, contains about 70 per cent of alumina. In its natural state this flux is not volatile like the refined commercial aluminium, but in a blast furnace, or reverberatory furnace, it gives off its metallic gases or vapors, which unite with the fusible iron, for which they have great affinity, and which acts as a condensing agent, whilst all impurities go to the liquid slag and are drawn off in the usual manner. Metal manufactured by means of this flux, it is claimed, will work equally well under the hammer with the most malleable wrought iron, and will harden up to the hardest steel. It is also stated that the metal will work over and over again, becoming hard or soft at the will of the operator; and tests have proved that in its soft state it will stand a tensile strain of 38.3 tons on the square inch, and when hardened 48.3 tons per square inch. Another point upon which stress is laid is that the use of the flux causes the iron to flow in a much more liquid state, and to remain in that condition a considerable time longer than by the ordinary process, thus preventing blowholes and faulty castings. By means of this invention, the promoters affirm, iron foundries will be able to make their own steel castings, independent of steel-works, by simply melting scrap steel in their own crucibles. In experimenting, the cupola was charged in the ordinary way with common pig iron and coke, and then the flux, which is in the form of briquettes, was added. In due course the molten metal was run off, and several castings were made. Some of these were immediately chilled, and examined by experts present, who considered the experiments had been successful.

THE RECOVERY OF METALLIC IRON FROM SLAG.—Mr. Walter J. May writes to London *Iron* in regard to recovering metallic iron from slag as follows: In very many cases the slag as taken from the furnace will be found to contain a large amount of iron in a metallic state, and which would well repay for any moderate outlay in its recovery; but one of the primary points is that all the work must be as nearly automatic as possible. The separation of the metal from the slag offers no difficulty, as a magnetic separator will effect this readily enough, and with a revolving separator having a series of magnets, part of which are out of current alternately at all times, the whole of this business is quite automatic. The troublesome part of the affair is the disintegration of the slag, and where this has to be taken from the old banks, it is a tough job, and an expensive one to get it in pieces sufficiently small to be first passed through a stone-breaker and then milled. The process I should personally adopt is as follows: Two fairly large pools of water about 10 feet deep would be formed, and run out over these would be a couple of truck-toppers, having the roads of which they formed

the ends at a fair height above the water. The slag truck would be "kicked" on to one of these by the engine, and the slag "ball" in its semi fluid state would be cast into the water, causing somewhat of an explosion, no doubt, but at the same time being broken up into small portions. Of course no one would be near enough to be scalded at the time. When one pool of water was sufficiently full, the water would be run off, the slag trucked up to the mill where milling was necessary, and the pool put in readiness again to receive the slag, after which the other pool would be emptied, and so on. This would save the first cost of blasting the old slag, and although a crude way of working, would be effective for the purpose intended. The milling and crushing processes would only be continued to the point where the most effective result would be had, and the total cost should be repaid by the recovery of 2½ per cent of metallic iron, anything over being profit.

MACHINE FOR MAKING STEEL BALLS.—In connection with the introduction of ball bearings for machine tools, an ingenious machine for rolling steel balls has been invented by Charles Fairbairn, of Manchester, England. This machine is provided with two horizontal disks, each having on one of its faces a spiral groove starting from near the rim of its disk, and ending near its center, with a feeding rim round the edges, the shape of the groove being half round in section. These disks are placed one above the other, with their faces in contact, and in this position are rotated in opposite directions. In the center of the lower disk there is a hole through, and the spiral groove ends in this hole. If a heated bar of steel is presented with its end to the disks so that it enters between them, the feeding rims in the disks grasp the rod and draw it forward until the outer ends of the spirals meet at the end of the bar at each revolution, and acting like shears, cut off a short length of the bar sufficient to make a ball. By the rotation of the disks, the steel is rolled around in all possible directions, and at the same time compressed in the grooves, which ultimately give a perfectly globular shape to the steel and deliver it to a bore, through which the perfected ball drops from the machine.—*London Engineer*.

A GERMAN GUN FOUNDRY FOR CHINA.—The Chinese are just laying aside their antipathy to modern inventions and progress. The last report from Europe is to the effect that Messrs. Krupp are negotiating an important contract with the Chinese Viceroy, Li Hung Chang, for the construction and fitting of a factory for cannon and small arms at Tientsin. The place of the factory is to be near the Kaiping coal fields, and Krupp are to undertake the establishment of the factory and the working of it for a certain number of years, after which it will become the property of the Chinese Government, Krupp meantime to have a monopoly of the manufacture of the articles produced by the factory. It is further stated that the negotiations are being carried on by the German Minister in China, and that he has paid for the concession in the shape of diplomatic complaisance, the precise nature of which may appear later on. At present it is said not to be unconnected with certain advantages obtained by the Chinese in the discussions preceding the recent Imperial audience to the foreign representatives in Peking.

TWO CYLINDERS IN ONE.—A novel method of constructing compound locomotives which is almost as radical as the idea of compounding itself was, has been put into practical and successful operation by F. W. Johnstone, superintendent of motive power of the Mexican Central Railway. Coal costs about \$11 per ton on the Mexican Central, and Mr. Johnstone undertook to reduce fuel consumption by the introduction of a compound system of his own in which the high-pressure cylinder is encircled by the low-pressure cylinder.

The high-pressure cylinder is 14 inches in diameter, and the low-pressure cylinder has a diameter of 30½ inches, which is equal to a cylinder 24½ inches in diameter. The stroke is 24 inches, and the two rods of the low-pressure piston are coupled with the single high-pressure rod to one crosshead. In a competitive test of 12 trips with a single engine the compound locomotive showed economy in fuel of about 25 per cent., which means a great deal on a road where the fuel account is the largest item of operating expenses, being 22 per cent of the total.

CUTTING OFF STEAM.—Just exactly where the length of the cylinder of a steam engine should be cut off to give the best results in steam consumption, says the *American Machinist*, has never been plainly determined. Then outside this there are other considerations that call for figures. Altogether, the subject is a complicated one.

A LUMINOUS HARNESS.—A harness that looks luminous in the dark has been invented. It is intended to prevent collisions between vehicles at night.

The portion of a locomotive the most subject to wear is the crank pin, its life being 60,000 miles; 66,733 will constitute the life of a 33-inch wheel.

FIFTY ONE metals are now known, as against seven 400 years ago.

SCIENTIFIC PROGRESS.

Chemistry In Mining.

Tempering Steel Tools for Mining Purposes.

Coisels, drills, and picks, require careful treatment in sharpening and tempering. The student ought first to know that steel is a compound of iron and carbon; indeed it partakes more of the character of an alloy than that of a compound. So much is this the case that when some varieties of pig iron are examined the graphite or carbon may be seen as a distinctly separate crystallization. Cast iron contains from two to five per cent of carbon, and steel contains from 3. to 1.8 per cent. Carbon is removed from cast iron by oxidation, cast iron being melted in the puddling furnace bottom and riddled by the puddler in such a way that the surface of the metal is constantly exposed to the oxidizing influence of the atmosphere when the carbon is burnt out, leaving malleable iron in the furnace bottom. Indeed it may be said of iron that it is easily carbonized, and easily decarbonized. This being the case the smith has to exercise very great care in heating steel for sharpening purposes. If the temperature be too high the steel is decarbonized and rendered worthless. Tools ought not to be heated to more than blood red, and quickly hammered into the required shape. During the process of tempering steel, if the skin of the tool be cleaned, certain colors are seen which denote the molecular changes going on at different temperatures. To understand this clearly take a bar of steel with a clean skin, which has previously been made very hard by plunging it into the water when red hot, and slowly heat it, when a wave of straw color will pass over the surface; next on a further increase of temperature the straw will change into purple, and still further heating the purple will change into a blue color. Now each of these colors are indices of different degrees of hardness, the straw being hard, the purple less so, and the blue moderate hardness; that is supposing the bar of steel to be immediately cooled at the moment the particular color is seen. In cooling off a tool care must be taken not to produce a line of fracture. This may be illustrated with a common glass bottle. Set a bottle into a dish and carefully pour hot water into the dish until the bottle is immersed to a depth of two inches; if the bottle be now taken out of the dish, and slightly tapped, the bottom will fall off, because a line of fracture has been produced; the expansion of the heated molecules of the glass have torn themselves asunder from the cold or unexpanded molecules; precisely the same thing occurs with steel if heated or cooled carelessly. On tempering a drill or chisel, if the chisel be held steady with a certain line coinciding with the surface of the water, the chisel will break at that line when it is put to use; but a thoughtful temperer gives the tools an upward and downward motion in the water when cooling off, so as not to produce a line of fracture. Mining tools of all kinds ought to be tempered in coal tar and not in water; the tar being a bad conductor of heat is less apt than water to produce a line of fracture, besides the chemical action is such that the tar restores the carbon lost by heating in the fire.—*Ex.*

Atmospheric Moisture.

It is not to be wondered at that the ancients regarded water as one of the elements of which all things are composed, for it is a truth demonstrated by modern chemistry that almost all natural objects contain a large proportion of water. Not only the plants that drink the summer showers and show by their juicy succulence that they have incorporated the liquid streams into their substance, but the very soil in which these plants grow, and the solid rocks themselves, contain a large proportion of water. And when we take away from animals, and even from man himself, the water which they contain, the amount of solid residue left behind is surprisingly small. It is true that in all these cases our senses give evidence of the presence of water, and do not require the corroborative testimony of chemical analysis. The moisture adhering to soil and to rocks, the juice of plants and the blood and other fluids present in animals, all evidently acknowledge water as one of their chief constituents, and testify plainly to the presence of this liquid. But if we were to suppose that water is always absent from these substances, which to our senses give no evidence of its presence, we should commit a great mistake. The dry and solid rock consists largely of water; and clay, though baked in the summer sun and dried in the summer breeze, cannot be robbed of all its moisture. When the washerwoman buys 14 pounds of transparent and apparently perfectly dry soda, she in reality pays for nine pounds of water, and gets but seven pounds of real soda, instead of the 14 that she supposes she is getting. In short, water is present everywhere—in the dry wood that has for years formed our furniture, and even in the apparently perfectly dry dust that blows about our streets. Even the air, on a dry and sultry day, when everything is parched, and when every breath seems to burn our throats, is charged with moisture. That warm and apparently dry air contains moisture is easily proved. An ice pitcher becomes covered with dew, not because the pitcher sweats

through from the inside, as it is said to do, but because the water held in suspension by the hot air, even when apparently dry, contains a considerable amount of moisture. Procure a small quantity of salt of tartar, a cheap drug that may be obtained from any apothecary, and on a dry day lay it on a common plate and expose it to the atmosphere. In a short time it will have attracted from the air an amount of water sufficient to dissolve it, and it will have become converted into an apparently oily liquid, called by the old chemists, who did not fully understand the changes that take place, oil of tartar. The experiment will be more convincing, perhaps, if the salt with its containing vessel—which in this case, however, should be as light as possible—he placed in the pan of a moderately delicate pair of scales and carefully counterbalanced. In this case the abstraction of the moisture from the air is rendered evident by the gradual increase in the weight of the salt, and the descent of the pan in which it is placed.

If, then, moisture may be regarded as everywhere present, it becomes a nice point to determine when anything, such, for example, as the air we breathe, our houses, bed, clothes, etc., may be considered damp. To look for perfect dryness would be a vain search; nor would it do us much good if we could find it. Perfectly dry air would remove the moisture from our bodies so rapidly that we would wither as if smitten with the blast of the simoon. In such an atmosphere our throats would be parched as if in an oven, plants would wither and nature become one universal desert. But on the other hand, air that is too moist, that is to say, air that is really damp, produces effects that are equally disastrous. In such an atmosphere metals rust or corrode, vegetable matters rot, and the growth of fungi, such as mildew, mold, etc., is greatly promoted.—*American Engineer*.

THE RECENT GUNPOWDER EXPLOSION near Rome has excited considerable interest from the fact of some careful scientific observations which the explosion made possible. The amount of gunpowder exploded was quite large—about 50 tons, and the effect was, of course, very terrific. The magazine being located between two hills the main force of the explosion was upward, the pressure of the air quite uniform everywhere, producing some very interesting scientific phenomena. The action of the blast manifested itself in two ways—by an earthquake and by an air-wave. The vibratory movement of the earth traveled with greater velocity than the air-wave; so much so that the shock was felt in the city and the suburbs several seconds before the report was heard. Flower-pots, lamps and bottles were upset in closed rooms protected from any rush of air. The blast set the barometrical column in violent motion, beginning with a pressure of about 550 pounds per square meter, followed by a counter wave of suction. The first was marked by an increase of 14 millimeters in the barometer, the second by a decrease of 14.11-25 millimeters. The power of suction of this last wave was such that 90 per cent of the windows were blown not inward, but outward, the fall of broken glass in the streets wounding some 300 passers-by. The movement in barometrical column lasted 66 seconds, although it is believed that one-third only of that prodigious mass of powder had time to ignite. The greater portion was blown up bodily, its explosion taking place gradually. Grannies of powder were collected as far distant as Ponte Milvio. The report was heard and registered not only at Schiavo, Viterbo and Anagni, but also at Caserta, Ischia and Pesaro, at a distance of more than 200 miles.

TWO NEW FORMS OF SULPHUR.—Two novel modifications of this most Protean element have been recently discovered by Engel, says *Industries*. The first, like that proved to exist in Wackenroder's solution, is soluble in water and very unstable. The other is crystalline, soluble in carbon disulphide and chloroform, and polymerizes slowly in the cold, and quickly at a temperature of 100° C., but unlike prismatic sulphur, which changes on keeping into the octahedral variety, it becomes converted into the white insoluble form which commonly constitutes so large a percentage of the material known as "flowers of sulphur."

IMMENSE DYNAMOS.—Five electric dynamos of 10,000-horse power each are being built to be placed at the Deptford Central Lighting Station at London. These machines are veritable giants in proportions, and are designed to operate 200,000 lights each. Complete they will be 45 feet in height, each with armature ring 35 feet in diameter, the armature and the shaft will weigh 225 tons and the field magnets 350 tons more, making a total of 575 tons, not including the massive bed plates upon which they will stand. An engine 48 feet high will be attached to each end of the armature shaft.

ARTIFICIAL PRODUCTION OF RAIN.—Preliminary experiments for the artificial production of rain have already been made in the vicinity of Washington. It is expected that the ornamental experiment will soon be undertaken in some locality in Kansas. So much has been said and written, pro and con, in regard to the project of producing rain by means of explosives at some considerable elevation above the earth that the results of the forthcoming efforts in that direction are looked for with much interest.

GOOD HEALTH

Intemperance Successfully Treated as a Disease.

There is an institution at Dwight, Illinois, which has been in existence for a number of years, where intemperance is treated as a disease and cured. The institution has become quite famous, and from all accounts the treatment appears to be a decided success. People go there from all parts of the country. Professional men from the highest walks of their profession; business men—in fact all classes and vintime to all manner of slavery, from men who drink paregoric to opium fiends of the worst imaginable type, and 95 out of every 100 are said to return to their homes cured of their affliction.

A Pittsburg (Pa.) paper, in speaking of this institution, says that it is one of the most wonderful discoveries of all time for these habits, and thousands upon thousands of homes are being restored and made happy once more by this remarkable man. The paper adds that there are a dozen or more well-attested cures from Pittsburg, most of which were given up as about hopeless long ago.

That intemperance, when long continued, develops into a disease entirely beyond the control of the sufferer, and which can be made to yield only to the action of medicine, is a theory which has long been maintained by many, but which is now fast becoming acknowledged by the great majority of medical practitioners.

Dr. Leslie L. Keeley, the founder of this institution, has long held to this theory. He is a practicing physician of the allopathic school and surgeon of the Chicago & Alton Railroad. He has been long at work with his cure, but the world in general has heard but little of him, because he had been full of business and has preferred to become more generally known through the results of his practice. It is said that he has successfully treated over 6000 patients during the last ten years, fully 95 per cent of which have been reported as permanent cures.

He has made no effort to advertise his cure, probably in consequence of the absurd practice of the profession that such a course is held as unprofessional, and any one who so offends is boycotted by his medical associates.

Whether the remedy is secret or not we are not informed. The information at hand simply informs us that the patient may come to the Doctor either drunk or sober—it makes no difference which. The treatment is daily and consists of the administering of a hypodermic injection of "a bright red liquid," which is done at the office. The patient is then given an eight ounce bottle of "bichloride of gold mixture," which he takes to his room. A teaspoonful of this mixture in a quarter of a glass of water is to be taken every two hours while the patient is awake. The hypodermic injection is administered three times a day—morning, noon and night. The time of treatment generally occupies about three weeks, although it is sometimes extended to four. The hypodermic, from the account before us, seem to be intermittent—administered a few days and then withheld for a few days, according to circumstances of the case. The basis of the cure appears to be the bichloride of gold mixture, which is taken internally.

There is no need that liquors should be kept away from the patients. The Doctor keeps them in all variety in his office, and deals them out freely in drinks to any of his patients who wish them; but after two or three days' treatment they become nauseating to the patient and are refused. After a complete treatment, a person would be obliged to do violence to his appetite and will in drinking any kind of spirituous liquors, but by doing so repeatedly he may create a new appetite for the intoxicating cup. But it is almost incredible that any one who has passed through the fires of such a disease would deliberately go to work and kindle them anew after they have been once extinguished.

We have condensed the above from an account written by a New York gentleman who has recently been taken successfully through the "treatment." The writer, who is evidently a gentleman of standing and well informed, occupies three columns in the New York *World* in his well-written narration, in which he says: "I have stepped out of the shadow into the sunshine—out of the darkness of death into the golden glory of life. So firm am I in the belief of the great work of healing and physical reconstruction accomplished for myself and thousands of others at the little village on the prairie of Illinois, that I cannot rest until I tell the story to those who have known me in the city of New York, which has been my home for almost half a century."

So much interest and importance attaches to the above that we have taken steps to learn directly and through an independent source the full truth in regard to it, which, when it reaches us, we shall place before our readers in full. We have seen a number of references to this alleged "cure" in our various exchanges, but never before have met with such a full and apparently truthful report as the one from which this account has been condensed.

WEARING A BADGE.—It is stated that workmen in Japan usually wear on their caps and back an inscription giving their business and employer's name.

USEFUL INFORMATION.

CAUSE OF IRRIDESCENCE IN OLD OR ANCIENT GLASS.—Examples of ancient Cyprian glass were noted for their gorgeous iridescence, unproduced by artificial means. So far as is at present known, this effect can be produced only by the corrosive action of the air and moisture of the soil in which these objects have been buried for centuries. A microscopic examination of this glass shows that the surface is covered with exceedingly thin transparent films formed by matter dissolved from the glass. The body of the glass is pitted over its entire surface with minute cavities, which are spherical, elliptical or oblong in outline, and either spherical, ellipsoidal or cylindrical in respect to their concavity, and the films conform to the pitted surface of the glass. These films, of which there are many superposed, are so thin as to float in air like down when detached. They decompose the light by interference due to reflections from the front and rear surfaces of the film, and give rise to the gorgeous play of color.

ALABAMA SURPASSING PENNSYLVANIA.—The Washington correspondent of the *Philadelphia Ledger*, states that a forthcoming census bulletin will show that Alabama produces in one year more iron ore than Pennsylvania. The importance and significance of this statement are evident when we reflect that Pennsylvania has long been the great iron center of the country. That a Southern State should now take first place indicates a remarkable shifting of capital and industrial forces. The *Ledger* correspondent admits that "the South will be the future iron-producing center of the United States." The superintendent of the census is quoted as saying that the three future centers of iron manufacture will be Puget Sound, on the Pacific Coast, Birmingham, East Tennessee, and North Carolina, in the South, and the Pittsburg region in the North.

A PURPLE METAL.—It is reported, says *Iron*, that Professor Roberts-Austen has discovered a new alloy of gold and aluminum, the precious metal being present in the proportion of 78 per cent. It is described as the most brilliantly colored alloy as yet known. Its color is a rich purple, and by the reflection of light from one surface of the alloy to another bright ruby tints are obtained. Other alloys of the metal with gold have also been known; 1 per cent of aluminum gives the precious metal the color of green gold, and there is a very white and hard alloy containing 10 per cent of gold.

AN ENGLISH CENSUS is taken in a single evening, and within two hours of time, and costs only about as much as it does in this country. In 24 hours from the time of "listening," the result is ready to be given out, and as correct as human ingenuity can make it. The English may be slow in some things, but taking a census is not included among those things. Every traveler, tramp and citizen is caught and included. There is no time to dodge, and the officers, which includes the constabulary, are not to be fooled with.

TO CIRCUMVENT CHICKEN-THIEVES.—It is said that a resident of Waterbury, Conn., has devised a new plan to circumvent chicken-thieves. He uses copper rods for roosts, and these he has connected with a battery in his bedroom. When a thief tampers with the hen-coop an alarm rings at the proprietor's head, and by pressing a button a shock is sent through the roost, and the whole congregation of fowls crow and cluck in vociferous noise.

BANANA FLOUR.—A flour is made from green bananas. They are allowed to mature so as to be readily peeled, when they are sliced and dried, then pounded in a mortar and passed through a coarse sieve. The color of the flour is a dirty gray, like ashes. Ripe bananas are sometimes preserved by being dipped in lye and then dried in the same manner as figs. They shrivel up under this treatment, and when eaten taste much like figs.

CHANCE FOR INVENTORS.—There is an opening for an ingenious American to discover, patent and place upon the market an automatic ship-scraper for cleaning the bottoms of iron and steel sailing ships when under way. A wide application could be made of a convenient and portable automaton of this description.—*Marine Review*.

BEER FOR WASHING SILKS.—Probably the best use to which beer can be put is for washing silks. It gives old silk a luster and a new look almost like goods fresh from the loom. Then, too, it gives a little "body" which lasts for a considerable time; but eventually shakes out.

TO REMOVE EFFLORESCENCE FROM BRICKWORK.—A method recommended by *Painting and Decorating* for removing the white efflorescence which often appears on the face of brickwork is to wash the surface with a sponge dipped in a weak solution of muriatic acid.

CRIME IN ENGLAND.—During the past few years crime has decreased to such an extent in England that over \$1,000,000 a year less is spent upon prisons than was the case ten years ago.

ENGINEERING NOTES.

The Ship of the Future

It is common experience with ship-owners and shipbuilders to have propounded to them means whereby even 30 knots per hour may be realized, and these backed up by very elaborate calculations as proof, but which, when investigated, are found, like those of a well known writer of scientific romance, to be wanting in some little detail, insignificant at first sight, but absolutely essential to complete the proof. So far no great departure from the existing form of ship, nor from the method of propulsion, has resulted in obtaining a higher speed than is common with ordinary ships of the same dimensions; and in nearly every case such departures have mortified the inventors as well as disappointed the public by turning out absolute failures; and there is no good reason to suppose that further successes than have already been attained will be achieved in any other way than by improving the conditions that now obtain, both as regards form of ship and method of propulsion, inasmuch as the physical causes which combine to retard the motion of a vessel, and the physical forces which are employed in overcoming that resistance, remain to-day as they ever were, and are—in fact, Nature's immutable laws.

The commercial question is also one that presses very hardly at all times and must continue to do so more and more, as will be seen later on. The Atlantic greyhound of to-day is, in immersed form, substantially that of the Viking's craft of more than a thousand years ago. And if we look to Nature for our study we shall find that the swiftest fish are not unlike in general form to the submerged part of a ship, and the comparison is the more easily accepted when it is remembered that the fish is wholly submerged while the ship is only partially so. The one has to contend with waves and other surface disturbances, and must perforce keep above the water, while the other is free from such disturbing elements and conditions, and pursues its course in practically smooth water.—*Scribner for July*.

THE SUEZ CANAL TOO SMALL.—"The most important deduction," says the *Engineer*, "to be obtained from the annual report of M. Ferdinand de Lesseps to the shareholders in the Suez Canal is that the facilities of the waterway are rapidly falling behind the enormous increase of traffic, and that before long probably even the relief afforded by the recent diminution in the time required for transit, will be found insufficient. The report shows that during the year no less than 3,389 vessels passed through the canal, giving a total receipt of £2,697,000. The principal work carried on in the period covered by the report has been the widening of the maritime canal by 15 metres. This work has been carried from the tenth mile, from Port Said to the fifteenth, and it is intended during the present year to carry it as far as the twenty-second mile. The other widening works also in course of execution have been continued vigorously, and the new basin at Port Said has been excavated to its full width for a length of 300 m. The crowding of the canal is so severely felt that the engineers have determined to abolish the supply of stores, etc., by water to the stations of the company between Port Said and Ismailia. The boats and barges at present employed will therefore be displaced in favor of a steam tramway, which is now in active construction. The Egyptian government has entered into negotiations with the company for the employment of this tramway as a public line for the transport of passengers and merchandise. One other noteworthy feature of the report is the statement that the development in the petroleum commerce of Port Said has rendered it necessary to undertake the construction of an isolated dock at that place for the accommodation of this traffic. At the annual meeting of the company in Paris the whole of the resolutions presented by the committee of management were approved, and MM. Chabrières-Arles, Boucard, Guichard, and Lord Brassey were elected directors.

ANCIENT SHIP RAILWAYS.—It is more than probable that the Egyptians were in the habit of transporting vessels overland across the Isthmus of Suez, and tradition records that 23 centuries ago a true ship railway, with polished granite blocks as rails, existed and was worked across the Isthmus of Corinth, where the construction of a ship canal has been projected. In 1718, the well-known Count Emanuel Swedenborg constructed a road and "machines" for carrying laden vessels from Stromstad to Iddefjord, in Sweden, a distance of 14 miles across a rough country, and the successful use of this work by Charles XII. during the siege of Frederikshall led to Swedenborg being regarded not only as a national benefactor, but as a mechanician of no mean ability for at least a century after his death.

MORE TIME WANTED.—The Chignecto (Canada) ship railway will not be completed as soon as was expected. The company has asked the Canadian Parliament for an extension of time until July 1, 1893. Much interest is felt in the early completion of this work, as it will effectually solve the long mooted problem of the practicability of raising a loaded ship out of the water and transporting it across any given Isthmus.

ELECTRICITY.

Progress in Electric Railways.

Electric railways have become quite common both in this country and in Europe. There are now about 270 different electric railways in operation in the United States, operating about 1160 miles of track. The longest electric railway in the world is said to be in North Carolina. It is 41 miles in length. Considering the rapid progress made in this direction during the last decade, it is not unreasonable to assume that it will not be many years before electricity will supersede steam in every class of railway locomotion. Many prominent engineers think that not only that result will be reached, but that the speed of travel will be greatly increased.

The First Idea of an Electric Railway

Was developed in this country in 1835, when a small model circular railway was constructed and exhibited in Springfield by Thos. Davenport. This was three years previous to the application of the electric motor by Jacobbi in Russia. In 1842, a Scotchman, Davidson by name, built a five-ton electric locomotive, which was tried on the Glasgow & Edinburgh railway. It attained a speed of five miles an hour. The experiment was made in 1847 at Pittsburg, Pa. But no real practical success was reached in this direction until 1833 and '84.

In all the early experiments in electric railways, the motive power was derived from primary batteries of some form, which were carried on the car or locomotive. The great cost of producing electricity by such means necessarily resulted in failure, and it was not until the dynamo solved the problem of cheap electricity that electric railways became practical. The dynamo was first applied to railway locomotion by Siemens in Germany in 1879, the next in Paris in 1881. The first use of the dynamo in this direction in America was made by Stephen D. Field and Thos. A. Edison in 1880.

Boston's Successful Railway.

Probably the most successful and best equipped electrical railway in this country, if not in the world, is to be found in Boston. It is known as the West End system, and last year 114,000,000 passengers were transported over this road. It is thought that the net earnings overrunning expenses this year will be \$2,311,000. The road is a mixed service—a large number of horse cars still running upon some of its branches, but it is intended to change to an entire electric system at an early day. When these changes are all made the capital will be extended to \$16,400,000. The number of cars now running is 2400.

EDISON'S LIGHTS FOR SAN FRANCISCO.—An important negotiation has just been completed in this city by which the Edison General Electric Company will soon have a plant established in this city. On the 1st inst., the Edison Light and Power Co. was incorporated with a capital stock of \$3,000,000, and on the day following, the entire plant, franchises and other property of the California Electric Light Co., used in the central station for lighting this city, was transferred to the new corporation. The consideration for the transfer was \$1,000,000 worth of capital stock in the new company. George H. Roe of the California Co. says the new company will at once begin the construction of a large central station, and will expend \$500,000 within the next six months. The wires will all be placed underground. The arc-light machinery will be transferred from the Jessie-street station to the Townsend-street station, and the former place is to be used exclusively for supplying Edison incandescent lights. As soon as possible the company will establish additional stations in various sections of the city.

ANOTHER ELECTRIC DEVICE of wonderful character and interest is said to have found its way to the front. It is a contrivance by which it is claimed a photograph may be reproduced at a distance by means of electricity. The machine is small in size, and made of iron or brass, designed to be connected with a telegraph battery. A photographic negative, upon which the image is in relief to the extent of about one-thousandth part of an inch, is fixed in position, a trace making a perfect engraving on wax or metal at the other end of the line, from which the print may be taken. When the transmitter passes over a light portion of the subject, the receivers cause a depression at maximum cut, to be made upon the surface, and when, in case of a dark portion being under the transmitter, the receiver makes no record.

ELEVATORS operated by electric motors are growing in public favor for use in private. They are designed to carry three passengers, and the apparatus by which they are operated is described as being very simple and compact.

An important gold discovery is reported about three miles south of Dun Glen, Nev., on the Auld Lang Syne lead.

The 1890 record for British lifeboats shows a saving of 555 lives, besides rescuing 27 vessels from destruction.

To make paper stick to a wall that has been whitewashed, wash the wall with vinegar or saleratus water.

Passing Events.

The institution of a suit against a Placer county mining man by the Government officials makes it look as if the crusade against the hydraulic miners would in future be carried on by the Government instead of by the Anti-Dahris Association. This is a had outlook for the hydraulic mines.

Judging from the reports of the men who have visited the breaks in the Colorado river bank, it is possible that the water will make a permanent lake in the low portion of the desert recently flooded. In that case, the adjacent lands could be cultivated and utilized, as the water could be used for irrigation purposes.

There is a demand for a lower rate on ores from the mining districts of the coast, to reduction centers. The present rates are in many instances prohibitory. A marked reduction would start into life many districts now practically abandoned.

A new tin-mill is being put up at the Temescal mines, San Bernardino, with a capacity of 65 tons of ore per day. The first tin-mill in South Dakota is expected to start up about next April.

The great Pennington air-ship did not fly from Chicago to St. Louis, but went on a freight car.

Freight Rates on Ores.

San Francisco ought to be the Swansea of America; ought to be, but is not. The whole regions of country east, north and south of the city abound in mines of every kind and description. Every variety of ore is available, and available in quantity. From Mexico and the Central American countries ores can be brought by sea, as they can from Oregon, Washington, British Columbia and Alaska. But those regions of our own country not on the coast line, from which the bulk of the ores must come, are dependent on the railroads.

And here lies the difficulty of making this a great smelting center. The railroad companies which control entrance to this city have not yet realized that they can build up the mining industry and make a large business for themselves by charging a much smaller rate on ores than at present prevails. Their schedules on ores need an entire revision and intelligent investigation.

By encouraging the development of mines and shipping of ores, one-quarter of the business of the Union Pacific railroad is now from the mines. The Northern Pacific Company, with this experience before them, are beginning to fall into the same line. But our own local roads have not yet given the matter the attention it deserves, and maintain rates which are to a certain extent prohibitory and calculated to discourage rather than encourage mining.

The Union Pacific, which has built up an immense mining business for itself, charges about three-quarters of a cent per ton per mile on ore. The Central Pacific charges three, four and five cents for the same service; and, moreover, it charges a much higher rate on rich ore than it does on poor. It does not seem to realize that rich ores are scarce and costly to extract, since the very rich ledges are usually small and more expensive to mine. When the high expense of mining and of freight are considered, together with the comparatively small quantity obtainable, the miner quits work in disgust, for he finds little left for himself. We ought to have a freight rate from Grass Valley to this city of not over \$5 per ton, and that on ores from Arizona should not be more than \$7. With those rates thousands of tons would come here. The mining industry of Nevada is languishing because the miners cannot ship their ores for prices which would leave them any profit. There a hundred districts in that State which would be actively developed and support a large population could the miners ship their ores, but which are now practically abandoned and worthless. Arizona and New Mexico would send their ores here if they could, and their mining resources would be developed if freight rates were reduced.

Ores from Chile, Central America and Mexico now all go to Europe for beneficiation, which would come here by sea, were there an extensive plant where ores would be brought as abroad. The plant should be one with a large capital to advance on any quantity of ore that might be offered. The Grant smelter at Omaha and the Globe at Denver think nothing of having 16,000 or 18,000 tons of ore on hand at a time, all purchased from miners. Agents go in all directions to buy up the ores. South of us from the one port of Mazatlan, some \$4,000,000 worth of ore goes every year to Europe to be worked, which we ought to get in this city. But we do not reach out for these distant ores. In fact, the ores near by do not come in the quantities they should by reason of the freight rates.

We have fuel, climate, mines and all conveniences; an ocean in front of us and mines on the other sides. The region, for instance, in Northern California and in Southern Oregon could alone furnish an immense quantity of ore, could it be shipped at reasonable rates. The Northern Pacific charges \$20 per ton for taking ores from Grant's Pass mines, Oregon, to Portland. It depends on the value, what the charge is for bringing ore from any camp along the line of the Southern Pacific roads to this place.

It is high time that the roads centering in this city should make an intelligent examination into this question of ore rates, with a view to enliven the mining industry in this and adjacent States and Territories. The companies have it in their power to increase fourfold the output of the mines of the coast, and relatively increase their freight business in this

direction. Hundreds of camps would start up again if it were possible to ship the ores to advantage. The smelting works now being operated here could increase its plant and its capacity, and would doubtless do so, and there would be business for others as well; but under present conditions there is not much chance for enlargement of the ore-hauling or smelting business of San Francisco. There is no place in the United States with the geographical advantages for a smelting plant that this has, yet we have seen the ore business slip away from us and go to other places where competing railroads brought rates to a point to encourage instead of discouraging the miner.

It is, however, by no means San Francisco alone which would be benefited by lower rates on ores, but other places in California as well. Custom mills, reduction works and chlorination works have been established at different points, which would find their business more than doubled could the low-grade ores of the country be shipped from the mines. Concentrating plants would multiply, and wherever erected the surrounding region would be developed. Many of the interior towns of the State already have works for the beneficiation of ores, and they would all be given more business were freight rates cheaper. In fact, the railroad company has it in its power to greatly assist not only the miners, but the interior towns, and make better times all around if they would investigate this subject and put the rates on a basis which would admit of more mines being worked than there are at present. Colorado and Utah are working thousands of tons of ore annually which are shipped to the reduction works from small mines. There are hundreds and hundreds of unworked mines on this coast which would again be operated could the miners ship their ores without seeling all the profit go for freight.

The Portland Smelting and Refining Works.

We had a conversation this week with Mr. J. J. Gove, of the Portland Smelting and Refining Works, who is here buying ores at Grass Valley and elsewhere for shipment to Portland, Oregon. The works of the company are at Linton, seven miles from Portland, and the first run of three weeks was made a short time since successfully. Ores are purchased in California, Oregon, Idaho, Mexico, and wherever they can be procured. Several lots of sulphurets have been purchased at Grass Valley, which will be smelted. After roasting them, the iron is utilized as a flux for other ores.

The capacity of these works is 80 tons per day. The water-jacketed furnaces, 32 by 76 inches, were made by Fraser & Chalmers. The company intends to do its own refining, having put up a plant for that purpose. This company is not the one which went out of business some time since at Portland, but a new one, with the following directors: J. McCracken (President), N. B. Oatman (Vice-President), O. F. Buoker (Secretary), W. Selover (Manager), Ohas. Hegale, A. H. Johnson and J. C. Moreland.

The lead ores are obtained from the Coeur d'Alene District, Idaho. This district is now producing about 300 tons of concentrates per day, the material being concentrated from three to five into one. Some lots of ore come from around Baker City, Oregon, but not much to speak of as yet. The works have bought considerable Mexican ore. They expect to ship more from the northern counties of California and southern counties of Oregon in the future, provided better arrangements can be made with the railroad company. By sea from this port the freight to their wharf in Oregon is \$2 per ton. With lower rates to tide-water, large quantities of ore would be purchased, which cannot now be handled.

The Government and Hydraulic Mining.

An important mining suit is on trial in this city, brought by the U. S. District Attorney against Mr. James Gleason of Iowa Hill, Placer county, to enjoin him from selling water from his ditch to miners. Usually, cases for injunctions against hydraulic mining have been instituted and prosecuted at the expense of the Anti-Dahris Association, but in this instance the suit has been commenced by Government authorities. If we are correctly informed, this is the first time such a prosecution has been undertaken at the Government expense, and it

is, therefore, more than an ordinarily important case.

It is contended by the miners that they purchased their gravel lands from the Government for the purpose of mining them by the hydraulic process, and that the Government had no right to sell them the mining ground under these conditions, and then prevent them from working it. However, it is evident that the Government, through its courts and officials, is taking a hand in the stoppage of this branch of mining, ignoring any such argument as the miners advance.

Tin-Ore Mills.

The four pneumatic stamps for the new mill of the San Jacinto estate have arrived from Birmingham, England, and will be put up at the Temescal mines six miles from Riverside, San Bernardino county. The mill will have a capacity of 65 tons of ore per day. It is stated that 10 concentrators of a form new to this country have also arrived, though the Frue concentrators tried on the tin ores of the mine were reported as very satisfactory in their working.

The Harney Peak Mining Co. of South Dakota which owns nearly 1100 tin-deposit claims among the Black Hills, has no mill yet, though there are reported to be some thousands of tons of ore on the dumps. They intend to have a mill, however, and count on its being done by next April, when they expect to turn out eight tons of pure tin a day. As soon as the first mill is done they will begin on five others, and the President of the company thinks that by April, 1894, the six mills will all be running. Why they will take so much time to put up these mills, when they have so many mines and so much ore on hand, is not clearly explained. The Dakota tin mines have been known for some years, and it seems strange that active measures have not been taken to erect mills and beneficiate the ore.

The Temescal mines of this State are producing tin and will produce more as soon as the new mill now on the ground is ready for operation.

Silver-Lead Ores.

Assistant Secretary Spaulding, writing from Washington to the Collector of Customs at this port, referring to a letter from the Collector relative to the practice of not assessing duty on the copper in silver-lead ores, says, that according to a report obtained from the Collector at New York, the practice at the latter port is to assess the duty at the rate of one-half cent per pound on copper in excess of two per cent contained in such ores, by virtue of paragraphs 138 and 191. In the opinion of the New-York Collector, silver ores containing any percentage of copper would be liable to duty on the copper contained therein, at the rate of one-half cent per pound, under the provisions of paragraph 191 (N. T.), understood by his office to relate to copper in the form of any ores. As the practice prevailing at New York, and so far as the department is informed at several other ports, does not appear to be inconsistent with a reasonable construction of the provisions of the tariff relating to ores, and has not been made the subject of protest by importers, the San Francisco Collector is advised to adopt the same at this port.

Hoisting Engine for Mines.

The engraving on page 33 represents the Lidgerwood improved double cylinder reversible link motion hoisting engine, with double spur gearing. This latter feature is a decided advantage in all kinds of hoisting, either where the duty is heavy, or where safety is particularly desirable, as the gearing being double—and either set capable of carrying the entire load with safety—the danger from accident is almost impossible, and the strains being equally divided, the engines are more durable. The engraving shows the engine as fitted with automatic safety brakes, which, however, are only put on when ordered, the regular engine being furnished with an improved hand friction brake. This brake, while not absolutely necessary, is an additional security against accident. Every one of these engines is thoroughly tested with steam before leaving the works. The Parke & Lacy Co. are agents for these hoists on this coast.

Slate-Picking Chutes.

In the PRESS last week we gave our showlog the rolls for breaklog coal, and on this page are engravings of the slate-picking chutes by which the slate is separated from the coal at the mine. Originally the coal coming from the screens passed down a simple chute or trough and men and boys picked out the slate as it passed by, but there were several objections to this; as much slate was hidden, it was hard to tell what work each picker did, and pieces having a slaty appearance were often picked up by each slate-picker in succession and returned to the chute.

For these reasons a different type of picking chute has been adopted at the Cross Creek col-

FIG. 1.—EGG AND STOVE COAL INTERMEDIATE PICKING-CHUTES

tility of slate and coal, which has been passed through a screen and properly sized, the slate, if placed edgewise, would drop through a slit over which the coal would pass. The fixed automatic slate-picker, which is of cast iron in one piece, consists essentially of a series of V-troughs, one side of the V being shorter and at right angles to the other. The lower half of the casting has a taper slit (4) on the short side. The slit is so arranged that anything log on the long side of the trough, and of not too great height, can slide out through it. Any lump which is thicker than the height of the slit will, of course, be retained in the trough. The slits widen as they approach the lower end, and the part of the casting below the cross-bar (5) hangs freely, so that there is

FIG. 2.—EGG AND STOVE COAL COMBINATION PICKING-CHUTE.

BROKEN-COAL INTERMEDIATE PICKING-CHUTE.

FIG. 3.—COMBINATION OF EGG AND BROKEN INTERMEDIATES.

lieries. It consists essentially, first, of a supply chute (8), Figs. 2 and 3, which receives the slaty coal, and of intermediate chutes (1 and 1), Figs. 1 and 2, where the picking is done; and third, of the delivery chute (10), Figs. 2 and 3, which carry off the coal picked over. The coal from the screen or jig, slides, as shown by the arrows, down the supply chute (8), on each side of which the intermediates, 1 and 1, are placed as close to each other as possible, there being room (14) enough between each two picking chutes for a man and a boy. At the other end of the intermediate is the delivery chute (10).

The supply and delivery chutes have the same inclination, but the former is a little the higher, so as to give a slight inclination to the intermediate, the axis of which is placed at an angle of about 8 to 10 degrees with the horizontal and 25 to 28 degrees with the supply chute. The slate-picker, who sits with his face toward the upper end of the chutes, causes a thin stream of coal to pass in front of him, cleaning it thoroughly as it passes. The same coal is handled by one man only, with this exception, that one or two men are placed at the end of the delivery chute to inspect the coal and take out any pieces of slate that may have escaped the regular pickers. Immediately over the supply-chute, and supported on iron rods, is the hell round slate-chute, into which the pickers throw their slate, slate coal, etc. This continues to the bottom, where it is examined, and the slate-coal is picked out and taken to the rolls to be broken up and prepared. This style of picking-chute is suited for broken, egg, stove and chestnut coal; for broken coal 1, Fig. 2, and for egg and stove coal 1, Fig. 1 are used. For steamboat coal an analogous form

FIG. 4.—AUTOMATIC SLATE-PICKER.

is employed, the supply-chute being longer and the picking-chute larger, steeper and narrower, only one lump at a time coming down the chute. The automatic slate-picker, Fig. 4, depends

nothing to stop a piece from sliding through the slit.

This slate-picker is placed in an ordinary trough or chute, down which the coal slides. It receives pitch enough to allow the coal to slide over freely, but with not too great velocity. As the coal and slate come down the chutes, each lump places itself in one or other of the grooves or troughs, which are made a little wider than the largest lump of the size for which the picker is to be employed. As the lumps slide down, all the flatter pieces tend to pass out through the slit on the side, while the chisel lumps go over. Should a piece catch in the slit in consequence of the increase in height toward the end, some one of the pieces which follow will generally knock it loose, so that it does not remain and block the slit. This is an important point. The slits, if made parallel, would soon clog. The flat pieces, which are mostly slate, and which fall through the taper slit, pass over a chute or picking-table or any convenient place, where they are examined by a boy, who takes out any flat coal that may come through with the slate. With the larger coal, such as broken and egg, a great deal of what goes out is often coal and slate-coal, which is carefully picked out, the slate going in a chute to the slate-drag, which deposits it on the dirt bank. But the flat coal, slate-coal and honey (if valuable) are re-broken and are prepared with the other small coal that comes from the mines.

The rumor of another cave in the Utica mine at Angels Camp was incorrect. Mr. Laue, the superintendent, telegraphs that there is no cave and no probability of any. The mine was never more safe than now.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE ORIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbine for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

GREAT REDUCTION!**BATTERY SCREENS.**

Best and Cheapest in America.

**PERFORATED SHEET METAL**

For Flour and Rice Mills, Grain Separators, Revolving
and Shot Screens, Stamp Batteries and all kinds of Min-
ing and Milling Machinery. Iron, Steel, Copper, Brass,
Zinc and other metals punched for all uses.
Inventor and Manufacturer of the celebrated Slot Cut
or hurred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 16 (fine).
Orders promptly attended to.
San Francisco Pioneer Screen Works,
221 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

**QUARTZ SCREENS**

A specialty. Round, slot
or hurred slot holes. Home-
made Russia Iron, Homo-
geneous Steel, Cast Steel or
American planished Iron

Zinc, Copper or Brass Screens for all purposes. Call
for a Perforating Screen Co., 145 & 147 Beale St., S. F.

The instrument represented in the above cut is a
new and grand little invention, being designed to
save life and limb, and innumerable lawsuits, by
doing away with the dangerous operation of digging
out wet and unexploded loads where Giant Powder
is used in mining. The little instrument crimps the
cap on to the end of the fuse firmly and a aban-
dioned Water-tight. It is also used for cutting the
fuse. They are neatly gotten-up of the finest
cast steel, nickel plated. Price, \$2 each, or the
entire instrument finished in gold plate, \$5.
N. W. MOODEY, Fresno, Cal.

INVENTORS, TAKE NOTICE!

GOLD MINES

— AND —

STOCK IN MINES FOR SALE.

Dividend-paying Mines for \$150,000 np.
Undeveloped Mines for \$10,000 np.
Undeveloped Mines on Bond.
Stock in Dividend-paying Mines from \$1 np
Stock in Undeveloped Mines now being
opened from 25 cents np.

All situated in the GRASS VALLEY MINING DIS-
TRICT, the Oldest Quartz Mining District on the Pacific
Coast, and the Richest and most Permanent in the
World. The mines of this district are practically inex-
haustible, as nearly half a century of constant working
is proof. Grass Valley has the deepest regular dividend-
paying gold mines in the world, and the end is not yet,
for these same mines are as rich to-day as at any time
during their history.

Gold mining, especially in Grass Valley, when under
honest and scientific management, is one of the safest
and most profitable of all American industries. It is a
business that will return annually a profit of from 100 to
300 per cent on the investment. Mining is a science
acquired only by years of study, combined with practical
experience. Therefore, failure is the rule whenever the
management is ignorant and unscientific.

The undersigned is a practical scientific and successful
miner, has made mining a life study and vocation, is
honest and trustworthy, and will not, under any circum-
stances, recommend or deal in any but valuable paying
property and properties that will develop dividend-
paying.

No Wildcat Mines; no Sharp Practices; no reasonable
chance for loss; Honesty and Square Dealing Guaranteed.
Correspondence solicited.

Full particulars by applying to

S. B. FOWLER, Supt. Hartley Mine,
Grass Valley, Nevada Co., California.

THE RUSSELL PROCESS.

For information concerning this process for the re-
duction of Ores containing precious metals, and terms
of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

S. F. MARKET REPORT

Local Markets.

SAN FRANCISCO, July 16, 1891.

The change for the better in the weather noted last week has continued, greatly relieving the trade of the uneasy feeling caused by the extreme hot weather of about two weeks ago. Harvesting has progressed under the most favorable circumstances, and as the crops are much larger than in 1890 and the prices about 20 per cent more, it is claimed that for the next fiscal year there will be more general prosperity than ever before. The California wheat, barley and hay crops this year are estimated at about \$60,000,000. To this must be added other cereal crops, fruit, vegetables, etc., which will go well up toward \$100,000,000. Money is easy. The very large disbursements in this month are going into circulation and will soon be available for placing by bankers and others. At the East sterling exchange is easier and falling, this indicates that heavy exporting of produce is again setting in. It is the prevailing opinion in financial circles that Europe will soon begin to send gold to this country.

QUICKSILVER—Receipts the past week aggregate 253 flasks and exports by sea 263 flasks to Mexico. The market appears to have a steadier tone, although reports are still current of cutting in prices.

MEXICAN DOLLARS—The market is fairly steady at 80½¢@81¢. Some dealers are looking for better prices.

SILVER—The market has fluctuated, closing strong. Commencing soon there will be a largely increased demand in England, France and Germany for silver to pay for Asiatic imports, particularly those received from India. This demand, coupled with a free call from Spain, Portugal and one or more of the South American countries, ought to send the price to very nearly par by next December. The election contest in Ohio will be closely watched and the result looked forward to with deep interest, owing to free coinage of silver being an important plank in the Democratic platform, while the Republicans oppose it. The result of the election will have great weight in the next Congress on the subject.

BORAX—Receipts the past week aggregated 340 cts. and shipments by sea 645 cts. to New York. The market is steady, with a fairly firm tone.

LIME—Receipts the past week aggregated 4178 bbls. There is a fair export demand, while the home demand is steady.

TIN—Imports the past week aggregated 2445 pigs from Sydney and 4680 bxs plate by overland railroad. The market is dull and heavy. It is now being conceded that the outlook is not favorable to those large holders who bought expecting to unload at a good profit, after the tariff went into effect. It is quite likely that lower figures will obtain before the close of the year.

IRON—The market does not present any features deserving particular notice. In the East, the market is inanimate; the railroads have not bought more than one-quarter of the usual purchases of rail, while machinery men are also behind, the only class showing increased purchases is agricultural implement manufacturers.

LEAD—The market holds to steady prices. At the East, and also on this coast, there is a slightly creased consumption.

COPPER—The market is fairly steady. English cables report the market dull, but with the outlook favorable for a still larger consumption. At the East there is a steady increase in the stock of Lake, but a growing scarcity of cheaper grades. In New York very little, if any, Arizona ingot is on sale. The bulk of the product of the mines is under contract and it is stated that Pig copper would bring 12c, on dock, to-day. Casting brands at less than 12c are not readily obtained as smelters still experience difficulty in securing furnace material at a cost relatively lower than 12½¢ for ingot.

COAL—Imports the past week aggregated as follows: Comox, tons, 4300; Coos Bay, 450; Departure Bay, 2416; Nanaimo, 6278; Sydney, 5504; Liverpool, 2252; Newcastle, N. S. W., 1864. Total, 23,064 tons. Imports the past week were free, while the demand was barely steady. The coast output is expected to increase from now on. From Australasia our advices indicate that more tonnage is offering for August-September loading. The quantity of Australian coals on the way to Southern ports and to San Francisco is represented in the following registered tons of ships reported: San Diego, 10,900; San Pedro, 4675; San Francisco, 46,417. Total, registered tons, 61,992, equal to a carrying capacity of nearly 100,000 tons.

Eastern Metal Markets.

By Telegraph.

New York, July 16.—The following are the closing prices the past week:

	Lead.	Tin.
Thursday	100 3/4	13 1/2
Friday	100 3/4	13 1/2
Saturday	100 3/4	13 1/2
Sunday	100 3/4	13 1/2
Monday	100 3/4	13 1/2
Tuesday	100 3/4	13 1/2
Wednesday	100 3/4	13 1/2

The large output of copper by the Lake mines is against the copper market, yet European advices report gradually depleting stocks. Tin is easy at a decline. Lead is steady, as is borax. Quicksilver is Steadier.

411 Mission St., San Francisco.

The German Savings and Loan Society,

526 California Street.

DIVIDEND NOTICE.

For the half-year ending June 30, 1891, a dividend has been declared at the rate of five and four-tenths (5 4/10) per cent per annum on term deposits, and four and one-half (4 1/2) per cent per annum on ordinary deposits, payable on and after Wednesday, July 1, 1891.
GEO. TOURNEY, Secretary.

Practical Mining Expert.

HAVING ASSOCIATED MYSELF WITH MINING FOR the last 35 years, including three years through five of the principal mining States of old Mexico, I am now prepared to examine and report on formation, together with the permanency, as well as the character of the vein, whether gold, silver, copper, lead or tin. Address JOHN C. COX, Santa Rosa, Sonoma County, Cal.

MORE ATTENTION.

NOTICE IS HEREBY GIVEN THAT ALL PATENTS and inventions of Charles Cummings for Compressed Air Rock Drills and Air Compressors are the property of The Cummings Rock Drill Company, by contracts and assignment from Charles Cummings, duly recorded in the U. S. Patent Office, and any infringement thereof will be prosecuted by THE CUMMINGS ROCK DRILL CO., 59 and 61 First Street, San Francisco, Cal.

BLOWING ENGINE FOR SALE.

Vertical pattern, with balanced steam slide valve gear, steam cylinder 14 in. diameter, air cylinder 40 in. diameter, stroke 24 in. 1 to 100 strokes per minute; engine new. For price and particulars JAMES LEFFEL & CO., Springfield, Ohio.

SITUATION WANTED.

By a man 42 years old, with 7 years experience in gold, silver and opal mining and surveying; graduate of the Mining Academy in Schemnitz, Hungary. References in Hungarian (Magyar) language. Content with moderate salary until he proves his ability. Address FREELAND, P. A., Lock Box 52, G. S.

PIPE WORK AND LAYING OF ANY KIND.

New way of joining all joints better than old lead joint in any work of work. Special attention to mines, and all work appertaining to laying of pipe done with dispatch. GEO. W. CRAWLEY, 908 Shotwell St., San Francisco.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented Oct. 8, 1889, and Dec., 1890.

ANGELS, CALAVERAS COUNTY, NOV. 22, 1890.
 JAMES TULLOCK, Esq. Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, adaptable in construction of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
 WOODSON GARRARD,
 Supt. Gold Cliff Mine.

HELENA & IDAHO GOLD MINING CO., SUPERINTENDENTS
 OFFICE, GIBBONSVILLE, IDAHO, O. T. 6, 1890.
 MR. JAMES TULLOCK, Angels, Cal. Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting, and the other one is all ready to start. They were so easy to set up and run that I forgot all about it. A "letter of instruction" until they were set up and running, and you recalled to my mind your letter and instructions. Yours truly,
 MYRON K. RODGERS, Supt.

ANGELS, CALAVERAS CO., NOV. 22, 1890.
 JAMES TULLOCK, Esq. Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, 100 ton stamps, for over six months last past, and I heroby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours,
 T. M. LANE, Supt. Madison Mine.

Price, \$450.

Stamp Cam.

Declaration of Levy Brown on Spiritualism.

SPANISH CAMP, June 16, 1891.

Mr. Bagen came to my place in 1887 and brought with him two men who desired to examine two quartz ledges, which they wished to prospect and, if satisfactory, to purchase the same. One of them liked the ledge on the east side of Big Canyon and was anxious to buy, but said his money was East. He wrote for the money, but failed to get it until his bond expired. After they left I felt fatigued, and laid down to rest and fell asleep. Woke up soon. When I got on my feet I heard the noise of a quartz mill. The stamps struck one, two, three. After that there was a general roar from the stamps. Ran one or two minutes and then struck three, two, one. In about two minutes I heard three distinct whistles from an engine. I wish to sell this ledge and all the land east of the canyon, about 15 or 18 acres. I also wish to sell my ranch west of canyon containing about 140 acres, about 9000 bearing vines and 50 fruit trees of different varieties; also berries of different kinds. House, out-building, with cellar well filled with wine, with all implements necessary to care for the wine. Terms, half cash, the balance on time, with seven per cent interest per annum.

LEVY B. BROWN.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco, we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working Gravel, Cement, Clay, etc. It avoids crushing the rocks which are washed clean and at the same time pulverizes the Cement or Clay and SAVES EVEN FLOUR GOLD.

It is only necessary to have about six inches of water to work 100 tons or over per day.

Full particulars given by addressing:

VALLEY SPRING, CALAVERAS CO., CAL., July 19, 1890.

Mr. S. K. SNODGRASS—Dear Sir: We find your machine perfectly reliable for four to five tons per hour, according to size of gravel. The work is well done, and not to exceed five per cent gets by, which I believe is very close work for any machine.

Yours,

L. A. SHEAR.

SAN FRANCISCO, March 25, 1891.
S. K. SNODGRASS, Esq.—Dear Sir: In regard to the work done by your machine, which we have had in operation for the past three months, I can say that it has handled successfully all material as taken out of our ground, the only cement which was not perfectly broken up being an exceedingly hard cemented material approaching rock in its hardness.

For all free wash and moderately hard cement it will do very good work, and must effect a great saving in working such gravels and cements, owing to the small head of water required; and furthermore, its great gold-saving qualities, as I am satisfied that fully 95 to 98 per cent of the gold freed in the machine is saved, even to flour gold, and that too without the use of quicksilver.

The automatic rejection of all rocks and material by the revolving screen makes the handling of the gravel cheaper, as all hand culling of the material is rendered unnecessary. Truly yours,

W. W. B. STEVENS.

Regenerative Coke Ovens.

In proportion to the amount of by-products by condensation from the gases of coking is the inducement to include in plants and practice the saving of such by-products. It has been found that, as in gas distillations, so in the condensation of coke-oven gases, the proper regulation of temperature and pressure permits the formation of a whole series of useful by-products. This system is now employed in ever increasing extent, particularly in Upper Silesia. In a paper read at the Pittsburgh meeting of the American Institute of Mining Engineers, Dr. Herman Wedding of Berlin,

Germany, one of the visiting German iron masters, described condensing works and the ovens.

The ovens shown in the cuts have each a capacity of 5.75 metric tons of dry coal and the coking requires 48 hours. The practice had been introduced at one time, of providing regenerative (see cuts) to be heated by the burned gases (after these, by their combustion, had heated the coke-oven), and to heat or burn the freshly entering gases and the air for their combustion. But it has been demonstrated by the experiments of the well-known constructor of coke-ovens, Dr. Otto of Dahlhausen, that this preheating of the gases may be well

omitted, if the air is sufficiently heated. The resulting oven construction is shown in the other cuts. We shall, next week, describe the condensing apparatus.

Coast Iron.

An article of interest on this subject is given on page 51 of this number of the PRESS. Mr. Weeks, the author, who recently visited this coast, recognizes the fact that while we have plenty of iron, our fuel is not plentiful, and expresses the opinion that our future iron and steel industry will be on Puget Sound, though costs at present are excessive. He thinks that

in California it is out of the question to make pig iron from native ore with anything but charcoal, and that good foreign pig could be bought cheaper than iron made that way in this State.

It is true that the California coals are poor, but there is an abundance on the northern coast and immense quantities come by sea from abroad. Pittsburgh, where Mr. Weeks resides, has no iron of her own, bringing it 1500 miles by rail, yet that city leads in the iron business of this country. We have an abundance of iron ore of specially good quality at various points in California. So it is not beyond the possibility of bringing coal to the iron.

SECTION AND PLAN OF A DOUBLE-BENCH OF COKE OVENS WITH CONDENSERS.

REGENERATIVE COKE-OVENS AT PLUTO MINE.

Mining by Tunnel.

From the first discovery of mineral by the California volunteers, in the early days up to the present time, the business of mining in Mojave county, Arizona, has been carried on under greater disadvantages, perhaps, than in any other portion of the west.

Separated from their base of supplies by hundreds of miles of desert sand, and living in a country where it was impossible to produce anything for their own sustenance, the miners and prospectors of Wallapai district had an apparently hopeless task before them when they commenced the work of exploring and developing the ledges of the Cerbat range, with a view to attracting capital and immigration. Had the surface ores not been of exceptional richness, the country must have been abandoned to the coyotes and Wallapai Indians, but with a determined perseverance, characteristic of the pioneers, they dug and delved, at times poorly clad and half-starved, but never discouraged, awaiting the coming of the day which would bring them the expected reward for all their trials and privations.

The result of their labors may now be seen, after the lapse of nearly a generation, in the hundreds of old dumps and prospect holes, shafts and stopes filled with water, and caved-in, old tumble-down cabins and a few, a very few of the old-timers, bent and grey, but with a steadfast faith in the future of the district, which years of patient endurance have only intensified.

Any one acquainted with the history of mining in Mojave county cannot but be impressed with the belief that her capabilities and mineral resources are worthy of better things. Many of the old shafts now filled with water and abandoned, have produced thousands of dollars, and only need capital to make them once more producers of the precious metals.

The rich surface ores have been worked out years ago, and future dividends must be obtained from below water level by other appliances than a windlass and rawhide bucket. In looking over the mining districts of Mojave county as one knowing from experience its wealth and capabilities, we have been greatly impressed with the possibilities which would result in the development of her mines, could the mountain ranges be pierced by tunnels, as is the case in other mining States and Territories. So far as our knowledge extends, there is not a single prospecting tunnel in the county, yet there are more localities favorable for such undertakings where tunnels for the working and draining of mines could be made to pay a handsome interest on the investment, and at the same time settle the question so often asked by skeptics and croakers, "do the mines go down?"

A year or two ago we had occasion to make a survey of a tunnel site for parties who contemplated organizing a company to drive a tunnel under Stockton Hill. As the company never materialized we will betray no confidence by giving a few facts and figures which may possibly be of interest to the public.

The site selected was at the eastern base of the Cerbat range, at a point near the Cupel wash, and the line of the projected tunnel passed over Stockton Hill crossing at nearly right angles the Cupel, Tiger, Tigress, Prince George, Infatigable and other well known veins. It was found that the Cupel would be cut at a depth of about 800 feet, and the summit of the Cerbat range would be nearly 1200 feet above the tunnel level.

The total length of a tunnel at this point would be a little less than four miles and in this distance more than a hundred ledges would be out which show surface croppings, beside blind ledges covered by debris yet undiscovered.

In order to carry on an undertaking of such magnitude it would be necessary to erect at the eastern end, machinery for driving air compressors, power drills, machine shop for repairs, etc.

At the mouth of Cupel wash there is a beautiful situation for a town, where mills and reduction works could be built for the reduction of ores extracted from ledges out by the tunnel, and water could be obtained by the drainage of the mineral belt sufficient to irrigate thousands of acres of land in the Wallapai valley transforming the grassy plain into gardens, vineyards and orange groves.

Colorado is a State noted for its tunnel enterprises and the writer recalls the "tunnel boom" which swept over the Territory more than 20 years ago, when every mountain side was covered with tunnel sites and every man owned at least a dozen locations. The greater portion of these never passed beyond the first stage of development—a big sign and two sets of timber—but many were driven thousands of feet into the mountains and these same tunnels are to day the main mining enterprises of many localities, and dividend-paying propositions. What has been done in Colorado can be done here in Mohave county. We have mines equally as rich, and incomparable climate and a soil of unsurpassed fertility, it only remains for enterprise and capital to join hands and push the undertaking to a successful termination. Until our mines are worked intelligently and on business principles we cannot expect to be blessed by that material advancement and prosperity which has built up the mining interests of other States and Territories to the proud positions they now occupy as producers of the precious metals.—*Cor. Mohave (A. T.) Miner.*

The New Montgomery District.

George Montgomery, the locator of the mining district which bears his name, on the verge of Death Valley, and the discoverer of what is supposed to be the celebrated Breyfogle mine, has arrived in town direct from the camp. He is accompanied by E. A. Shattuck, the Recorder of the new district, and Mr. Davis, who is interested in some of the more prominent mines.

Mr. Montgomery was in high spirits over some recent mineral discoveries in the vicinity of the Chispa, as his own mine, the first location made in the district, is named, when a Post reporter dropped in at his room. "Everything is doing well down with us," he said, "and much better than any of the members of the original prospecting party could have hoped for. Later arrivals are well pleased with the prospects, and very few have visited the district without either camping there overnight or coming back again as soon as possible.

"The mines on which work is being done are opening up well. The shaft on the Chispa has been sunk 45 feet in the vein, and the ore samples show well all the way down, recent assays from the bottom of the shaft running all the way from \$27 to \$394 to the ton. The hanging wall has not yet been out, but a cross-cut was recently run in to the foot-wall, which was discovered to consist of shale. The other wall is thought to be quartzite, as it appears on the surface croppings.

"The rock is very easy to work, and breaks very fine in bottom of shaft. The new mill is being erected about four miles from the mine, the road being over a grade which rises 1500 feet in three miles. Steam power will be used, plenty of wood being obtainable at \$6.50 per cord. No ore has been crushed as yet, but reserves are accumulating all the time, as all the rock taken out of the seven-foot shaft is pay.

"The Mammoth mine is considered the next in importance, the showing as work progresses being particularly favorable. The shaft at the Yount mine is down 50 feet and the vein at the lowest point is from three to four feet wide. Samples from this property taken by Mr. Hanchette, who was formerly one of the owners of the State Line mine of Nevada, ran over \$800. The high assays led him to believe that the claim had been salted for his benefit, and led him to make the closest possible investigation to confirm the first results. He was rather surprised to find, after spending some time on the property, that his original assays were lower than any obtained in the subsequent critical tests.

"On the 4th of July a new discovery was made by three prospectors close to the main ledge of the district. The ore is a galena, rich in silver and carrying gold. Assays made of samples brought into camp run from \$25 to \$100 in gold and 500 ounces of silver to the ton. The new ledge can be traced for a considerable distance, and it has all been taken up. The varied character of the ores in the district has been a source of great surprise to the mining men who have penetrated the district. Sometimes it is the regular ribbon quartz showing free gold, and again the quartz is stained with iron and copper. The copper stained rock is always found to be rich in gold, and samples pounded in a hand mortar will average over \$1 in gold to the pound. Great boulders are found as float on some of the principal locations literally spattered with gold, and in some places croppings of the same character stand boldly up above the surface for the entire length of a claim.

"The ore veins of the district are turning out much better than expected, widening out and becoming well defined as depth is attained. Only one sale has so far been made in the camp, and that was one out of twelve locations made by a prospector from Modesto. He sold the claim for \$15,000 to some men from Eureka, Nev. As a rule the people who have located on mines are not on the market. They believe in the future of the camp and are satisfied that there is more money to be made in working the ores.

"The district is developing wonderfully. There are now over 60 people residing there, and freighting from Daggett is active. Two stores have been opened, and they are well stocked with everything necessary in a mining camp. The future of the camp is now well assured, and the best proof of the value of the mines is that the miners there, all of whom have been connected with the bonanza camps of Nevada and the West generally, speak in the highest possible terms of the ore development."

CONSOLIDATED VIRGINIA DIVIDENDS.—The Directors of the Con. Cal. and Virginia Mining Company have declared a dividend (No. 35) of 50 cents per share, aggregating \$108,000. The last dividend declared was on April 10, 1890, of 25 cents. The total amount disbursed in dividends by the Con. Cal. and Virginia up to date foots up \$3,462,000. Opinion is divided among local operators as to the continuance of the dividends, but the general opinion is that before the ice forms in the Carson river, Con. Cal. and Virginia will have paid six dividends this year, two or three of which may be 25-cent dividends. The prospects of the mine are really good for the payment of six 50-cent dividends. The ore in sight would seem to warrant this statement. In the neighborhood of the 1700 and 1750 levels a very good body of ore is being opened out. The 1600 and 1500

levels, and the stopes above them, are yielding well, and no work whatever has been done above the 1100 level and north of the point where they are at present stopping out ore. The immediate future of the mine and its best prospects are in this direction. This includes the territory from the south line to the north end, beginning at the 1300 level, clear to the croppings, which lie on the side of the hill far to the west. Steam will not be shut off until this big block of rich mineral-bearing ground is cut up into 50-foot cubes.—*Virginia Enter.*

Production of Lead.

The Rocky mountain region is the great lead-producing area of the United States, and Colorado is far ahead of the other States. The cost of smelting has been greatly lowered, having apparently been in 1889 \$6.97 per ton of material treated, without allowance, however, for loss of base or precious metals. A census bulletin on the subject says: "The most striking fact illustrative of the great progress made in lead-smelting is the enormous quantity of ore treated when compared with the relatively small amount of lead produced—in other words, the small quantity of the base metal in the furnace mixture. It proves what progress has been made in smelting. Where it is possible to add to what may be termed lead ore proper such quantities of strictly argentiferous or dry ore, the average percentage of lead in the mixtures was between 11 and 11.5. The exact amount cannot be stated in the absence of any data on the silver contents of the base bullion. A decade since, such results would have been unattainable without heavy losses, both in the base and precious metals."

Special interest is attached to the operations of smelting establishments near the Mexican border in Texas and New Mexico. One of them, however, did not begin operations until the close of the census year. The number of establishments was three, and the product of bullion was 13,733 short tons, and the quantity of ore treated was 79,168 short tons.

The product of the great lead-producing regions in the census year is given as follows:

State.	Tons.	Amount.
Arizona.....	3,158	\$98,747 84
California.....	53	1,999 65
Colorado.....	70,788	2,101,014 31
Idaho.....	23,172	1,042,629 31
Montana.....	10,183	456,975 40
Nevada.....	1,094	72,653 64
New Mexico.....	4,764	170,754 59
South Dakota.....	116	4,653 44
Utah.....	16,675	763,329 09
Total.....	130,903	\$4,712,767 27

The State of Missouri, during the same time, produced 44,482 tons. The lead production of Colorado, and its value during the census year, was very heavy. The most productive of the counties was Lake, with 100,953,862 pounds, valued at \$1,448,643; Pitkin county follows with 14,263,832 pounds, and Chaffee county with 3,078,247 pounds.

One group of smelters, says the bulletin, the operators of which it is possible to segregate without risk of obscuring the results by the introduction of figures, which should be assigned to allied branches of the industry, are the Colorado smelters, the aggregate embracing the reports from nine plants, the product of base bullion being 67,867 short tons, and the quantity of ore treated 602,014 short tons. It is shown that there are 1929 employees in the lead smelters in Colorado, of which 1818 are laborers, 62 mechanics, 47 foremen and 2 boys. The laborers on an average receive \$2.52 per day, the mechanics \$3.57, and the foremen \$4.17. The total disbursements, exclusive of the value of ore, is stated to be \$4,196,405.10, as follows: Total wages, \$1,645,819.46; salaries, \$206,606.81; paid contractors, \$45,998.03; value of supplies and material consumed, \$1,774,340.92; rent, tax and miscellaneous expenses, \$523,639.88.

PUMPING ON THE COMSTOCK.—The Virginia Enterprise says: John W. Mackay is on the Comstock. When last upon this coast very favorable reports appeared in print with regard to the prospect for the resumption of deep mining upon this lode, Mr. Mackay was represented to be a warm advocate of the measure; Sam and Senator Jones were in it; H. M. Levy and friends were all right; certain minutiae was simply to be arranged, and work was to begin. The Enterprise does not believe the above reports were given the free flow of newspaperial wind simply to walk stoops on high. It believes that the gentlemen in control in all sincerity entered into arrangements to pump water, and it hopes that during Mr. Mackay's presence on the coast, arrangements will be completed whereby all the mining companies on the lode will enter into a powerful and harmonious combine to drain the mines to the 3000 level at least. Money can be raised for this purpose. More money can be got for pumping water than can be had for circulating around porphyry flats. Besides the prospects are inviting. The Combination shaft quit on the 3300 level in as favorable a formation as the Chollar croppings show. A strong body of fair-grade ore was struck on the 2700 level of Belcher. On the 2200 level of Eschschlager there is another good body of ore. There is still another promising body of ore on the 1900 level of Con. Cal. & Va. From the 2200 level of Chollar and Potosi downward there is as promising a quartz formation as was ever seen on the lode. An immense amount of work has already been done; shafts have been opened; there is plenty of machinery on the lode; let us pump.

The Late Edward Burgess.

The most noted naval designer of the day, Edward Burgess, died at his home in Boston July 13. He was known as the most successful yacht designer of the century, and one who devised new forms which excelled all those previously built. Mr. Burgess was a native of Boston and a graduate of Harvard, where he afterward served as instructor in entomology. For 15 years he was Secretary of the Society of Natural History in Boston. Mathematics had been a favorite pursuit, and as a recreation he began to apply his mathematical conclusions to naval architecture.

A few years ago, when the English yachts challenged America in a race for the America's cup, Mr. Burgess designed the yacht *Pariten*, which successfully defended the cup. The following year he built the *Mayflower*, which again won the international race. The third year he built the *Volunteer*, which for the third time beat the piked English craft and took the laurels for our country. Mr. Burgess has designed many other yachts and trading and fishing vessels, all of which showed remarkable speed. Some time since, he abandoned all other work for that of naval designing, which brought him fame and fortune. He was 43 years old at the time of his death. The genius of this man has brought about a marked advance in the science of naval designing, the influence of which will be felt for many years.

The funeral of the late Edward Burgess took place at Trinity Church, Rev. Dr. Phillips Brooke officiating. The pall-bearers were: General Charles Paine, Mr. Allerton, William Tucker, Henry S. Hovey, Amory A. Lawrence, Franklin Dexter, Dr. John Bryant, J. Malcolm Forbes and Dr. W. F. Whitney. There was also a notable gathering of prominent yachtmen and leading citizens. Fleet Captain Peabody represented Commodore Gerry of the New York Yacht Club and ex-Commodore S. Nicholson Kene; Secretary J. V. S. Oddie, Commodore L. D. Morgan and Superintendent Niele Olsen came from New York to attend the funeral. All the ex-Commodores of the Eastern yacht clubs, and also the Commodores and flag officers of the local yacht clubs, and delegations representing the Seawanhaka and Larchmont yacht clubs were present. Letters and telegrams expressing sympathy with the widow of the deceased in her bereavement were received from all parts of the country.

Edison Incandescent Lamps.

Advices from New York, dated July 14, are to the following effect:

In a suit of the Edison Electric Light Co. against the United States Electric Light Co., for an infringement on a patent for incandescent lights, Judge Wallace to-day rendered a decision in favor of Edison.

The decision broadly, squarely and fully sustains the Edison patent. Judge Wallace also orders an injunction against the defendant and an accounting of the profits for past manufacture. The present output of incandescent lamps in this country is about 50,000 a day, only half of which are now made by the Edison company. That company asserts that the decision gives it a monopoly. The patent was sustained by two appellate courts in England, and the decision of Judge Wallace apparently agrees with the English decisions. It is thought the Thompson-Houston and Westinghouse companies will continue their business much as before. The patent has only two or three years more to run. The United States company, against whom the decision was rendered, proposes to appeal at once.

"Mr. Edison's invention," said Mr. Eaton of Eaton & Lonia, his counsel, "was made in 1879, and the patent was granted in 1880. This suit was commenced in 1885 and is one of the most important of a series of suits for many years prosecuted by Edison's company to establish Mr. Edison's priority. The other suits, one system on the distribution of the electric current for electric lighting, another on what is known as the three-wire or economical system of circulating current, and the third subdivision current, are ready for court and will be argued in the autumn. The Edison company, however, claims that this present decision is so broad and controlling as to render the commercial value of the other decision, even if made in their favor, as of second importance."

"THE MINERS' BEST FRIEND."—The MINING AND SCIENTIFIC PRESS of San Francisco has just completed its sixty-second volume. Having known it since its birth, having read it carefully since then, we can safely affirm that it is and has been the miners' best friend and educator. Over 20 years ago, when we were begging the Federal Government to "stop the war," here, the old MINING AND SCIENTIFIC PRESS stood with us, and Crook, who "broke the backbone of the Indian war," was sent us.—*Prescott Courier.*

EDISON is a new town in Washington, where the shops of the Northern Pacific Railroad Co. are being put up. Fourteen buildings comprise the present structures, and the yards cover 60 acres. The buildings are done and the machinery is being put in. When everything is done the expenditure of money will exceed \$1,000,000 and 2000 men will be employed before the end of the first year.

The Precipitation of Metals from Hyposulphite Solutions.

(Read by C. A. SYKES, JR., of San Francisco, before the American Institute of Mining Engineers.)

Metallurgical processes cannot be conducted successfully without the aid of analytical chemistry. The great perfection of lead smelting in the West, for instance, has only been accomplished by the analysis of ores, fluxes, slags, and all products of the furnace. Ores are mixed and fluxed to obtain a slag of desired composition. Account is even taken of the composition of the ashes obtained from the coke. The "muscular" smelter has left the field forever! This state of affairs has been induced by sharp competition, i. e., by a complete separation of the industries of mining and reducing ores, not by the liberality and wisdom of directors and stockholders to provide laboratories and engage chemists, or by their love for scientific investigation.

It would be considered absurd, at present, to run a lead smelter, a blast furnace for pig iron, or a Bessemer plant, without the assistance of a well-equipped laboratory and a chemist, but it is considered quite sufficient to provide amalgamation or lixiviation works merely with a crude assay office, and an assayer who is paid less than a laborer in the mill.

In my opinion, this will change in the near future. By the exclusion of Mexican lead ores, and their growing scarcity in the West, smelters have been forced to raise their charges on so-called dry silver ores, and cannot handle the latter now in such unlimited quantities as formerly. The inevitable result must be that the surplus of these dry silver ores, especially those of low grade, will be reduced by processes cheaper than smelting, and here the introduction of lixiviation has an excellent field, provided the muscular lixiviator has an able chemist for an assistant.

It is to be regretted that so little analytical work has been done in lixiviation. We know almost nothing of the composition of roasted ores before and after lixiviation; of the constitution of the first wash-water and of lixiviation solutions after prolonged use; of the chemistry of sodium and calcium sulphides; of the composition of sulphides and carbonate precipitates. Without such work material progress is not possible.

Errors Repeated.

During the last seven years a great number of papers on lixiviation have been published, containing a good deal of valuable information, but also many errors due to hasty and incomplete investigation without thorough analytical work. Writers of metallurgical treatises, myself included, have repeated these errors like parrots—what else could they do? I will point out a few. We find it almost everywhere stated that in boiling caustic milk of lime with sulphur the lower osmium polysulphides cannot be produced, because they are insoluble. This is not correct. CaS cannot be obtained in the wet way or in solution. If it is made by heating CaCO_3 in fumes of CS_2 and CO_2 , and brought in contact with water, CaH_2O_2 and CaH_2S_2 are formed, the latter being readily dissolved. According to the best authorities, CaS and Ca_2S do not seem to exist at all, at least not in aqueous solution. If caustic lime is boiled with sulphur, the tendency prevails to form CaS , even if an excess of lime is present, not because CaS_2 and CaS_3 are insoluble compounds, but because calcium has stronger affinities to unite with four equivalents of sulphur.

A more serious error occurs in Daggett's paper, *Trans.*, xvi., 423, in regard to the abnormally high precipitating coefficients of sodium sulphide prepared according to Russell's directions. Believing in the correctness of Russell's experiments, I built upon them an elaborate theory in my book on the *Lixiviation of Silver Ores with Hyposulphite Solutions*. Aaron was the first who proved that these abnormal precipitating coefficients exist only in partial precipitation, which Russell has entirely overlooked; hence they have no existence in practical mill-work. That Aaron's results are correct I know from personal observation. In the following I have to record another important error. In Daggett's paper, already quoted, we find on page 430 that calcium monosulphide is precipitated by Russell's sodium sulphide if the hyposulphite solution contains calcium salts. The yellow precipitate of calcium sulphide is said to appear after nearly all the silver, copper and lead have fallen out. I have no doubt the precipitate occurs, and looks yellow, but it is not CaS , or CaS_2 , or any other calcium sulphide. Like all other faithful writers of books, I have also endorsed this statement in my treatise on lixiviation.

The Metals Playing an Important Part

In precipitation from hyposulphite solutions, resulting from the lixiviation of silver ores, are silver, copper, lead and calcium. The quantity of gold that may be present is too small to enter into calculation. Silver and copper are always precipitated as sulphides by sodium or calcium sulphide; lead and calcium may be precipitated as carbonates by Solvay soda; or lead alone as hydroxide by caustic lime. Sodium sulphide can be used either as a mixture of Na_2S and Na_2S_2 , which we will designate in future as "Russell's Sulphide," or Na_2S_3 , or a higher polysulphide. Calcium sulphide is always used as CaS_2 . For precipitat-

ing lead, caustic milk of lime is prepared with hyposulphite stock solution. Solvay soda is also dissolved in stock solution.

Calcium may also be precipitated by a sodium sulphide solution, as will be fully discussed later on. Caustic lime and Solvay soda are always used before calcium or sodium sulphide.

In the absence of calcium, the lead carbonate precipitated by Solvay soda can be obtained practically free from silver; that is to say, after washing it with fresh hyposulphite solution. From Ontario ore, for instance, Russell obtained in this way lead carbonate with only two ounces of silver per ton. If calcium is present, the lead-calcium carbonate contains more or less silver, and may be very rich. According to Wilson and Russell, the silver does not increase in proportion to the calcium precipitated. Russell also claims that washing the precipitate with pure or more concentrated hyposulphite solution will reduce its value in silver considerably.

This is not clearly established. At the Marsac mill, one lot of carbonates was recently produced containing 8.1 per cent lead, and 392 ounces silver per ton; and another lot containing 19 per cent lead, and 1269 ounces silver per ton. I do not know the exact circumstances under which these carbonates were obtained. Evidently, this subject, like so many others in lixiviation, needs a thorough analytical investigation.

Lead hydroxide precipitated by caustic lime is generally rich in silver. According to Rueger, the lead precipitate obtained at the Mount Corry mill, Nevada, contained 60 per cent lead and 420 ounces and more of silver per ton.

The separate precipitation of lead and calcium may be not only economical directly, but also indirectly by the production of silver sulphides of higher grade.

Since the introduction, by Kiss, of CaS_2 as precipitant, the majority of metallurgists have tenaciously adhered to this practice, evidently without examining the subject critically. The question has become more complicated by the recent introduction of methods for separate precipitation of lead, and of the Russell process. It is hardly necessary to add that the problem also includes the question whether a sodium or calcium hyposulphite solution deserves preference in lixiviation.

Although lixiviation is now always commenced with sodium hyposulphite, this salt is gradually replaced by calcium hyposulphite if CaS_2 is used as precipitant.

In the following I propose to present in a systematic manner the most important facts that have a practical bearing upon the subject of precipitation. The reader, however, should not expect a complete and exhaustive treatise, for which analytical data are entirely lacking.

1. Preparation of Sodium and Calcium Sulphides.

Both reagents are prepared by boiling either a concentrated lye of caustic soda, or caustic milk of lime with sulphur. In making calcium sulphide, sufficient sulphur must be added to the caustic lime to obtain CaS_2 , because lower calcium sulphides are not formed. In fact, the solution contains CaS_2 , even if an excess of lime is present, while an excess of sulphur produces CaS_3 . From the slight solubility of calcium hydrate in water, it follows that this process must require considerable time, and that at the end of the operation, a solution of only moderate concentration must result. From sodium hydrate, on the contrary, a lye of almost any concentration can be obtained, as well as sodium monosulphide, and all of the polysulphides. Hence, the process must be completed very rapidly, and, if the lower polysulphides are desired, with a minimum consumption of sulphur.

The mode of preparing calcium sulphide is well known. I will only call attention to the facts that it is troublesome, wasteful in chemicals, amount of steam and time consumed, and that an excess of sulphur should be used to obtain CaS_2 .

Russell discovered a practical and easy method of preparing sodium sulphide. According to his directions, the contents of a drum of caustic soda are broken into lumps and dissolved with the aid of steam in a minimum of water, thus forming a very concentrated lye. The operation is conducted in a cast-iron tank three feet diameter and seven feet high. When the lye has reached a temperature of not less than 100°C , sulphur is gradually added, two-thirds of the weight of the caustic soda. A most violent reaction takes place, the mass foaming considerably. This, however, is caused by disengagement of steam, and not of any other gas. After all the sulphur has disappeared, the product is allowed to cool, dissolved by adding hyposulphite stock solution, and discharged into a storage-tank, where the solution can be diluted still further. In two hours, 700 pounds caustic soda, the contents of one drum, can be easily converted into sodium sulphide. The solution contains a mixture of Na_2S and Na_2S_2 .

The quantity of sulphur used for making Russell's sulphide is somewhat empirical. The two-thirds rule may be very convenient for the laborer; but metallurgy has not been invented for his convenience. As will be seen at once, the rule does not at all consider different grades of caustic soda, which may contain from 85 to 95 per cent NaHO , thus producing sodium sulphide differing materially in composition. If we use sulphur with 95 per cent NaS , and caustic soda with 95 per cent NaHO , the resulting

sulphide will be $\text{Na}_2\text{S} + \text{Na}_2\text{S}_2$. If, however, the caustic soda contains only 85 per cent NaHO , the sulphide will have very nearly the composition $\text{Na}_2\text{S} + 4\text{Na}_2\text{S}_2$.

This subject will be further discussed in the following paragraphs.

(To be Continued.)

Iron on the Pacific Coast.

The American Manufacturer and Iron World of Pittsburg appears this week in a new and more convenient form, decidedly improved in appearance. The editor, Mr. Joseph D. Weeks, visited this coast last month on a tour of investigation among the iron and coal miner. In the last issue of his paper is published the following editorial:

The articles published in our Iron Ore Department this week on the discovery of a Bessemer ore in Southern California brings up the whole subject of the manufacture of iron and steel on the Pacific Coast. At present, the production of iron and steel west of the Rockies is confined to the output of a single charcoal blast furnace at Oswego, near Portland, Oregon, producing about 40 tons a day, and to the four rolling-mills in and near San Francisco, Cal., producing not to exceed 50,000 tons of iron and steel a year. There is a blast furnace at Ironside in Washington on Puget Sound, but it has been idle now for 18 months, while the California charcoal furnace that last made iron in 1886 has been abandoned. A furnace is under construction at Kittland, Wash., near Seattle, the stock bins and the auxiliary buildings of which were up and the excavations for the foundations of which were nearly finished in May of this year.

The difficulty in the way of the development of the iron and steel industry of the Pacific Coast at least up to the point of supplying its own demand has been fuel. California has no mineral fuel that can be used at all in the manufacture of pig iron and such deposits of iron ore of a good grade as it possesses are at present so located with reference to fuel that can be brought in from abroad or from other States as to put out of the question at present the manufacture of pig iron from native ore with anything but charcoal and it is probable that the cost of charcoal iron laid down at San Francisco which is the chief point of consumption would be much above the price at which good foreign pig iron could be bought.

The mills of San Francisco depend almost entirely upon anthracite coal. This costs the mills from \$7 to \$8 a ton laid down at the works and though Washington coal can be laid down at a lower figure it is regarded as more economical to buy the anthracite coal.

With coal at these figures and pig at \$26 a ton it will be seen that the iron and steel works of California are heavily handicapped from the start, and yet there are mills at San Francisco which in spite of all drawbacks have a record of which to boast.

But it is not in California but in Washington that the "Future Situs" of the iron and steel industry of the Pacific Coast is to be located. Oregon on the seaboard has some coal, but it is on Puget Sound in Washington that the best coal in greatest abundance is to be found.

The coal all through this section is cretaceous, a much younger formation than the carboniferous of Pennsylvania. It was all originally lignite, and even now most of the deposits are of this grade. In some places, however, notably near Wilkeson, the action of the heavy covering in freeing the Pennsylvania and other Eastern coals of the excessive water and volatile matter and making them true bituminous coals has been supplied by the heat of the pressure and firebricks, and the lignite has changed to a good bituminous and coking coal. A very good coke is made from this Wilkeson and similar seams, while there is an abundance of coal not coking that can be used readily in heating, and especially in iron and steel manufacture where producer gas can be used.

In the neighborhood of this coal good iron ores are found. The magnetic ores of the Cascade range are somewhat similar to those of Cranberry, N. C., and there is no doubt but that iron ore of a good quality and in large quantities exists not far from the coals near Seattle. Magnetite from Mt. Logan shows (average of five analyses) 69.26 iron, 1.96 silica, .03 phosphorus. The iron and steel works now in course of erection at Kirkland will use ores of this grade.

It is on Puget sound that the iron and steel industry of the Pacific Coast must be located. Far-seeing business men are realizing this. The Kirkland iron and steel works, the wire-nail mill that is in course of construction, the iron ship-yard that is being built, are all evidences of this. And Puget Sound is not only to make iron and steel for the Pacific Coast, but for much of that vast horde of people who get their supplies over the Pacific ocean. Costs at present are excessive, but these will be reduced. Coke cannot always be sold at \$7 to \$12.50 a ton, but when the abnormal labor and speculative conditions that now exist become normal, then Puget Sound will take its rightful position as a great iron and steel producer.

Bessemer Iron Ore in California.

The following is the article alluded to in the first part of the editorial:

A correspondent of the *Bulletin* of the American Iron and Steel Association describes in that journal a deposit of magnetic iron ore sit-

uated in California about 150 miles east of Los Angeles, and 12 miles off the Atlantic & Pacific railroad. He describes the ore as lying in a well-defined contact vein between walls of granite and syenite, and is from 400 to 600 feet in width by 3000 feet in length, and apparently of great depth. In places along the hills through which the vein runs it rises to nearly 100 feet above the surrounding rock. The ore is quite accessible and can be mined at very little expense. As shown by analyses, the ore is very pure. The determination by leading chemists of this country of the objective contents is as follows:

	Per cent.
Iron.....	68.84
Manganese.....	0.088
Phosphorus.....	trace.
Sulphur.....	0.078
Titanium.....	0.20

"The silica runs below two per cent and titanium a trace."

"A Pittsburg engineer, posted on the cost of fuel, etc., places the expense of producing a ton of pig iron at a point in California convenient to this iron ore deposit at \$13.75 per ton, on the basis of ore carrying 50 per cent of metallic iron. The property does not produce any ore running under 60 per cent of metallic iron. Charcoal would be the fuel to be used, and it is available in sufficient quantity."

"The present consumption of pig iron in California would absorb the output of a blast furnace producing 100 tons of iron daily, and the prices now paid in that State for pig iron, varying from common coke to charcoal iron, range from \$26 to \$35 per ton, which prices would admit of a clear net profit of from \$8 to \$17 per ton."

"There is no other such body of ore, having the dual qualifications of purity and quantity in the Far West, and no other which could compete with this were it developed."

The *Manufacturer* adds: While the analyses show a remarkably pure and good iron ore, it is hardly correct to say that there "is no other such body of ore" in the Far West. The Shasta iron ore in the same State is fully as good for all practical purposes as this (Southern California) ore. The mammoth vein of Gunnison, Col. ore is also as pure an ore.

The difficulty in making pig iron in California is lack of fuel and the great cost of transportation to the seaboard where it is consumed. This pig iron, which it is claimed can be made for \$13.75, is some 700 miles from San Francisco on railroads that would charge say 2 cents a ton a mile or \$14 freight. This would make the cost at San Francisco, the chief point of consumption, even if the pig could be made at \$13.75, at least \$27.75, while a good grade of Bessemer pig can be bought at San Francisco for \$26. The consumption of pig at points nearer Los Angeles would hardly justify the erection of a 100-ton or even a 50-ton furnace.

What is Forestry?

The U. S. Department of Agriculture will presently issue through the Forestry Division a 50-page bulletin (No. 5), entitled "What is Forestry," a compilation and enlargement of several addresses on this subject delivered by Prof. B. E. Fernow, Chief of the Forestry Division.

It treats the subject in three chapters. The first presents briefly the important part which our forest resources play in the national economy. The second shows the principles which underlie a rational system of forest management in a wooded country, giving especially and in sufficient technical detail the considerations involved in the practice of "timbering." The third part treats of forest planting in the treeless country, discussing the rationale of forest planting in so far as it differs from mere tree-planting, and giving in detail rules for the selection of various kinds of trees in "mixed" planting. Two letters from tree planters on the Dakota plains, giving the results of actual experience with the methods commonly pursued, form an interesting appendix.

The bulletin is designed to present the question of forestry plainly, divested of the scientific terms which must necessarily accompany a technical discussion, and to serve not only for the information of the owner of timber lands, of the farmer whose farm contains a certain area of woodland requiring intelligent treatment or who desires to devote a portion of his farm to timber, and to the settler on the Western plains, but to the citizen with whom forestry and the management of our forest resources is simply an important economic question. In view of its general character, a large edition of this bulletin will be published. Copies are to be had on application to the Secretary of Agriculture, Washington, D. C.

For the coming Fair of the Mechanics' Institute in this city, a new plan for the arrangement of exhibits has been approved. It gives greater free space in the center of the Pavilion to accommodate those who wish to be near the music. As music is to be one of the most prominent features, the space allowed will provide for the accommodation of very many more people than at previous exhibitions. Nearly all the available space for exhibits is now exhausted, and those who desire to secure places are requested to make application at once.

The required subsidy of \$15,000 having been raised, the motive power of the road from Los Angeles to Vernon, about three miles in length, will be changed from horses to electricity.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BELMONT MINE.—Amador Ledger, July 18: The superintendent, J. H. Tibbits, reports: Tunnel No. 1 is now in 260 feet. The ten-stamp mill is running nicely and doing good work. Stopes above tunnel level are looking well and yielding the usual amount of ore.

MISCELLANEOUS.—At the Clinton Consolidated they have just completed the burning of a kiln of brick, which is to be used in the building of chlorination works. At the Bellwether claim near Jackson they are still drifting both north and east. They have run about 70 feet without cutting the ledge.

FROM SUTTER CREEK.—The laying of the pipe at the South Eureka will commence in a short time. It is nearly all on the ground ready for laying, but owing to the extreme heat the pipe is so hot that they cannot handle it. They are making good headway with the hoist, and as soon as the pipe is in position everything will probably be ready for turning the water on, when sinking will be greatly facilitated.

MORE RICH ROCK.—Dispatch, July 18: Another lot of very rich rock was taken out of the mine owned by Mello, Questor and others at the Jackson Gate a few days ago, which makes even a better showing than any that has heretofore been taken out. They have already developed the ledge to the width of about 35 feet, and have taken out several tons of rock which they will soon have crushed in order to get a fair average test of the richness of the ore from different parts of the ledge.

Mono.

THE LAKEVIEW MINE.—Bridgeport Chronicle-Union, July 15: On Tuesday evening we had the pleasure of a short interview with Chas. A. Dyer of Calais, Me., one of the owners of the Lakeview mine at Lundy, in the Homer mining district, who is here in the interest of the company, which is composed of Calais and Portland, Me., capitalists. The company has purchased the Spaulding mill at Bodie—a 10-stamper, which is being removed to Lundy, where it will be erected and made a first-class plant. A tramway will be built from the mine to the mill for the transportation of the ore, which can be dumped into the mill at a trifling cost per ton, and as the mill will be run by water-power it goes without saying that the cost of working the Lakeview ores will be extremely light, enabling the company to run all its ore through the mill without the expense of sorting it. The Lakeview is rich in gold, and the mine will be worked systematically, as a good mine should be, and not on the "gnuge-eye" plan, as many of the mines in this county have been worked. R. T. Pierce, the superintendent, is well known throughout the county as a thorough miner and good business man, and his energy and management have brought the Lakeview to the front. Mr. Dyer will remain about three months, and after spending the winter at home he intends to return next spring. He is highly elated over the developments already made in the mine.

THE DUNDERBURG MINE.—The work of repairing and cleaning the Dunderburg tunnel is being pushed by Supt. Purdy, who has retimbered the entrance, many of the old timbers having caved in after these many years. The tunnel will be cleaned out next week, and several tons of average ore will be taken out for a mill test. When this mine was first opened, some 20 years ago, quartz mining was in its infancy and the processes for working ores were not as efficient as at this time, and refractory ores could not be worked at a profit, and the ores from this mine were of this class. Now there is nothing to prevent the working of the Dunderburg ore, and we are confident the result of the coming test will be satisfactory to the intending purchasers, an English syndicate. The tunnel is in over 700 feet, and drifts were run north and south on the front ledge, the back one not having been prospected thoroughly. There is a large amount of good ore on the dump which will pay to work. This mine is well situated for economical working, water-power and timber being close at hand. The surroundings are pleasant and there is a good townsite adjacent. The mine is about six miles from Bridgeport, on an air line, but by the wagon-road it is farther.

NOTES.—Much work is being done in the Patterson district. The Rattler continues to show good ore. There is a good prospect of the Kentuck. Great Western and one or two other mines are being sold to strong companies. The work in the combination shaft and tunnel of the Goleta, Montecito and Sterling claims, Jordan district, is progressing finely, and will bring that district to the front. In the Homer district, aside from the Lakeview, a great deal of substantial work is being done. A few days ago a \$5000 shipment of bullion was made from the district, the result of the working of a small lot of Lakeview ore. Now that Homer district has dropped the London incubus, it will forge ahead and soon become an active agent in the monetary world. The Standard Con., at Bodie, is making monthly shipments of \$25,000. There is nothing new to report of the other Bodie mines which are being steadily worked. The Bentonians are quietly working their mines, shipping their ores to the reduction works, receiving their bullion and spending it as their needs and pleasures incline them. Taking the county as a whole, its mining prospects are brighter than they have been for many years, and another year will see us with a greater assessment roll and a lower rate of taxation—evidence of prosperity and thrift.

Napa.

KNOXVILLE.—Cor. Napa Register, July 17: The Knoxville mine, which has been in a comatose state for several years, is in a fair way of coming around again. Anton McMillan, the present owner, is doing wonders with the limited capital at his disposal. He has completely abandoned working from the old works (the shaft of which was down over 600 feet), and started on new ground and sunk a shaft, now down over 200 feet. Jim Raphael, the underground foreman, has drifted 175 feet south-west from the boom level and run two crosscuts from end of same level 60 feet northwest and 75 feet south-west. Just now they are getting out some rich ore

in both the cuts, and they know it is good for 30 feet ahead, as Jim has prospected that distance. The cinnabar is just as rich as that the old company were getting the last seven years of their running, and they averaged 200 flasks per month for that time. In their best days they have between 400 and 500 men on their pay roll, and their monthly output ranges from 600 to 1000 flasks per month, and the dividends of one year amounted to \$450,000. But in those days things were run at high pressure. They extracted everything in sight. Prospecting was not pushed as it ought to have been. It was either a feast of metal rock or a famine, and then there was a shut-down of the furnaces till a new supply was found. And then the final collapse of the big concern came. 'Twas a pity, as there were generally about 40 families employed by the company. At present there are about 30 men employed in the Knoxville mine. About one and one-half miles northwest is the Manhattan. It has been running 25 years. Knox & Osborne are its owners. They invented the modernized furnaces now in use all over this State. They employ about 30 men.

Placer.

IOWA HILL PETITIONERS.—Placer Herald, July 18: A committee of citizens from Iowa Hill, consisting of S. M. Sprague, M. R. Gleason, J. F. Brown and others, waited on the supervisors of Sacramento county this week with a strong petition asking that no injunction be laid against the miners of Iowa Hill that would prevent them from working the lower or heavy gravel strata of their mines the debris from which never reaches the American river, or that would interfere with drifting. The committee of miners, which even the Bee had to admit were a fine lot of well behaved gentlemen, represented that such work as they desired to prosecute could be performed without injury to Sacramento or the valley in the least, and they asked that the board visit the locality and satisfy themselves of the truth of these representations before permitting an injunction that would necessarily ruin the mining industry at Iowa Hill entirely. Though Chairman Greer, of the board, opposed making the trip to the Hill, and argued in favor of hitting the miners as hard as he could, showing no more feeling for his fellow men in this case than as though the miner was a Hottentot and he was a king, yet the majority of the board manifested more reason and decided finally to visit the mines at a date to be hereafter selected. This effort of the Iowa Hill Committee deserves praise, for anything that brings the contending factions nearer together and leads to a better understanding of the situation must result in a modification of the unnecessarily bitter feeling which is the cause of much of the present difficulty, and which stands in the way of any reasonable suggestion for a practical solution of the trouble. It seems an later information that an injunction has already been laid against the mines of Iowa Hill which is extreme in its provisions, and the committee ask to have it modified to an extent that will allow them to mine where no injury will result. Every element of humanity and justice demands that their petition be granted.

Plumas.

CLEANUP.—Plumas National, July 18: Eyraud & Co. who are mining at Indian Hill, on the East Branch, will make a nice cleanup we are informed. Owing to difficulties contended with this season, they were unable to keep steadily at work, but nevertheless the yield from their mine will be in the neighborhood of \$3000. And still some say the mines of Plumas county are played out. On the contrary Plumas is yet in her infancy, so far as mining is concerned. The machinery for the mill at the old Jackson quartz ledge is all on the ground, and is now being put up, and the mill will be in operation by the first of August. The owners, Sutton, Orr, and others, have lots of faith in this mine, and with reason, too, for a good prospect can be got anywhere on the ledge, and say before many weeks they will surprise the quartz miners of Plumas with rich developments.

AT THE DEERY MINE, situated near Greenville, we are told that for ten days' run from 15 stamps, \$4000 was cleaned up a short time ago. This mine is owned by Standart & McGill, and is one of the many good paying mines in that section. We hope the lucky owners will continue to take out the gold by the pound.

AT THE GREEN MOUNTAIN mine near Crescent Mills in Indian Valley, everything is moving along in good shape, under the supervision of G. P. Cornell. The tunnels have been opened up for quite a distance, and a ditch for the new pipe to be laid from the Round Valley reservoir has been dug, flumes and pipes repaired, and it will not be long before the mill will be ready to start up. About 40 men are now employed at this mine. This in connection with the Crescent mine, makes Crescent Mills one of the liveliest mining camps in Plumas. Among the pleasant sights noted by a Mercury reporter early this morning was the passage along Myers street of heavily laden teams, conveying the machinery for a ten-stamp quartz mill, to be erected on a mine in Plumas county; owned by Captain J. W. Smith of Oakland. The mine is known as the Buck Whiting mine, and is located at Rich Bar. The mill reached Oroville, consigned to H. C. Bell & Co. forwarding merchants.—Oroville Mercury.

The machinery mentioned in the above is for the Shenandoah mine at French Ravine, and owned by an Oakland Co. Capt. J. W. Smith has taken a contract to put the mill up and has already a wagon road about completed for the purpose of hauling the machinery to the mine. Mr. Charles Mather a native of Plumas county, whose father now lives in Oakland, and who owns stock in the above mine, was recently appointed superintendent of the mine, and will commence taking out quartz next week.

San Bernardino.

MORONGO DISTRICT.—Riverside Press and Horticulturalist, July 18: The Rose mine in the Morongo district has been purchased by D. A. Wheeler & Co. for \$30,000 cash. This is the rich mine we mentioned a few days ago as running \$400 to the ton. **GAVALAN MINES LEASED.**—Col. E. N. Robinson of the Cajalco tin mines was in San Diego the other day, with some fine specimens of tin ore. As we learn from the Union, the rock was taken from a new winze or shaft 16 feet below the old workings. Development, it is understood, is resulting satisfactorily at the Cajalco camp; everything is progressing smoothly, but little work is being done at the lower dam. The San Jacinto estate has leased about 6000 acres of mineral land to a Chicago syndicate

for a term of ten years. The lease includes the old Gavilan gold mines. The company receives a stipulated nominal sum annually and 20 per cent of the gross output of the mines. The Gavilan mines in former years paid well, even though arastras and a small stamp mill some miles distant were the only means used in crushing the quartz. The remains of the 30 or more old arastras are still to be seen about the mines.

Sierra.

CHINESE BONDS.—Mt. Messenger, July 18: A company of Chinese has bonded the roof gravel mine, located east of Sierra City for a period of five years, and will proceed to open and prospect the same. This mine has not been worked for several years, those who opened and prospected it never having been able to find the pay channel. The theory upon which the original prospectors proceeded was that the channel upon which the B. M. Ex. Co. is now working, came down from the vicinity of Gold Lake, and that they had a portion of it. Whether this be the true theory or not, has not yet been proven.

PROSPECTING FOR GRAVEL.—A Larabee and Eddie Owens are at work prospecting an island in the river about two miles below Goodyear Bar. They are after a bed of gravel which underlies a body of pipeclay. The early miners worked down to the clay and thinking it was a kind of bedrock, went no further. An unworked portion of the river bed is supposed to underlie the pipeclay. The question is, how came this large body of pipeclay in the bed of the river? Where did it come from? Did it come from some Pliocene channel which crossed the country at an altitude of 2000 feet above its present resting place? If so, what preserved it for the vast lapse of time which was required to erode the canyon of the Yuba to its present depth.

GOLD FROM DRIFTING.—The yield of the B. M. Ex. Co. for last week, was 83 ounces worth, \$18.70 an ounce. We do not know the number of drifters employed, but the total number of men at work inside and outside, is said to have been about 30. One nugget weighed 21 ounces.

SIERRA BUTTES.—The work on the Sierra Buttes flume is progressing rapidly. They hope to complete it in a few weeks. The mill will be completed in about three weeks.

Trinity.

NEW FIND.—Trinity Journal, July 18: It is reported that D. C. Dedrick has found a rich prospect at the head of West Weaver—on the Weaverville side of Bally.

RIDGEWAY.—We learn that the Ridgeway mine is still looking very well and that the mill will be started up soon. They have considerable work to do to put the mine in good working condition.

Yuba.

A DEERIS DAM.—Marysville Democrat, July 17: We have been informed by parties who are in a position to know, that the Excelsior M. Co. contemplates the erection of a large dam on the old bedrock channel leading from their mine at Smartsville to Timbuctoo. The object of the dam is to impound the debris from the mine with a view of operating said mine at times by the hydraulic process. The dam is to have sufficient capacity to hold the debris for several years, and after it has been completed the company will ask the proper authorities to pass upon it, and, if satisfactory, will ask for a modification of the injunctions now upon them. At present the mine is being worked by the drift process, which is not so rapid and far more expensive than the hydraulic method. The company hopes to satisfy all parties interested that the debris can be safely kept from the Yuba river.

NEVADA

Washos District.

CON. CAL. & VA.—Virginia Chronicle, July 18: 1100 level: At the point in the south drift from the shaft station on this level where the ore discovery was made we have continued to stope out ore of good quality below the sill floor, working from the bottom of the winze (18 feet down) upward. 1300 level: Have extracted some milling ore below the sill floor of the crosscut run east from the south drift, 1500: From the end of the crosscut run west from the north drift on this level we have continued to extract good ore from the sill floor upward to the ninth floor. The stope above the ninth floor is in low-grade ore. 1600: The ground in the vicinity of the drift run east through the old stopes on the sill floor of this level continues to yield some ore. Have continued to stope out good ore at the point which is 200 feet south from the north line of the mine, and 44 feet above the sill floor of this level. 1650: The various openings of this level have continued to yield the usual quantity of ore. Ore of fair quality has been extracted from the drift run west from the top of the upraise carried up 59 feet above the southwest drift, also from the drift run east from the winze No. 3, 73 feet down, in working upward from that point. 1750: In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. There has been extracted from all parts of the mine during the week 2326 560-2000 tons of ore of which 895 1350-2000 tons were shipped to the Morgan mill and 1430 170-2000 tons to the Eureka mill. The average assay value of all the ore worked at these two mills during the week (2360 tons) was \$23.85 per ton. Bullion shipped to Carson mill, assay value \$20.92.82. Bullion now on hand in our assay office, assay value about \$25,000.

OPHIR.—1465 level: We have continued our prospecting work from the openings in the vicinity of the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level. No ore has been extracted during the week. 1500: Have continued repairs on the incline leading from the shaft station on this level.

MEXICAN.—On the 1465 level the east crosscut No. 1, at a point 618 feet in from the main north lateral drift, has been advanced 30 feet in soft vein matter and clay carrying narrow stringers of quartz.

UNION CON.—A northeast drift started from the east crosscut No. 2 on the 1465 level, at a point 853 feet in from the main north lateral drift has been extended 26 feet in a mixed formation of clay, porphyry and quartz.

BEST & BELCHER.—1000 level: East crosscut from northwest drift advanced 10 feet; total 75 feet. Face in porphyry and stringers of quartz. West crosscut No. 1 has been advanced 18 feet through hard por-

phyry and stringers of quartz. There is water still flowing from face of same.

GOULD & CURRY.—On 200 level: Have done considerable repairing in upraise No. 2, also carried it up seven feet; total height 95 feet; face in hard quartz showing some value. East crosscut No. 1, 65 feet above this level, has been extended 15 feet; total 55 feet; through porphyry and quartz giving low assays. West crosscut has been advanced 14 feet; total length 82 feet; through soft porphyry. Have done considerable repairing on the 400 level in order to keep connections open.

OCCIDENTAL.—Extracted 240 tons of fair-grade ore from the stopes on the 350, 400 and 450 levels. Have put in a chute and are now prepared to extract ore from the 600 level. At a point 150 feet south of No. 1 winze, 750 level, have started an east crosscut from the main south drift. The face is now in low-grade quartz. Have milled during the week 210 tons of ore of the average value of \$14.90 per ton.

SIERRA NEVADA.—On the 630 level west crosscut No. 1, from the northwest drift, 571 feet from the shaft, is advanced 687 feet, 37 feet having been made during the week; formation siliceous in character. The Kenosha tunnel was enlarged and repaired 31 feet during the week. Total, 441 feet.

ALPHA.—North drift from west crosscut, 100 feet north of shaft, 500 level is out 37 feet; face in quartz yielding low assays. North drift from winze, 80 feet north of shaft, 550 level, is out 24 feet; face in quartz and clay. The south drift, same level, is out 22 feet; face in quartz showing bunches of ore.

CHOLLAR.—The east crosscut from the joint Chollar and Norcross winze 1500 level, is out 20 feet; the last 12 feet in quartz yielding low assays. Extracted and sent to mill the past week, 527 tons of ore, worth \$19.89 a ton as per battery assays.

UNION SHAFT.—The west drift from the shaft, 900 level, has been advanced during the week 70 feet, making a total distance of 643 feet; face in clay and porphyry.

ANDES.—On the 420 level repaired a portion of the east crosscut. North drift from east crosscut was advanced 9 feet; formation quartz and porphyry. East crosscut No. 3 advanced 16 feet; in quartz yielding low assays.

POTOSI.—The winze is down 31 feet below the 1500 level. The bottom is in porphyry and streaks of quartz yielding low assays.

UTAH.—The south drift from the bottom of the winze station has been extended 43 feet; total, 136 feet; this drift continues in a porphyry and quartz formation.

ENCHENQUER.—East crosscut on north line, 600 level, is out 261 feet; face in porphyry.

Hawthorne District.

LAPANTA.—Walker Lake Bulletin, July 15: The stope above the east drift No. 6 incline is turning out considerable high grade ore. Drifting east from winze below the 100-foot shaft level, at which point have a fine body of ore about 18 inches wide. Also sinking below the 100-foot shaft level at a point about 150 feet east of the shaft, showing good ore.

PAMLICO.—The only work during the week has been driving the main tunnel.

CENTRAL.—Sinking below the 150-foot level and stopping above the 75. Vein turning out well.

MOUNTAIN KING.—Have started drifting on the main ledge to the north on a strong vein about six feet wide, with a streak of high grade ore on the foot wall.

FAIRMOUNT.—During the week, track has been laid in the main drift and tunnel, and drifting ahead resumed. Ore showing in the winze below the tunnel. Ledge 10 inches wide and all high grade.

CAPITAL.—Still drifting for the ledge with every prospect of reaching it in a few days. Have encountered several very rich small pieces of antimonial silver ore.

HARTFORD.—Still sinking on ledge, producing lead and gold ore, ledge showing strong in bottom.

BEACON.—Stopes from incline still producing the usual amount of ore.

GOLD BAR.—South drift, Martinez tunnel level, has been extended 10 feet during the week. Ledge strong, and producing very rich ore.

IDA.—Still producing the usual amount of ore some of which is very high grade.

NEW YORK.—During the week the tunnel has been extended 10 feet, intersecting the parallel vein, upon which a drift has been started to the south.

Highland District.

CHLORIDE.—Pioche Record, July 16: The work of T. E. Edwards and William Lloyd at their Chloride mine is turning out nicely. The claim lies on the west side of the range about four miles from the brewery. Starting on an iron stain, a few feet led to iron ore carrying a good percentage of lead, which has now changed to carbonate ore heavy in lead carrying well in silver and at a depth of only eighteen feet. It is regarded as a very promising prospect and the present work will be continued.

ARIZONA.

TUNNEL.—Prescott Journal-Miner, July 15: The new tunnel being run to tap the Senator vein is now in about 300 feet. The mill continues to run successfully. Ferguson and Burmister's Jersey Lily mine is lying idle. This is a good gold property, and runs about \$50 in free gold. The vein is well defined, about 18 inches in thickness, and can be easily worked. The water has all been taken from the Silver Belt mine and the old workings have been thoroughly cleaned out and the work of taking out ore will be commenced to-morrow. Superintendent Clark brought in another fine large specimen of ore to-day from the mine. It will go away up in the thousands in silver. A new discovery has been made about two miles west of the old Railroad mine, Hassayampa district, by Burrows and Goff, two good miners and prospectors. The vein is in porphyry, carrying gold and silver, and averages about \$100 per ton, principally gold. They have started a tunnel on the vein, to determine its extent and richness. The main tunnel on Dan O'Boyle's Grayhound mine is now in about 80 feet, all in quartz and ore. The crosscut at the 50-foot level is finished and shows a 36-foot ledge. It is the intention of the owners to still push the tunnel until a depth of 250 feet shall be reached, when an east and west crosscut will be run to determine the extent of the ore body. This is a valuable piece of property, and will prove the merits of the big mines of the Hassayampa district, in which it is located. "Piute Dyke" is the name of a mineral vein or

dyke, situated about one and a-half miles below the Blue Dick, Hassayampa district, and is known by every old prospector in Yavapai Co. It has been located and relocated for years, but until lately nothing has been done on the property. About three months ago W. H. Ferguson and son made a discovery which proves that Yavapai Co. has merely been run over, and that close prospecting is all that is wanted to open up new and lasting dividend-paying mines. The ore is in silicate of iron, carrying a high grade of horn silver and chlorides. The main shaft is now down 40 feet, and has more than paid expenses. The vein at this depth is strong and well defined, and shows every indication of permanence. R. H. Burmister, who is interested with Mr. Ferguson, has men working on the property getting out shipping ore. Some assays go as high as 2,200 ounces in silver.

IDAHO.

DE LAMAR.—Nugget, July 16: Everything at the De Lamar mine and mill has run during the present month so smoothly and regularly that it leaves nothing to be said, further than repeating that everything is going on satisfactorily. Men are at work cribbing the creek and preparing foundations for the new 600 horse power Corliss engine for the improved mill. The new machinery for the mill will begin to arrive this week. New platform scales are being put in opposite the office to weigh freight arriving and shipping ore going out. Wm. Henderson and Frank St. Clair have located a claim just where the wagon road forks above Moss' fence, where the road turns up the hill going toward Jordan Valley. They have a large ledge showing on the surface, probably the connecting link between the mines at De Lamar and the new Cow creek discoveries. The wonder about all this is that such a ledge, and good flat scattered all around it, should not have been located years ago, as it is on a road which has been traveled for a quarter of a century. The very day it was located other parties discovered it was "just like the Twin Brothers' claim on Cow creek" and went there to locate it, only one hour too late.

MEADOW CREEK.—Alf. Sotheren was in the camp on Sunday from his Meadow creek claims, which he is prospecting with four men. He has located three claims on Bridge creek, all on the same ledge, which he says can be traced on the surface for fully a mile. He says the ledge is some three feet wide, one foot of which, by prospects made with a horn, shows good pay gold ore. Assays show the value of the bullion to be \$75 per ounce and very free milling. He feels confident, he will develop mines that will open up a new district, and that they will be in a country easy of access and where wood and water are abundant. A good many years ago rich float was found in this vicinity, and one placer mine has been worked right along every spring, and the impression has long prevailed that there were rich deposits there somewhere.

MONTANA.

ABOUT THE ANACONDA.—Inter-Mountain, July 15: Marcus Daly is expected home to-night. With his coming arise the numerous rumors and reports about the resumption of work at the Anaconda properties. There is no truth in the report that five carloads of oil had been ordered. In fact, nothing has transpired to show even the slightest change in the situation. If there is a man in the country who knows when work will resume that man is Mr. Daly and he keeps his own counsel. There is not the slightest indication that points to a resumption of work. All the railroad officials are in ignorance on the subject. Traffic Manager Donahue says he would be only too glad to announce that the mines would start up again, and said if he knew anything about it he would not keep back the good news. Business men no longer bother themselves about it. Trade is brisk in all lines, though some houses are carrying a good many people along. What the next few days may bring forth is not known and it is likely that some definite news may be given out, but as to this it is like everything else, mere guess work. Some work is being done at the mine. The engineers are at their posts daily, but all that is being done is keeping the mine clear of water.

STRIKE IN THE SOUTHERN CROSS.—It is reported that an important strike has been made in the Southern Cross. A force of men commenced breaking ore on the 150-foot level last week, preliminary to the commencement of shipments to Butte and Helena, and before driving west more than one or two sets came into a body of ore which is of higher grade than any heretofore shipped. It is said to sample about \$50 as an average of a 14-foot breast. It is, besides, of a very fine quality as an iron flux. Its importance to the stockholders, of course, depends on its extent, which can only be determined by the developments of the next week or two.

STRIKE IN THE GLENGARRY.—Inter-Mountain, July 18: Another strike is reported in the Glengarry in 350-foot level. The extent of the new find is not known yet to the company. Mr. Carney is going up this evening to investigate. It is reported, however, to be very rich. It is understood that O'Hara's mine, out at what is known as O'Hara's camp, in Jefferson county, is under bond to D. G. Bricker for \$40,000. Since the last report the following silver bar shipments have been made by the express companies:

	No. Bars.	Est'd Value.
Lexington ..	9	\$19,024
Alice ..	20	30,320
Bluebird ..	10	16,384
Moulton ..	8	11,702
Butte Bird ..	11	15,840
Totals ..	58	\$92,840

MINERS WANTED.—E. H. Schaffels writes us as follows from Sonora, Tolueme Co.: "Will you please notify the idle miners that at this time 25 good miners are wanted by the mines of Tolueme Co., at the Golden Gate mine. Men familiar with air compressors, power drills and shaft work are wanted in addition to miners. At the Keltz, Belle View and Eureka Co., miners are wanted. That class of men who need a fan or sunshade and food champagne are not wanted. Good reliable men can secure their \$3 a day. Board \$6 a week."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 14, 1891.

- 455,917.—KNIFE-SHARPENER—J. S. Blood, Napa, Cal.
 456,018.—TONGUE SUPPORT—T. C. Churchman, Sacramento, Cal.
 455,997.—NOISELESS CHAMBER ATTACHMENT—Virginia M. Cone, Alameda, Cal.
 455,909.—BABY CARRIAGE—Davis & Dicks, San Jose, Cal.
 455,743.—WAVE MOTOR—R. B. Davy, San Diego, Cal.
 455,999.—DEVICE FOR OPERATING ENGINE INDICATORS—Jas. Gill, Portland, Or.
 456,129.—SASH-FASTENER—Axel Johnson, Oakland, Cal.
 456,039.—CAR-COUPLING—Jos. Kormil, Golden-dale, Wash.
 456,042.—ROLLING PIN, ETC.—Jane L. Landrith, Marshfield, Or.
 456,049.—PLIERS—W. J. Monteith, Albany, Or.
 455,858.—WINDMILL—Thos. Pepper, San Diego, Cal.
 456,057.—BALING PRESS—E. M. Pine, Puyallup, Wash.
 456,060.—ICE CREEPER—M. E. Reilly, Martesano, Wash.
 456,006.—STATION INDICATOR—W. T. Snedden, S. F.
 456,098.—STATION INDICATOR—G. H. Tietjen, S. F.
 455,914.—CULTIVATOR—J. V. Webster, Creston, Cal.

The following brief list, by telegraph, for July 21 will appear more complete upon receipt of mail advices: California—Chas. G. Ruthe, San Francisco, revolving cylinder engine; John T. Davis, treatment for coconut husks; Nathaniel T. Whiting, device for supplying water to vessels; Richard J. Crowley, Los Angeles, signaling apparatus; Axel Johnson, Oakland, sash balance; Delbert E. Barton, Alameda, clamp for attachment of cultivator teeth; Henry C. Fletcher, Oakland, valve for controlling mechanism for gas engines; William Mahoney, Santa Cruz, safety cap for powder kegs; John R. Woodward, Riverside, prop; John C. Calver, Calistoga, window cleaner; James McKenna, Martinez, feed cutter; George Allen and J. Landhofer, Auburn, vehicle tongue support; Charles W. Thompson, Tomales, gate; Zachariah W. Shields, Harrington, Wash., gunlock; Hewitt Wilbur, Ritzville, spring motor.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraph). American and Foreign patents obtained and general patent business for Pacific Coast inventor, transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CULTIVATOR.—Jonathan V. Webster, Creston, San Luis Obispo Co. No. 455,914. Dated July 14, 1891. The object of this invention is to so construct the frame and mount the teeth of the cultivator thereon, that these teeth will so stand with relation to each other, upon the different parts of the frame, that when the cultivator has passed over a surface of ground equal to its width, the teeth will have stirred and cultivated every portion of the ground so passed over. A further object, is to so construct the teeth of the cultivator, that they will present as little obstruction as possible, will cut up and loosen the soil, and may be made adjustable with relation to the line of travel, to suit the conditions under which they are to work. A combination of levers is adopted by which the whole of the frame-work, of the cultivator may be raised or depressed simultaneously without changing its plane of motion. The frame timbers are united so as to form a pentagon, having the angle or apex formed by the meeting of two timbers at the front. The arrangement of the timbers is such that the teeth on the outside timbers stand with relation to the line of travel so that each tooth stirs and cultivates the soil in a line which will just meet and overlap the line of the next adjacent tooth; and the rear tooth upon each of the outer timbers is in such a position with relation to the front tooth of each of the inner timbers that these latter just overlap and continue the track made by the outside teeth. Land-sides extending backward steady the machine and prevent it sliding. By this arrangement the whole of the soil from one side to the other for the complete width of the cultivator is thoroughly disturbed and agitated by once passing over the ground. A peculiar tooth is employed consisting of a broad thin blade of steel. The front edge of the shank of the tooth is heveled upon one side, this side being the one which will travel next to the land, and the attachment at the upper end of the shank is such that the shank and tooth may be turned with relation to the line of travel so as to be thrown a little to one side or the other of this line, so as to lessen the draft or give a greater or less turning capacity. The front edge of the shank is made so sharp that it will cut up soil of the hardest description. At the bottom, the shank is turned abruptly into a nearly horizontal position with reference to the vertical plane, but the rear portion is turned up slightly more than the front and is extended, so that it makes a triangular-shaped tooth having a beveled edge which is sharpened in the same manner as the front edge of the shank and in continuation of the same. By turning the shank of this cutter and adjusting it with relation to the line of travel the position of the foot or lower portion will be correspondingly changed and the cut will be varied to correspond. By means of a single lever the whole of the teeth of the cultivator may be correspondingly raised or depressed to vary the cut which they take in the soil. We have good reasons to believe the patentee has made a good invention that will render cultivation practicable to a wider range and extent than heretofore, and we hope in due time to present a pictorial view of the implement to our readers.

KNIFE AND SHEARS SHARPENER.—J. S. Blood, Napa. No. 455,917. Dated July 14, 1891. This is one of that class of sharpeners in which opposing

polygonal steel plates are mounted upon a suitable handle, the blade of the instrument to be sharpened being drawn between the opposing edges of the plates. In this device the angle may be varied to suit different blades by turning the plate, and the angle between the two plates can be similarly varied to suit different thicknesses of knives. This peculiar shape of plates gives sixteen positions to sharpen knives by the turning of the plates and their reversal.

SASH-FASTENER.—Axel Johnson, Oakland, assignor to the Marshall Improved Window Furniture Co. of S. F. No. 456,129. Dated July 14, 1891.

This sash-fastener relates to that class in which a turning button in the window-sash acts to withdraw and to release a spring-controlled detent or pawl by which the locking is effected. The invention consists, in combination with this turning button, of an arm or piece projecting into the path of the button, whereby the latter, when the sash is moved, comes in contact with and is turned by the arm or piece, thereby automatically locking the sash. The object of the device is to provide for automatically locking the sash. This may take place when the sash is closed, so that the consequences of neglecting to lock it are avoided, or it may take place at any point in the movement of the sash, thereby serving as a safety device in case the sash should drop from from any cause.

Mining Share Market.

Comstock Mining Shares the past week, strengthened under more open buying by the pool, combined with some outside orders. There is no sign that the pool has sold any shares for at least a month past, but everything warrants the assertion that they bought. But as far as that is concerned, it is tasted in seemingly well informed quarters, that the pool has been concentrating certain stocks for many months past, with which they have not parted, even in the smallest way. Whether this concentrating means a small sized or large sized deal, the writer can not say, but all present moves warrant the assertion, that it will be one of the pure unadulterated good sized deals, after which, looting the mines, in which it is well known there are large bodies of high grade ore. It will take them many months to loot several of the mines. It now looks as if the pool will make the deal this fall with the shares of the North end mines, assisted largely by the Middle mines' shares, with the Gold Hill mines sympathizing, yet the present appearance of the market can and may be changed before the deal is over. In outside shares, dealing has been light, but the tone appears healthy. In the Bodies, Bodie has strengthened while Bulwer and Mono receded. The strength in Bodie is due to the bright promising condition of the mine and the stock being well in hand, yet well informed parties affirm that no decided improvement in the stock will be had, until after the levying of an assessment. Of course, this will be done to create the belief that most of the stock is out.

It is a remarkable feature of the history of the Comstock mines, that in nearly every instance when Sam Jones is appointed superintendent of a mine, that in some unaccountable manner the high grade ore and the certainty of a large body being uncovered as reported by his predecessor, dwindles down to nothing.

The Territorial Enterprise, July 21, says: Should pay ore in quantity be struck by the westerly workings of the Sierra Nevada, there would follow a general movement west along the line from the Utah to the Alta. If the Enterprise would show more enterprise and "dig up" mining records as published in its own columns years ago, it would find that several years ago high-grade ore was run in to the west in Sierra Nevada, but the shares of the mines were then and have been since so distributed as not to warrant its development.

It is questionable whether the rich ore reported by the superintendents about 12 years ago in some of the Gold Hill mines, and which were afterward flooded, will be developed for the benefit of outshareholders. No wonder big salaries are paid to some of the mine officials when it is considered how hard and wearisome must be the work to make ore, which goes over \$60 a ton, run a company in debt or, if not in debt, then barely keep even.

News from the Comstock mines is confirming that heretofore published in this department. They are now speaking more hopefully of the 1750-foot level in Con. Virginia, this level we have always claimed was where the true business lays, although one or more of the upper levels will play an im-

portant part in the coming deal. In Ophir and Best and Belcher developing work is being vigorously pushed. The ore lying to the west in Hale and Norcross and also in Savage, is proving to be high grade and of considerable size. If these mines were differently managed, outsiders would have more confidence in getting their money out of any ore found, perhaps it is part of the game not to inspire confidence. An ore development in Potosi and Bullion is being noised—perhaps they have a line of shorts, or else a line of stocks to sell, but ore can be shown in either mines whenever desired. In Seg. Belcher, Overman and the other Gold Hill mines the work is growing in interest. Overman's assays should steadily increase. In several of the mines whose shares sell for a trifle, quiet but important work is being done. From the outside mines, our advice are still of an encouraging character, confirming what has heretofore been published.

As if to verify our former statement regarding the west ledge of the Comstock, known as the Red Ledge, the northwest drift in the Sierra Nevada mine on its 630-foot level and at a distance of about 575 feet from the shaft, has passed through the syenite which was supposed to be the foot-wall of all the claims on the Comstock and the solid mountain itself, and has entered vein matter on the other side. This fact should be sufficient for all time and should forever dispel the theoretical error that there is but one ore-bearing vein known by the Comstock Lode. The west ledge is an established fact. Now then, gentlemen, go ahead and open up the continuation of this west vein in the Union, Mexican, Ophir, and West Con. Va. mines. This ledge is now definitely exposed in Sierra Nevada as well as West Con. Va. a distance of 2000 feet south of the Sierra Nevada. Then comes Savage. The east tunnel some 900 or more feet west of the shaft, has connected with the old Sinaloa shaft, and the said shaft is being sunk in the west ledge.

Woodbury Concentrators.

These machines are meeting with a success that must certainly be gratifying to the manufacturer, Mr. Geo. E. Woodbury. This week a reporter for the PRESS found him in the act of shipping one to Australia, with a prospect of sending several more in the same direction. In addition to this, Mr. Woodbury has, within 60 days, placed one near Marysville, three in Amador county, three in Leadville, Col., with 12 more ordered for the same State. Special machines are also being built for the tin ores of Temascal. The appended business letter expresses the general feeling with which the concentrators are regarded where they have been used and are known.

YANKEE BOY MINING CO., DURAY, COLO.,

June 15, 1891.
 GEO. E. WOODBURY, Esq., 213 First St., San Francisco.
 DEAR SIR:—Have been at mine nearly all the time, hence delay in answering your letter. Your concentrator is entirely satisfactory. Will instruct hook-keeper to send you check soon as our pay-day arrives (20th). Will write you more about your machine when I have time.

Very truly yours,
 F. M. ENDLICH.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others,

MECHANICAL PROGRESS.

Power Without Fire or Steam.

The production of power without fire, steam or electricity would seem to be an absurdity—an impossibility; yet that is just what is claimed as an accomplished fact by one who is said to be a well-known inventor of New York city. The invention, if it is one, has been made public by a reporter of the New York *Herald*. The principle said to be involved in the invention is the ready control of certain forces similar in character to those which have long been used in explosives. Numerous attempts have been made to harness and render practical for ordinary power purposes the tremendous energy pent up in explosives. The gas engine, which is run by successive explosions of gas, is the only near approach to success which has hitherto been made in that direction. The utilization of the sudden and explosive expansion of water into steam has been attempted, but without success. We give the following for what it may be worth:

Our New York inventor claims to make use of explosive compounds in a liquid condition to accomplish his purpose. According to the *Herald* reporter, who claims to have been admitted quite fully into the secrets of the inventor, the perfected apparatus shows, in the first place, the reduction of the elementary explosive compounds, in proper proportions, to a certain fluid consistency, which fluid, by graduated motion, is fed into a chamber, from which, by its expansion, the power is obtained, and by its application to the common steam engine made to operate with the same effects as when run by steam.

True, says the inventor, the method is revolutionary, and at first thought, its successful operation might be considered altogether Utopian; but he claims that in his experiments, he has already passed the improbable line, and is simply perfecting his mechanism to demonstrate in the fullest manner the principles involved. He claims that this power can be handled quite as easily as steam, and with considerably less liability to accident. Elaborate drawings and working plans have been prepared, and inspection of them was afforded. Based upon these plans and a working model, the necessary steps have been taken to secure letters patent in all the principal countries of the world.

Said the inventor: "I propose to dispense with fire, coal and water and yet obtain all the power necessary."

"In the first place, my apparatus solves the street railway problem, for each car can be supplied with a simple mechanism whereby, with no overhead or underground wires, the motive-power to drive, heat, light and control the car may be obtained. Steamships may be run without boilers to generate steam; elevators can also be operated and steam and water dispensed with."

"Electric energy is procured by operating a dynamo, as by steam, and by the small cost many uses will be made possible, now debarred by the great expense of steam. The expense of the mechanism necessary will be from 200 to 500 per cent less than cost of a steam plant. In generating electricity, the cost is vastly reduced. The machine is practically automatic, and the power, heat and light derived, depend only on the will of the operator."

"The railroad locomotive will require no tender for the carriage of fuel; trains can be driven at high speed at minimum cost. Submarine vessels, now impracticable from lack of ability to store sufficient power, can be, when supplied with my apparatus, operated successfully. At will the sail yacht can be quickly converted into a swiftly driven propeller yacht."

How Can This Power be Produced?

"You know that you can by air expansion drive a wedge through a bar of iron; with powder you can send a 1000-ton rock or throw a projectile 12 miles. With nitro glycerine you can make an acre of land a yawning cavern; by means of gun-cotton a ship can be lifted out of the water, with Emmonzite a steel rail can be splintered; with Wetteren smokeless powder a velocity can be given to a shot of nearly 1900 feet per second, with an initial pressure of 47,000 pounds, using only 36 grains, and the projectile thrown 2½ miles. The powder used in rifle shells in the United States army causes bullets to reach a velocity of 1400 feet per second, with a pressure of 35,000."

"Now, suppose you acquire this power in reduced ratio, the minimum force is at command; graduate the force, bring it into subjection, and then you can comprehend the underlying principles of this new power producer."

"The machinery is arranged to prevent reflexible action, and no danger results in transmitting the force, which is procured from a combination of explosive ingredients which are at hand. In their manufacture, application and control lies the secret of my success."

"So accurately is the mechanism arranged that the ingredients, in almost fluid form, are fed into the first chamber of the machine, where ignition and expansion first takes place. Overrun of the fluid is impossible. After ignition the vapor, or ether, escapes through the vents to a low-pressure chamber attached—yet independent—where surplus force is utilized; the final residue escapes through a pipe into space."

A WONDERFUL MECHANICAL PROCESS.—The process of rolling railroad rails, of Bessemer steel, as practiced in Germany, is declared to be one of the most perfect mechanical operations in the world. The steel is cast in blocks which contain sufficient material for two or three rails, these blocks, while still red hot, being carried to the preparatory rolling mills by horses which have been trained to work in the midst of this fire and noise; here they are kept hot, in special furnaces, and are rolled into longer blocks having a square cross-section. After being thus prepared, they are taken to the rail rolling mills, which consist of two complete rolling mills, with all the appurtenances in one apartment, and the blocks which come from the preparatory mills are heated again and then passed between the rollers, of which there are three placed one above the other, so that the rails are rolled during the backward as well as the forward motion without requiring a change in the direction of rotation of the rollers. The rails have to pass back and forth between the rolls 13 or 14 times, and each time that they come from the rollers they are caught by the workmen on the short, bent ends of long levers which run on rollers on movable carriers. Each time the rail passes from between the rollers it is longer and its cross-section narrower than after the former rolling, until it finally stretches itself out like a gigantic fiery snake. It is then taken to a circular saw, which cuts through the glowing metal with perfect ease, dividing the long bar into two or three rails. The cold ring is now put under presses, by means of which the slightest irregularities are removed, and then the holes are bored, the end surfaces evened, etc.—*World's Progress*

A NEW PHASE IN STEELMAKING.—The first practical results of a new process of steelmaking have just been reached by the running of the first heat from a new experimental open-hearth furnace at the Sheffield Technical School. The process is the outcome of the researches of Prof. Arnold, and consists in removing all the impurities from Swedish pig iron with the exception of the exact proportion of carbon required for a given purpose, thus obtaining the ideal carbon and iron steel, homogeneous in structure and free from blowholes. These results are said to be obtained without the presence of more than mere traces of manganese and silicon, and also without the use of iron ore. The average time occupied by this process in the conversion of a ton of pig iron into the highest class of steel yet made will be about three hours, the fuel used consisting of about half a ton of rough slack. The run is stated to have been perfectly successful, the ingots showing a very high-quality steel. It is anticipated that the range of the metal produced will vary from what will be practically wrought iron to the hardest tool steel. The new furnace, together with the general plant, was designed to Prof. Arnold's specifications by Mr. B. H. Thwaite, C. E., and is intended to produce three tons of steel in the 24 hours.—*London Iron*.

BORING OUT GUNS.—Nearly all the inner tubes for modern rifle guns are bored out from the solid. The great Krupp gun recently made for the Russian Government, 44 feet long and weighing 135 tons, 16½ inches bore, was bored from the solid, with core bits, a tool like a crown saw or a diamond rock drill that cuts a thin groove around the core which is removed whole. In England a good many of these inner tubes are made of compressed steel, cast at the Whitworth works, but the main parts are bored. The first cut is a small hole of 1½ inch to three inches in diameter to guide the heavy tools, then a D bit follows, completing the bore to full size, less the finishing out.

MANY WILL BE SURPRISED to learn that the new metal aluminum must be annealed with great care, as it melts at almost a black heat, and has a little of the power action where a light heat is to be made use of. It is awful stuff to solder, but, strange to say, it has been welded to glass. However, there is nothing like getting used to a metal before all its uses are to be made known. At the price it is now quoted, it should be found on the market along with brass tubes and the like, where lightness of material is sought for.

THE WOOD VULCANIZING PROCESS seems to be rapidly commanding the notice which it so fairly deserves, if but a modicum of the claims made in its behalf are susceptible of actual demonstration. Wonderful results in heat-treating as well as curing all finished lumber are shown, and in addition to its preservative qualities, the merit claimed for it of exceptional cheapness should enlist the attention of the car-builders' trade particularly.

IRON VS. STEEL AXLES.—At a recent meeting of the North Railroad Club, London, England, Mr. George Dickson of the Great Northern railway read a paper on axles. His opinion is that the steel axle is cheaper than the iron, although, perhaps, not so safe. The failures of iron axles are less from breakage than from seamy defects, which are most apparent in the journal.

REPAIRING OF RAILS BY ELECTRICITY is said to be the inventor's latest achievement. The inventor proposes, first, to soften the metal by the passage of a great volume of current, and then, by means of a saw, cut out a defective portion. A sound piece of rail is then fitted into the gap and welded, electrically, into place.

SCIENTIFIC PROGRESS.

Improving the Phonograph.

Possibilities Which May Result Therefrom.

Efforts are being made, which it is thought may be successful, in so improving the phonograph that sounds which actually occur, but which are inaudible to the human ear, may, by the aid of the improved phonograph, become quite sensible to our auditory nerves. It is expected by this means to prove that even insects which are now supposed to be perfectly silent, shall be shown to have a voice or be capable of making their presence known by some mechanical sound—in fact that there is no such thing as absolutely dumb existence.

At first thought, says a contemporary, such an achievement seems altogether impossible. It does not seem credible that a sound so faint that it can make no impression on the human ear, could impress itself on the still coarser material that receives phonographic records. But science has recently advanced a new theory in relation to sound, and it is upon the truth of this theory, that the inventor bases his hopes of success. Sound is audible or inaudible to the human ear in proportion to the rapidity of the vibrations in the atmosphere that are started by the exciting cause. Up to a certain number of vibrations per second we are enabled to hear, but beyond this number our sensations are too slow and dull to receive impressions. Could the performers in a grand opera sing and play, in sufficiently fast tempo to exceed this number, the performance would seem to pass before our vision in dumb show.

Admitting the truth of this theory, which is also applied to vibrations of light, the limited number of vibrations enabling us to see objects and a greater number making us blind, it is hard to conjecture how the inventor hopes to compel his now inaudible insects to sing slow enough for his experiments. But if he can succeed in making a record of sounds inaudible to the ear, he may also open the way for the solution of still greater mysteries.

What, after all, is the mystery of Immortality, but a state of existence governed and made palpable by more active sensations than our own? Could we quicken our vibratory receptivity by so much as one octave—one octave of light and one octave of sound—we might possibly be enabled to look directly into the courts of the New Jerusalem, and to hear the angels sing, if they do sing. Can it be possible that the phonograph and the photograph combined will eventually place men in direct communication with our dear departed?

With such a possibility, our spiritualist friends must learn to be more scientific and more mechanical if they expect to bring conviction to this object-loving age. Of course, if the soul is immortal, there is a point somewhere where the visible and audible would step into the invisible and the inaudible, and we should be able to follow up the line theoretically, and to demonstrate it mechanically. But pianchette will not do. The now vanished Madam Dis Dabar will not do. Neither will any of the photographs of the departed that have been palmed off as the product of veritable sittings do. Neither will the asserted materialization of departed friends, who come so realistic, so warm and so plump with life and flesh, be any longer received as other than clever illusions palmed off upon us by deceiving mediums. If our lost friends have power to come to us with their natural voice, when asked by so-called mediums, they certainly ought to be able to communicate with us through the medium of the phonograph, if it is ever perfected to the extent hoped for by some of our enthusiastic inventors. But perhaps even then, we of this realistic age might not be willing to accept the evidence; unless they come armed with a certification from St. Peter, or some other equally reliable testimony as their condition and opportunities in the shadow land might enable them to produce.

RECENT RESEARCHES IN IRON FORMATIONS.—In a recent paper by Prof. Rucker, of England, allusion is made to the action of deep igneous rocks on the dipping needle, which he thinks must be ascribed to the metalliferous nature of those rocks, and as the latter must have come from below, they may, he thinks, be fairly held as supporting the theory of an internal metalliferous mass. A further point is also made in this connection, that, in the meteorites which occasionally visit the earth, a common constituent is metallic iron, often so pure as to admit of its taking on a brilliant polish. It being a fact, therefore, that such iron exists in some extraterrestrial sphere, giving rise to those meteoric visitants, there is surely no reason, it is argued, why the metal should not exist in this state on the earth, and, seeing it is not found at or near the surface in such condition, metallic or native, the only other place it can be in is deeper down, or, in point of fact, in an internal mass. It is well understood, from various independent observations and calculations, that the specific gravity of the earth as a whole is about 5.5, while the average of rocks at the surface is rather under half this amount; and, while some have assumed that the increased specific gravity is obtained by excess of pressure, it is more generally considered—from the abundance of iron compounds in the crust and its apparent derivation from the igneous rocks, together with the suitability of its specific gravity for balancing up the

deficiency in the surface rocks—that an immense store of metallo iron exists in the earth at a certain depth, not yet determined.

THE COSMICAL TELEPHONE.—A correspondent of the *Scientific American* questions the possibility of Edison's cosmic telephone by which he hopes to hear sounds resulting from solar causes, because it is pretty well established that sound cannot travel without a medium, either solid, liquid or gaseous. So far as is known there is no medium between the earth and the sun beyond the limits of the terrestrial shallow atmosphere capable of transmitting sound waves, and until it is shown that such medium exists, the theory of inter-solar transmission of sound will not find ready acceptance among physicists. The strange sounds heard by Mr. Edison, as he states, while experimenting with the long distance telephone, if cosmic at all, were, it would seem, much more likely to have been of seismic origin. Furthermore, judging by present knowledge as to the rate of sound transmission, there could not have been any connection between the sounds heard and the observed sun spots, for if Mr. Edison, as he sneeps, really heard sounds from the sun, the cause that produced them must have taken place more than thirteen years before they could have reached the earth, unless it be proved that sound may be transmitted by radiant electricity or some other equally rapid agent. The correspondent adds that although Mr. Edison's experiments may result in important discovery, still at present it seems hardly probable that he will be able to hear the roar and crash of solar tempests, as inviting as the thought may be.

SANITARY SCIENCE.—Sanitary science, says the *Sanitary News*, is a science that does not relate to the earth we live on or to the heavens we live under, but to the conditions of the homes we live in. We can live on the earth or under the heavens without knowing much about them, but to live best in our homes we must know them well. Geology cannot change the conditions of the earth beneath us, or astronomy those of the heavens above us, but sanitary science can change from unhealthy to healthy the conditions of the homes we live in. Is it not then a science worthy of study? It touches the highest interests of mankind, cleanses and purifies the present generation, and will strengthen and will glorify posterity. The effects of obedience to its laws are not remote but immediate. They touch the everyday life of all, and enter into all the relations of life. They give strength and vigor to whatever capacity in which human endeavor is put forth.

THE DISCOVERY AND UTILITY OF THE GLASS LAMP-CHIMNEY.—Lamp glasses were invented by Alime Argand, the inventor of the famous lamp and gas burner which bear his name. He had been experimenting for some time in trying to loosen the light, but to no purpose. On the table before him lay the broken neck of an oil flask. This he took up carelessly and placed it, almost without thought, over the wick. A brilliant flame was the result, and the hint was not lost upon the experimentalist, who proceeded to put his discovery into practical operation at once. The chimney has the effect of heightening the light of a lamp because it increases the supply of oxygen to the flame by producing a draft, and concentrates and reflects the heat of the flame, in consequence of which the combustion of the carbon is more perfect and very little escapes unconsumed.

CRYSTALS OF PLATINUM.—Professor Joly has found that crystals of platinum and palladium are easily prepared as follows: A ribbon of pure metal is stretched horizontally between two binding screws. On the ribbon finely powdered topez is dusted, and an electric current passed through the ribbon of a strength sufficient to raise it to a bright red heat. In about half an hour, on examining the ribbon with a microscope, it will be found that very small, brilliant crystals cling here and there to projecting points of the partially decomposed topez. If the heat be maintained these crystals steadily grow, and in about two hours' time some will have attained to a size of about 0.1 mm. The crystals are opaque, and show a high metallic lustre, like that of clean mercury, but are somewhat whiter in color.

LORD SALISBURY is quite a distinguished savant as well as a renowned statesman. In a recent lecture before the Chemical Society of London, he said: "Astronomy is, in a great measure, the science of things as they probably are, geology is the science of things as they probably were, chemistry is the science of things as they are at present." To these adds the *Electrical Engineer*, "Electricity is the science of things as they probably will be."

At the depth of about 3500 feet, the temperature of the ocean is about the same, varying only a trifle, from the polar latitudes to the equator.

When Herschel studied astronomy only four double stars were known. Now nearly 7000 of them are distinguishable.

The Oakland Board of Trade has agreed to pay the electric railway company, which is to build to Haywards, a bonus of \$10,000 when the road is continued in to Broadway, Oakland.

ELECTRICITY.

Wonders of Electricity.

Incandescent Lighting With Only One Wire, and Lighting Without Any.

Something of what may ultimately be expected of electricity was demonstrated to the American Institute of Electrical Engineers at Columbia College, recently, by an electrician named Nikola Tesla. The experiments were in the line of the application of electricity to lighting, and Mr. Tesla showed that the best of the present methods can scarcely be considered as ranking with the A B O of the science as it manifestly will be understood and applied. He showed that incandescent lights can be fed with a single wire, that it is not necessary to provide a "dronit" for the electricity, but that lamps may be located at the end of a wire, and he showed that instead of the delicate and easily destroyed carbon filament now used for incandescent lamps a solid block of carbon that will last for an indefinite time may be employed.

This showing with reference to incandescent lighting sweeps away a large proportion of the expense of the system as it is now operated, and gives ample foundation for expectation, that the electric light will soon become the cheapest, as it is the best, light for common use in houses.

If this experimenter had stopped with his substitution of one wire for two, and his block of carbon for the carbon filament, his discovery would have been regarded as one of the most wonderful and useful of all the great electric inventions. But he did not stop there. He went much further, and demonstrated that electric lighting of rooms is possible without the use of any lamp. He showed that a room can be brilliantly lighted by electricity by placing on opposite walls sheets of zinc connected with electric wires and hanging anywhere between these sheets a glass tube from which the air has been exhausted. The plates create an electrostatic field, and the glass tube will produce the light anywhere within that field.

What the secret of Mr. Tesla's discovery is he did not reveal, but it appears that he transforms a powerful dynamic current of electricity into a static current at the point of utilization, which is something electricians had not previously been able to do. These experiments have attracted the attention of the most expert electricians in this country and Europe, and they anticipate more wonderful results than have yet been announced.

EDISON'S KINETOGRAPH.—Mr. Edison seems to be likely to meet with a serious impediment in the way of his enjoying either the honor or the profits of his "kinetograph" invention. It now appears that the originality of Edison's embryo invention of the "kinetograph," is controverted by a Mr. Rudge, of Bath, England, who, according to the London *Electrical Engineer*, "has prior claims which will hardly be disputed. Mr. Rudge has quite recently perfected an electrical arrangement which greatly assists in giving a faithful reproduction upon a screen of what we may term continuity of action. By means also of an optical arrangement not generally known, Mr. Rudge is able to project upon the screen a series of pictures in which the action seems continuous from one point to another. The eyeside seem to move, or the lips, or the arms, or whatever part of the body is in motion."

DEMAND FOR ELECTRIC MOTORS.—The demand for stationary electric motors is something enormous, and one firm, having headquarters at New York, reports that it is 2000 motors behind orders already received, and that other orders are pouring in from all sections of the country. The motors are used for all sorts of purposes, from the beating of carpets to the chopping up of sausage meat. A large number of orders are received every week from printers, and it is estimated that at least 200 newspapers are printed by presses run by electricity while thousands of job offices have discarded steam power for the new and compact motor.

THE SAN FRANCISCO AND SAN MATEO CONSTRUCTION CO., which is building the electric road to Redwood City from San Francisco, has bought land for its power house on the Sunnyvale tract, close to the San Jose road, about midway between the Market street ferries and the county line. The crossings of the electric road with the other car-lines of the city are now being put in.

AN ELECTRIC GUN.—A gun operated by electricity is a recent invention of Edward A. Hyde of Kenosha, Wis., who claims that guns made of paper or wood, and operated by his system, would be effective at long range.

THE NEW ELECTRIC RAILWAY running from Asheville to Rutherfordton, N. C., will be 41 miles long, and probably the longest in the country. Both passenger and freight cars will be operated.

LONG DISTANCE TELEPHONES.—Arrangements have been made for the erection of a telephone wire between Paris, Nancy and Epinal. Nancy is about 190 miles and Epinal 225 miles from Paris.

AN ELECTRIC TYPEWRITER is said to have been invented by a Philadelphian, by means of

which the operator can transmit his typewritten manuscript hundreds of miles.

NOW AND THEN.—Only a few years ago Edison was working for a modest salary. His income at the present time from various sources is said to be \$100,000 annually.

GOOD HEALTH.

Music as a Mental Tonic.

Its Value in the Treatment of Disease—Effect of a Pleading Melody.

The value of music as a therapeutic cannot yet be precisely stated. Of its wholesome influence in various forms of disease, however, there can be little or no doubt, says the London *Lancet*. In making this assertion, we do not, of course, assign to it any specific or peculiar action. It is no quack's nostrum, no reputed conqueror of ache or ailment. It is only, as we have already shown in a recent article, one of those intangible but effective aids of medicine which exert their healthful properties through the nervous system. It is as a mental tonic that music acts. Accordingly we may naturally expect it to exert its powers chiefly in those diseases, or aspects of disease, which are due to morbid nervous action. The evidence of its utility on occasions where fatigue or worry has disturbed the proper balance and relation between the mind and body of the so-called healthy, will explain its action in disease. We can readily understand how a pleasing and lively melody can awake in a jaded brain the strong emotion of hope, and energizing by its means the languid nerve control of the whole circulation, strengthen the heart-beat and refresh the vascularity of every organ. We can picture the same brain in forced irritation fretfully stimulating the service of the vasomotor nerves, and starving the tissues of their blood supply. Here, again, it is easy to comprehend the regulating effect of quieter harmony, which brings at once a rest and a diversion of the fretting mind. Even aches are soothed for a time by a transference of attention, and why, then, should not pain be lulled by music? That it sometimes is thus relieved we can have no doubt. It is especially in the graver nervous maladies, however, that we should look for benefit from this remedy. Definite statistics on the subject may not yet be forthcoming, but all that we have said goes to show that states of insanity, which are largely influenced by the condition of the sympathetic system, should find some part of their treatment in the hands of the musician. It is, therefore, for such cases especially that we would enlist his services.

A New Theory of La Grippe.

The unaccountable nature of the influenza commonly known as the gripe, has invited the theories of all sorts and conditions of men, not to say of doctors, but among all no one is, perhaps, so well calculated to commend itself to confidence as that of Sir Morell Mackenzie, M. D., who in a paper in the June *Fortnightly*, asserts that in his opinion, "the riddle of influenza is poisoned nerves," and from this hypothesis, "the bewildering diversity of symptoms becomes intelligible, if we regard them as the results of disordered nervous action." Dr. Mackenzie compares it to the extraordinary disturbance in telegraphic systems produced by a thunderstorm, and says this is nothing "compared with the freaks played by the living conductors in the human body, if anything throws the governing centers out of gear."

Now the theory of "poisoned nerves" is one that explains the almost infinite variety of attacks and curious freaks that mark the disease. No two persons, it is safe to say, have ever experienced precisely the same symptoms, and if it is a nervous disturbance, this is the natural result. Dr. Mackenzie regards the epidemic as falling under three general types, each of which include many varieties; these are the catarrhal, the digestive and the nervous. "Influenza," he says, "is the very Proteus of diseases, a malady which assumes so many forms that it seems to be not one, but an epitome of all diseases, and its symptomatology includes almost everything, from a cold in the head to inflammation of the brain. . . . It is really an acute specific fever, running a definite course like measles or scarlatina. . . . It is a disease with that superficial complexity of aspect which made Mrs. Carlyle playfully suggest that the doctors had agreed to call half a dozen different diseases by one name in order to simplify treatment."

Dr. Mackenzie adds that under all its disguises, he believes the disease to be perfectly simple; that the profound impression made on the nervous system by the poison, explains nearly all the after effects of the malady, and especially that curious loss of vital energy, which is so disproportionately great in comparison with the disease itself. The cause Dr. Mackenzie believes to be a living germ, airborne, but of what nature is not yet, he believes established.

RELIABLE STATISTICS show that the percentage of insanity among farmers' wives is greater than in any other class. The explanation is they work too hard, are left alone too much, and have too little chance to take recreation and enjoy society.

ENGINEERING NOTES.

Jet Propulsion.

The idea of propelling ships by jet propulsion seems to be attracting much attention just at this time, and quite a number of apparently valuable suggestions have been made to aid in reaching a successful solution of the problem.

One writer in the *Scientific American* suggests that "in order to make the jet effective a large volume of water must be handled and thrust with a relatively low pressure and velocity against that which is to resist its motion. It requires but little calculation to show that the pressure, per square inch, on the paddles of a steamboat wheel is slight, in most cases not more than from two to four pounds. The buckets are moved at a velocity of 30 to 50 feet per second, or only a little more than double the speed of the boat. With these figures as foot-pounds, it is plainly seen that a large volume of water must be moved under like pressure and speed in order that the power may be absorbed which is used for steamship propulsion."

Another writer in the same journal suggests that "thrusts from a jet pipe made to act intermittently might produce greater propulsion results than a constant jet, which tends more to bore a hole in the resisting element."

Another suggests the use of the air to act as a sort of lubricant between the water and hull of a steamship, and thus increase the speed of a vessel, or lessen the power necessary to propel it. This has already been made the subject of a patent, and although it should not be regarded as related to jet propulsion, any further than as an aid thereto, it is nevertheless indexed in the patent office under that head.

A Brooklyn (N. Y.) engineer, Alexander Vogelaang, thinks the real loss in all jet propulsion has been—that as the direction of the jet has always been in a straight line in an opposite direction to the vessel's way, the jet cannot find a fulcrum close to the discharge to act against, except the peripheral part of said jet. It has occurred to him to use two or more jets, the nozzles pointing in an opposite direction to the vessel's way, and to make these jets revolve around a common axis in circular paths like the tips of a screw propeller. The object was not to allow the jet time to give velocity to the water acted upon and so to find a solid fulcrum for the entire area of the jet close to the discharge.

J. Barkitt Webb, at a late meeting of the New York Society of Mechanical Engineers, said that the subject of jet propulsion was one which is not ordinarily well understood.

Experiments had been made to prove that the reaction of a jet is the same in air as in water, to disprove a statement that a stream of water issuing from a nozzle under water reacts upon the surrounding water and tends to drive the nozzle in the opposite direction to that of the jet in the same way that a solid rod, issuing from the nozzle, would react upon a stone wall.

The tests were made in a large tank, and the water was supplied by a steam pump at a constant pressure of 100 pounds per square inch.

The nozzle was fastened to the foot of a pendulum four feet long and connected to the pump by a flexible half-inch rubber hose. The hose was hung by strings so that the stiffness was inappreciable. The pendulum at the nozzle was connected to a spring balance by a cord about four feet long. When the jet was flowing, the pendulum was brought to the vertical by moving the balance, and in this way every force due to the deflection of the pendulum was eliminated.

The pendulum was first hung so that the nozzle was a little above the water and the reaction found to be four pounds. The pendulum was then lowered so that the nozzle was about four inches below the surface of the water, all other conditions being the same, and the reaction was found to be the same—four pounds. The only difference was that when the nozzle was under water, the balance hand vibrated a little more.

Still, the general verdict of engineers is against the jet method of propulsion. Yet such verdict does not prove that the principle is wrong, or that it may not eventually be made a success. Let the principle be right or wrong, the community at large is in sympathy with it, and is living in hopes that both screws and paddle-wheels, that so uncomfortably chain up the ocean and jar the vessel to the discomfort of passengers, will eventually have to give way to the gentle and smooth action of jet propulsion.

A DIFFICULT ENGINEERING PROBLEM.—One of the most intricate, if not difficult, problems which Engineer Mantou of this city has of late had to contend with is a satisfactory solution as to how to most conveniently handle the large passenger traffic which is constantly crowding the foot of Market street in this city, seeking a safe passage to the various ferry steamers to Oakland, Alameda and Sausalito. How to move, with safety to the great crowd of foot passengers, the numerous street cars, which average fully one to every minute, is quite a perplexing problem. After many days, however, it seems to have been settled quite satisfactorily to all parties interested.

In the early days of steamships on the Atlantic, the steam pressure carried was five

pounds only, above the atmosphere, and the engines made from 10 to 12 revolutions per minute; the vessels made 8 knots per hour on an average. Now we carry exactly 36 times the pressure, make 7 times the revolutions, but go only 2½ times faster.

USEFUL INFORMATION.

Improved Mortar.

As the result of a long series of investigations, as well as practical tests, Prof. Baker, of Illinois, finds that a superior mortar, and remarkably non-absorbent, is obtainable by the addition of alum and potash soap. In this case, one per cent by weight of powdered alum is added to the dry cement and sand, the mixture being most thorough, and about one per cent of any potash soap—say ordinary soft soap made from wood ashes—is dissolved in the water used for mixing the mortar; the alum and soap combine and form compounds of alumina and fatty acids, which are insoluble in water, these compounds not being acted upon by the carbonic acid of the air, and adding considerably to the early strength of the mortar. With lime mortar the alum and soap have a slight disadvantage, in that the compounds which render the mortar impervious to water, prevent also the air from coming in contact with the lime, and consequently prevent the setting of the mortar, while, on the other hand, the alum and soap compounds add materially to both the early and ultimate strength of the article. As an evidence of the efficiency of such a compound, the fact is stated that the walls of the great Croton reservoir, in Central Park, New York, were rendered impervious by simply washing them four times alternately with alum and the soap solutions, the walls previously allowing the water to pass freely, it being also found that four coatings, that is, two pairs, render an ordinary brick absolutely impervious, even under a 40-foot head of water.

BURNING SMOKE is not such a modern idea as many suppose. In a book on the steam engine, printed more than 60 years ago, is the following: "There are cases in which it is of advantage to burn the smoke that issues from furnaces. As, however, when the fire is properly managed but little unconsumed matter will issue from a furnace of the ordinary construction, such plans are of very little value in making the heat produced by a given quantity of fuel greater. It is only then, when the smoke that occasionally issues when fuel is just added is productive of inconvenience to the neighborhood that furnaces of the kind [for burning smoke] need be erected."

CALIFORNIA DYES.—A new industry in the line of dyes is becoming of considerable importance to California. Lower California has long been noted for the variety of dyes which it produces, such as orchilla weed, etc., but the torotee tree bark, recently discovered, has come into great demand, and several large shiploads have been exported to Europe. As yet there seems to be but little demand for the article in the United States, although it is cheaper than orchilla and other dyes, producing in its natural state a dark red color, which is quite indelible. It is now collected and sold in this market at the price of \$1 to \$1.50 per 100 pounds, and the supply seems to be enormous.

A SIMPLE SUBSTITUTE FOR SEIDLITZ POWDERS.—A simple "foam," answering the same purpose as seidlitz powders, can readily be made at home. Take half a tumbler of cold water sweeten to taste and add enough vinegar to make it quite tart, about three or four teaspoonfuls, and none but pure older vinegar or that made from syrups should be used. Take another tumbler, put in three tablespoonfuls of water, dissolve in it a third of an even teaspoonful of soda, or sufficient to neutralize the vinegar; pour the two mixtures together, stir until it begins to foam, then drink quickly. You find it will make a pleasant beverage.

PLASTER OF PARIS.—It is said that from two to four per cent of powdered marshmallow root, mixed with plaster of Paris, makes it set more slowly, and so greatly increases its hardness when it has set, that it can be sawn, filed, and turned in the lathe. Eight per cent of the powdered root will retard the setting for an hour.

CELLULOSE is stated by the *Optician* to be totally unfit for articles requiring mathematical precision, although it can be put to many other uses. Its propensity to warp is far in excess of that of wood.

Two coats of boiled linseed oil makes the best varnish for new copper work. The first coat should be thoroughly dry before the second one is put on.

CORKS steeped in vaseline are excellent substitutes for glass stoppers. They are not affected by acids, and never become fixed through disuse.

ISINGLASS boiled in spirits of wine will produce a transparent cement which will unite broken glass so as to render the factor almost imperceptible.

ELECTRIC WANDS are now used in beating taming.

SAN FRANCISCO:

Saturday, July 25, 1891.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Hoisting Engines Built for the Tamarack Mining Co., Opechee, Michigan; Regenerative Coke-Ovens at Pinto Mine, Westphalia; Section and Plan of a Double-Bench of Coke-Ovens with Condensers, 49. Jig for preparing Large Coal at Collieries, 57.

EDITORIALS.—Regenerative Coke-Ovens, 49. Passing Events; Local Manufactures; Large Hoisting Engines; Reduction Works Wanted; Hydraulic Mining Conference; Jigs for Preparing Coal, 56.

MECHANICAL PROGRESS.—Power Without Fire or Steam; A Wonderful Mechanical Process; A New Phase in Steammaking; Boring Out Guns; Miscellaneous, 54.

SCIENTIFIC PROGRESS.—Improving the Phonograph; Recent Researches in Iron Formations; The Commercial Telephone; Sanitary Science; The Discovery and Utility of the Glass Lamp-Chimney; Crystals of Platinum; Miscellaneous, 54.

ELECTRICITY.—Wonders of Electricity; Edison's Kinetograph; Demand for Electric Motors; An Electric Oven; Miscellaneous, 55.

GOOD HEALTH.—Music as a Mental Tonic; A New Theory of La Grippe, 55.

ENGINEERING NOTES.—Jet Propulsion; A Difficult Engineering Problem; Miscellaneous, 55.

USEFUL INFORMATION.—Improved Mortar; Burning Smoke; California Dyes; A Simple Substitute for Seidlitz Powders; Plaster of Paris; Miscellaneous, 55.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 52-53.

MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 60.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 60.

MISCELLANEOUS.—Mining by Tunnel; The New Montgomery District; Production of Lead; Late Edward Burgess; Edison Incandescent Lamps; Pumping on the Comstock; Consolidated Virginia Dividends, 50; The Precipitation of Metals from Hypophosphite Solutions; Iron on the Pacific Coast; What is Forestry? 51.

Passing Events.

Gold mining excitements in three widely separated localities are reported this week. Placer mines near Bluefields, Nicaragua; quartz at Pine Nut, Nevada; and placers and quartz not far from Ellensburg, Washington, have each created great interest among prospectors in the respective regions.

Up on the Comstock, the people are more interested just at this time in pumping operations to free the lower levels of water than they are in prospecting new ground. Great hopes are entertained of what will be developed in the deeper ground of the various mines on the lode.

The iron-ore deposits of the coast are commencing to attract some attention. There are many of them, but few have been utilized. Those of Oregon and Washington have the advantage of fuel near by, while we have no good coals in California suitable for working iron. The works to be established in San Diego are looked to with great interest, since if they are successful, others will be built at other points.

GOLD IN WASHINGTON.—A dispatch from Ellensburg, Wash., states that there is great excitement over the gold finds in Menatash canyon, 15 miles from there. Many prospectors are starting for the fields.

THE Powder companies are getting plenty of nitrate from Chile, although there was a fear at one time that there would be difficulty about it. Ships go from here loaded with provisions and return with cargoes of nitrate.

Local Manufactures.

We published last week the assessor's list of manufacturing establishments in this city. The number of these, according to the assessor's report, was 996, while the census of ten years ago gave the number of local manufactories as 2971. Comparing these figures, there is apparently a great falling off in local manufactures. But the fact is, there are 4182 factories of various kinds here, as we find from the figures of the local census agent. This latter official had 15 men at work for five months, and he finds the actual condition as follows: Number of establishments, 4182; number of hands employed, 40,000; total annual value of product, \$143,000,000. The assessors figures for the same year show 27,570 hands and \$103,310,600 product.

Of course the census agent's work was thoroughly done and that of the assessor was only incidental. The census included every factory or place where any product was made, while the assessor ignored small establishments run in the rear of stores, in dwellings and rooms. But the variance in the figures shows that a number of small factories greatly increases the number of hands employed, and increases by nearly one-half the total value of the annual product.

We find then that 4182 factories employ 40,000 hands and produce \$140,000,000 annually. This state of affairs will give San Francisco a good standing among the manufacturing cities of the Union. The previous census gave it a high rating, and its percentage of increase for the last census should raise it still higher in the scale.

While we have not the advantage of densely populated contiguous territory, or numerous competing railroads, as have some large Eastern cities, yet the standing of San Francisco as a manufacturing point is satisfactory. We shall await with interest the publication of the details of the census report on manufactures, so that this point may be compared with others.

Large Hoisting Engines.

The illustration on page 49 shows one of the late designs in hoisting engines, manufactured by the Edward P. Allis Company, Milwaukee, Wis. This hoist was made for the Tamarack Mining Co., Opechee, Michigan. The drum on this special machine is 30 feet in diameter by 11 feet face. The steam cylinders are 42 inches diameter by 84 inches stroke. Both cylinders have Corliss valves with Reynolds' automatic cut-off. This gear is so attached that the cut-offs are inoperative when the engines are starting a load or moving slow, but they can be instantly applied at any time by the operator, and by their use perform a given amount of work with an appreciable saving in steam and fuel.

The valve gear is driven by a lay shaft located alongside the engine frame and operated by gears from the drum shaft; to it is attached the steam reversing gear of a novel design and simple form. A brake band is located at each end of the drum; these bands are operated by a patent steam and gravity gear, by which arrangement the brake pressure can be varied as required, and the brake always applied, even though the steam supply to the engine should be cut off.

All levers for handling the engine in either direction and operating the brake mechanism are located on a raised platform near to the miniatures which show the location of the skips or cages in the mine shaft.

The manufacturers can change the sizes of the cylinders and rope drum to fit the requirements of any mine, and preserve the general plan as shown by the illustration.

MINING LAWS.—Stewart's Mining bill only passed one branch of Congress, last session, so did not become a law. So there is no change in the time or date for annual assessment work. The Stewart bill would have changed the date, but as stated, it did not become a law. The Government mining laws are to-day just the same as they have been for some years past. This has previously been stated in the PRESS, but the question is repeatedly asked by miners who think the date for assessment work has been changed. It has not.

THE Morning Star drift gravel mine is paying dividends of \$2.50 per share on 2400 shares. The mine will soon be run night and day.

Reduction Works Wanted.

There are miners in Northern Arizona who honestly believe that railroad people do not care to see general quartz reduction works at Kingman, Mohave county, and Prescott, Yavapai county, the mining centers of the section. We have sometimes thought that way, too. The idea appears to be that the railroads, especially the long ones, believe that the starting of reduction works would lessen freight—deprive it of business.

This, miners and others deny. We deny it. Were these first-class works in this section miners could handle ores of less value than are now handled. Thousands instead of hundreds of tons of ores would be mined and worked; miners and others would be more numerous and the roads would profit by the change or changes. The miners and the Courier may be mistaken in these matters, but we doubt it. Think of this business, Messrs. Railroad Managers.—Prescott (A. T.), Courier.

This opinion bears out the remarks made on the subject in the MINING AND SCIENTIFIC PRESS of last week. Quartz reduction works are needed at all the mining centers of this coast, and they would be operated with profit were it possible to obtain the ores from the various camps at reasonable rates. There is plenty of ore and there would be more, but under the present condition very little, comparatively, is shipped. The ordinary low-grade ores will not bear shipment with high freight charges.

As we stated last week, some of the roads have built up an extensive ore business by placing the charges low enough to encourage mining development. This has been the means also of building up extensive reduction works at points on these roads. The railroads in California, Nevada and Arizona have pursued a different policy, and have given no encouragement to the mining communities. Poor ore cannot be shipped, and the richer the ore, the higher the freight charges.

It is in the power of these roads to create a demand for ores at reduction centers; to establish reduction centers, and to build up the mining camps. But thus far they have shown no liberal disposition. It is our belief, based on the experience of interior lines of roads, that a more liberal system of charges would, in the end, redound to the benefit of the roads as well as to the miners.

It is not, as we have previously stated, the city of San Francisco alone, which would derive benefit from more reduction works, but such places as Kingman, Prescott, and others. They would all get more or less business which the miners would send them. There are hundreds of miners owning claims which would be profitable if the ores could be shipped to a distance. But most ores will not pay when excessive freight charges are added to the cost of mining and reduction. The freight is often higher than the other two combined; as a result the mining industry languishes. It is to be hoped that the railroad people will give this subject an exhaustive examination and afford some relief from present conditions.

Hydraulic Mining Conference.

A number of citizens of Iowa Hill, Placer county have, through a committee petitioned the Sacramento county Supervisors, to withhold its proposed action to procure permanent injunctions against the Iowa Hill mines, until they make a personal examination. A number of business men of Sacramento also presented a petition asking the supervisors to pay heed to the Iowa Hill petition, and visit the mines so as to act advisedly.

It will be remembered that once before an Iowa Hill mine was enjoined through a misrepresentation of facts, and when the Supervisors personally viewed the premises they caused the injunction to be removed.

The Iowa Hill petition sets forth that the local supply of water is very limited and the periods within which the several companies are engaged in hydraulic mining does not exceed 60 days each season, and that the gravel is coarse and cemented so but a small quantity can be removed. Among other reasons advanced are the following:

That the gravel and debris from the said hydraulic mining flows into Indian canyon, a tributary of the North Fork of the American river, and is deposited in said canyon at a point about seven miles above the junction of said river. The said canyon, having a very light grade, nearly all of said gravel and debris so deposited in said canyon remains there indefinitely, not affected by any winter freshets, as the head and source of said canyon being but about four miles above the point of said deposit, the area of drainage into the same is very small; and as most of the heavy storms are accompanied with snow at the head of said

canyon, which, within a mile of the head, rises quite abruptly to an altitude of about 1200 feet above the point of deposit of said gravel and debris therein, the accumulated water does not have any material effect in the removal of said gravel and debris from said canyon.

That the hydraulic mines in this section have of late years been worked in a limited manner with small heads of water and but a short period of time each season, the gravel being coarse and heavy (the lighter deposits having been previously removed) the gravel remaining is small in quantity, and of such a character that the damage to arise from the working and mining the same would not be appreciable.

That there is a considerable area of bedrock in the several mines covered with heavy, coarse gravel of a depth of from two to ten feet which contains considerable gold, and which could be mined off without causing damage to any party or parties situated below.

The petition concludes as follows: Wherefore, in view that the matter at issue may be fully understood and may be adjusted without resorting to expensive and vexatious litigation, we would earnestly and respectfully request that your honorable body visit this place at the earliest moment practicable, and by personal observation and inquiry inform yourselves of all the facts relating thereto, to the end that the order enjoining the mines of this section from working be dismissed or modified, as from a full knowledge of the attending circumstances may to your honorable body seem meet and proper.

The supervisors have decided to visit the scene of operations at Iowa Hill, accompanied by an attorney and a surveyor.

This is a common sense thing to be done. If litigants could be brought together in this manner oftener, there would be less for the courts to do. These supervisors, after seeing the ground, can act in the premises with knowledge far beyond that acquired by reading the reports of splea or other interested parties. If these miners can do as they say, and get out their gold without appreciable damage, they should be allowed to do so without interference.

Jigs for Preparing Coal

The jigs used for the large coals at the Cross Creek collieries, of which there are 12 in the breaker at Drifton, Pa., are a modification of the Luhrig Jig. They may be divided into two parts, the upper being the machinery for moving the piston, and the lower the jig proper. In constructing them a tank is built long enough for the number of jigs desired. This is made water tight on the outside, and divided by partitions which need only be approximately water-tight, as there is water on both sides of them. The jigs are built in pairs, being about 5 feet wide and 6 feet long, so as to give a piston 5 feet by 3 feet. Pulley (43), (See engraving) is a heavy fly-wheel pulley, and is driven by a pulley on the line-shaft of the jigs. The jig-pulleys are all alike, and the pulley on the line-shaft is arranged so as to give the proper speed to the plunger (40). Through the pulley (43) passes the counter or driving shaft (49), at each end of which there is a crank-disk (45), the crank-pin (48) being so arranged as to slide from the center outward. By thus sliding the crank-pin (48), the stroke can be increased from nothing to 6 inches. Around the crank-pin there is a square block (47), which slides in the slotted arm (44). As the crank-disk revolves it gives the slotted arm (44), which is on the shaft (50), a motion like that of a pump-handle, which is communicated through the shaft to the two plunger arms (46), connected with the plungers (40). In consequence of the sliding of the crank-pin in the slotted arm, the motion upward of the plunger-rod is at a different rate of speed from that downward. The object of this is to force the plunger rapidly down, lifting the coal quickly, and allowing it to settle slowly. By running the fly-wheel pulley in the opposite direction to the hands of a watch, this effect is produced, the piston descending more rapidly than it ascends. The jigs are arranged in such a way that, while the piston of one jig is rising, that of the other of the same pair is falling. This diminishes the shock upon the machinery, since, to a certain extent, they counterbalance each other.

As the principal work is done in forcing the plunger downward, the plunger and plunger-rod are made very heavy, thus equalizing, more or less nearly, the work during a revolution. The lower part of the plunger-rod (41) is made of cast-iron, the upper part of two wrought-iron straps (42), which are welded together on top and are kept apart by a piece of wood which is bolted between them.

JIG FOR PREPARING LARGE COAL AT COLLIERIES.

It goes either to the picking chutes to be picked, or directly to the pocket, if it is (as in the case of the small sizes) already clean enough. The opening (10) through which the slate passes is regulated by elevating or depressing the plate (31), so arranged as to allow the largest piece of slate to pass under it. To the left of this plate (31), the bottom slopes in all directions to the gate (11), which generally remains open, but which can be closed by the lever attached to the bell-crank (17). Outside of this gate is a cast-iron flat pipe or slats-hopper (9), which is closed by the wedge-shaped slide (15), upon the upper surface of which is a piece of oak (14). Slide (15) moves in a casting (13), which has on each side a taper groove. When the slide (15) is pushed through this opening in (13), the wedging action of the taper grooves forces the wood against the face of (13), which is planed and bolted to (9). This makes an excellent gate for closing the hopper, allowing neither water nor slate to escape. If the closing is not perfect, on account of something catching in the slide, it is simply pulled back again. A similar arrangement at (19) and (20) lets out the slime and fine coal which accumulate in the bottom of the jig. The gate (11) is closed by forcing it up on the frame (10). This cuts off both the water and slate from the hopper.

When this has been done (15) is drawn out, and the water and slate fall upon the inclined plane (22), and slide down to a point over (27). Here the water drains into the drag-trough (29), and the men who stand at the right of (23) pull the slate over the edge of (23), allowing it to drop on to (24), and thence into the drag; while whatever coal may have come out with the slate is picked out and run, either directly to the pocket, or placed in boxes and carried there. At about the water line of the jigs there are holes cut through the wooden partition, so as to allow the water to flow from one jig to the other, and thus maintain a uniform level. The jigs are managed as follows:

One or more men, according to the number of jigs, are placed between the timbers overhead carrying the running mechanism and the top of the jig. It is their duty to see that the water is kept at the proper level, that the jigs and draws are working properly, and that the coal is uniformly distributed to the different jigs. The men who manage the other part of the jigs stand at the right of (24), and, by means of the lever (21) discharge the slime at the bottom. When too great a quantity accumulates in the tank, they close the gate (11) by means of the lever (19), and allow the slate to come out by means of the lever (16). As the slate is taken out, it is inspected; the coal is taken out, and if the jig is not working properly, as shown by the slate discharge, they notify the foreman in charge of the jigs. The man on top is also to see that the coal coming out of the jig is as clean as can be expected. If too much slate comes with the coal, there is something wrong with the jig, and it is his duty to notify the foreman.

The shaft (53) which drives the elevators, is continuous along the whole length of the jig house. The arms (35), which support the sprocket wheels at the lower end, are so arranged at the upper end (36) that they can be lifted up and turned around the shaft, so that if necessary (as if the coal for any reason should accumulate at the bottom) the sprocket wheels (34) can raise themselves or be raised without causing the stoppage of any of the rest of the machinery.

STOCK IN MINES FOR SALE.

Dividend-paying Mines from \$150,000 up.
Undeveloped Mines from \$10,000 up.
Undeveloped Mines on Bond.
Stock in Dividend-paying Mines from \$1 up.
Stock in Undeveloped Mines now being opened from 25 cents up.

All situated in the GRASS VALLEY MINING DISTRICT, the Oldest Quartz Mining District on the Pacific Coast, and the Richest and most Permanent in the World. The mines of this district are practically inexhaustible, as nearly half a century of constant working is proof. Grass Valley has the deepest regular dividend-paying gold mines in the world, and the end is not yet, for these same mines are as rich to-day as at any time during their history.

Gold mining, especially in Grass Valley, when under honest and scientific management, is one of the safest and most profitable of all American industries. It is a business that will return annually a profit of from 100 to 300 per cent on the investment. Mining is a science acquired only by years of study, combined with practical experience. Therefore, failure is the rule whenever the management is ignorant and unscientific.

The undersigned is a practical scientific and successful miner, has made mining a life study and vocation, is honest and trustworthy, and will not, under any circumstances, recommend or deal in any but valuable paying property and properties that will develop dividend-payers.

No Wildcat Mines; no Sharp Practice; no reasonable chance for loss; Honesty and Square Dealing Guaranteed. Correspondence solicited.

Full particulars by applying to

S. B. FOWLER, Supt. Hartley Mine,
Grass Valley, Nevada Co., California.

THE RUSSELL PROCESS.

EGBERT JUDSON, THOMAS BELL, J. B. RANDGL, JOHN S. DGE, ED. G. LUKENS (President).

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY, UNEQUALED IN EFFICIENCY, UPWARD OF 3000 NOW IN USE.

Will do more than twice the work of any other with the same cost in wear.

Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

THE PELTON WATER WHEEL CO., 121-123 Main Street, San Francisco, General Western Agents.

WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS.

More than DOUBLE THE CAPACITY with One-Half Less Power and Occupying Less than One-half the Space of any other Concentrator.

Built of Best Steel and Wrought Iron.

STRONG AND DURABLE.

Price \$575 f. o. b.

Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectually prevents the edges from cracking; plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

PATENTED Aug. 13, 1890.

GEO. E. WOODBURY, Man'r, 213 to 219 First St., San Francisco.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAM PLATES for SAVING GOLD In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

“TRIUMPH” ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the “Triumph” Ore Concentrators, the “Frue” Vanners and other forms of concentrating devices, do not warrant the assertion that the “Frue” Vanner is the best ore concentrator in the market. The fact that the “Frues” have improved (corrugated) belts does not militate against the superiority of the “Triumphs,” for, when desired, they (the “Triumphs”) can be mounted with a superior belt known as the “Blasdel” Riffled.

Price “Triumph” Concentrators, with Im-
proved (Patented) Belt . . . \$650 f. o. b.
Price “Triumph” Concentrators, with
Plain Belt . . . \$550 f. o. b.

We are prepared to guarantee the superiority of the “Triumph” over the “Frue” or any other form of Concentrator, for coin it need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

Location of Works, Grass Valley, Nevada Co., Cal. }
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the “Triumph” Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrator is the equal, if not superior to any other style of Vanners or concentrating devices.

DAVID McKAY, Jr.,
[Signed] Sup’t North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more “Triumph” Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE BLASDEL

CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevent it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailing from a belt, the surface of which is entirely smooth.

A New Electric Road.

The driving of the last spike of the San Francisco and San Mateo electric road was accomplished with appropriate ceremonies on Wednesday, and as the first electric road on the San Francisco peninsula, marks a new era in railroad development in this State. The point where the silver spike was driven is at the county boundary line, near Ocean View. The new road begins at Stenart and Market streets, within a minute's walk of the ferries, and runs along Stenart to Harrison, out Harrison to Fourteenth, across Fourteenth to Guerrero, out Guerrero to Thirtieth, where it turns into San Jose avenue; out the San Jose road past Ocean View, where Wednesday's ceremonies took place, into San Mateo county, and on to Colma and the cemeteries. Here the present construction ceases, but the road will be continued on down to San Jose via Redwood City.

The first $5\frac{1}{2}$ miles of the road is of double track, but when reaching the sparsely settled regions a single track is used. The last portion of the road has T-rails of 40 pounds to the yard, made of Bessemer steel by the Pacific Rolling Mill Co. of this city. The rails down town rest on wrought-iron chairs, under which the ground wire runs.

The center-bearing rail, made use of in the city, is technically known as the "girder" rail, and is remarkable for its strength. The quantity used in the construction of the road through the city was 1,680,000 pounds—750 long tons of 2240 pounds, or 840 tons of 2000 pounds. The length of a girder rail is given as 63,360 feet. The quantity of steel T-rails, 40 pounds to the yard, used, was 840,000 pounds, or 375 long tons of 2240 pounds. In short tons of 2000 pounds this is 420 tons. The girder rail and T-rail divide Sec. No. 1 into two subsections, each 32,000 feet long.

The engine power used will be from the power house in Sunny Side, as already stated. Two of the engines will be of 500 horse-power each and one will be of 250 horse-power.

From Stenart and Market streets to the cemeteries in San Mateo county—Section No. 1 of the road—the total distance is 64,000 feet—12 miles and a furlong. Between 50,000 and

IMPROVED TRIPLE-GEARED SHAPER.

60,000 ties have been used. Under these ties has been placed wire aggregating 200,000 feet—38 miles of wire. This ground wire is of copper No. 2 size. The total length of wire overhead is over 76 miles, or to be accurate, 402,060 feet. The trolley wire is No. 0, the feeder

wire No. 1 and the span wire is five-sixteenths of an inch in diameter.

The road will open up a large tract of land along its line, and furnish convenience of travel to an extensive section. When completed it will be one of the largest electric

roads in the country. The officers of the railway company are: Behrend Joost, President; J. H. Gilmore, Treasurer; J. W. Hartzell, Secretary and General Manager. These, with Fabian Joost, form the Board of Directors. The construction and management of the road have been made under the personal supervision of J. W. Hartzell.

This new road will be of great benefit to San Mateo County, which has grown very slowly in population notwithstanding its many advantages and its nearness to San Francisco. Quicker, more frequent and cheaper transportation is expected to result, which should build up the suburban residence district of the county.

On the occasion of the driving of the last spike speeches were made by J. W. Hartzell, H. P. Bowle and Wm. M. Bunker, of the *Daily Report*. The latter gentleman, in his elaborate speech, gave an interesting resume of the progress of electric railroad work in this country. He has recently visited the north-west and witnessed the development brought about by the electric roads there. Intelligent observation convinced him of the great possibilities of these roads of improving certain sections in this State, not only as carriers of passengers, but of freights as well. The address of Mr. Bunker gave an excellent idea of the existing conditions with relation to electric roads.

Geared Shapers.

An engraving on this page shows an improved triple-geared shaper, which is made in 20, 26 and 32 inch sizes. In designing this machine, great care has been taken to give ample stiffness to resist strain of cutting tool. There is also a much greater range in every way than is usually furnished with a tool of this kind.

The vertical adjustment table is made with worm and wheel, operating a pinion working into a rack, and is raised and lowered at the same end of cross-head at which the operator is standing. This enables him to make every movement necessary in working the machine without altering the position or even stopping the shaper. This will be recognized as a great saving of time where a large variety of work is being done, or, in fact, under any circumstances. There is an open space under the ram that admits long lengths of iron clear through, and is very convenient in cutting key ways in shafts of any length, and up to three and one-half inches in diameter. The cutter bar or ram is driven by two bull wheels of large diameters, operating in double racks. The driving pinions are of steel, cut on the solid shaft. A counter-shaft is furnished with two changes of speed, and back motion is made two to one. In these machines, for which the Parke & Lacy Co. of this city are agents, the workmanship and material are of the best.

JOHN A. MARION, editor and proprietor of the Prescott (A. T.) *Courier*, dropped dead on the porch of his residence on Monday last. Deceased worked on various papers in this State 30 years or more ago, and has been a publisher in Arizona since 1864. He made a first-class paper of the *Courier*, which gives the best local news of any paper published in the Territory.

ELEVATION OF CONDENSING AND PURIFYING APPARATUS FOR BY-PRODUCTS FROM COKE-OVENS.—See Page 73.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Our Mining Interest and the World's Fair.

EDITORS PRESS:—Your criticisms on my article, wherein I stated that \$50,000 of the State's appropriation of \$300,000 should be set aside for the mining industry, must not be passed unnoticed. I have delayed answering from the fact that when I come to review California's interest in her mineral wealth, as illustrated by her legislative, judicial and business men's course, I see such a niggardly disposition displayed that I have taken on a good deal of the apathy of which you speak, as being the case with miners generally. No wonder they have no desire to spend their time in any public spirited way. The more they seek to build up, the more is the effort to break their enterprises down; yet the miner can stand this better than any other industry. He has his mine, works it, and don't have to go hawking around to get rid of the product of his labor. He don't care individually whether California has a good mineral display at Chicago or not; at the same time has a State pride, and with proper recognition of his rights will do his part every time, even to his own injury. The niggardly course pursued for the past ten years toward the mining interest of this State has cost the people many, many millions of money. The frequent judicial proceedings—the general cry against special mining operations—has put a stop to many a venture; no foreign, Western or Eastern capital comes to California as in the past, or as goes now to Colorado, Utah or Montana. Only a few days ago the S. F. press heralded the following, which shows the truth of this assertion:

CHICAGO, July 8.—Albert Verillon and C. Bourbon, French mining engineers, are in this city, en route to Utah. M. Bourbon said large amounts of French capital were ready for investment here as soon as the possessors of it are convinced that their money would be safely placed. To this end, Bourbon added, himself and companions were going to Utah and Colorado to inspect certain well-known mining properties. They would make reports upon them that could be relied on upon the Bourse. This was made necessary by the numerous wild-cat reports which were abroad in Paris about American enterprises.

When it comes to our San Francisco capital, there is so little of it for mining and so much out at "cent per cent" that it is fooling away time to undertake to interest it in mining developments. The result is, that what the people want (more money) they don't get, as in the past. It is not produced, and there is no encouragement for opening new mining properties.

In your issue of July 18th you say: San Francisco ought to have the Swansea of America, but is not. Why? Not altogether on account of railroad rates. Take your largest works—the Selby smelter—located handy, as you say, for ores from Mexico, Central America, British Columbia, Washington, Oregon and Alaska. Railroad rates don't effect any of the foregoing; California, Nevada and Arizona it does. Now, with all this vast field to work upon, the Selby smelters could be put in the back yard of either the Hill, Grant or Pueblo smelters of Colorado, and they have no such a field to work in. So it is not railroad rates altogether; it is the lack of business mining spirit of our own people. California in August holds an immigration convention, the ultimate of which is to send out flaming circulars that will mainly be distributed by labor agents to induce more pauper labor into the State, which simply becomes a dead weight, reduces wages, makes the rich richer and the poor poorer. In September, Colorado holds at Denver a mining Congress in which her Boards of Trade, Chamber of Commerce and representatives from all parts of Colorado take part. The subject-matter of this Congress is not for inducing immigration, but to see what she can do to advance her mining interest, to build up and enrich her present population and what she will do at Chicago (which will be what California is not yet able to approximate).

As regards my opinion that the California mineral exhibit for Chicago is only wanted for a cat's paw, I see nothing to change that view. I see the move to have an exhibit and the smallest outlay possible for it, no matter what is the damage, by moving the State University and Mining Bureau collection. You say the Commissioners have not even considered the matter of the mineral collection; this but strengthens my position, that they propose resting on the two collections above named. If they have not given the matter any thought or attention, then I will say it is time they did, for no interest requires so much time as getting together and classifying a mineral collection. I will be pleased to have their work prove my views all wrong. We will see. My proposition, as published in the PRESS some months ago, was for California to put forth her best efforts to make a fine collection of all belonging to the mineral kingdom, and have it understood with the donors, that after the fair was closed, the entire collection be donated to some public institution of Chicago, that would agree to keep it open for public inspection. Thus California would have a continuous exhibit for the inspection of mining investors from the East,

West and Europe, when visiting Chicago. The University and Mining Bureau no doubt have many duplicates that could be spared, and thus save the breaking up of the main collection. There are many private collections obtainable, all the latter being made returnable. My entire interest in this matter is to see something done, while up to this date nothing, you say, has been.

I have spoken of the niggardly treatment by California of the mining interest of the State. We have only to review her acts for the several World's Fairs to see it. We will start with the Centennial at Philadelphia in 1876. From official reports I list as follows:

Commended, for a spacious building, containing special woods of the State, also a fine exhibit of the natural resources of the State, animal, vegetable and mineral, made for the citizens of California by the Land Department of the Central Pacific Railroad Co. The railroad did it, not State pride.

Next on the list comes the Paris Exposition of 1878. For making the California exhibit for this, there was a long array of names, with but few workers. A collection was made, however, by the united effort of four individuals, who soon found they had expended some \$300 of their own funds, with not a cent in the treasury, and but for John W. Mackey, California would have been unrepresented at the Paris Exposition. Mr. M., being informed of the position of affairs, drew his check for \$5500. The State of California or business men of San Francisco did not pay \$100. The whole labor of the collection, which took about seven months to make, fell upon Henry G. Hanks, Melville Atwood, Solomon Heydenfeldt Jr., and your humble servant. A fine collection was made, a large number of the specimens being donated by and from the cabinets of the before-named parties. After the fair was over, this collection was donated to the School of Mines of Paris, and in the name of California, and the following was the acknowledgment:

VERSAILLES, Feb. 4, 1879.
Henry G. Hanks, Superintendent of Minerals.—Sir:—The Director of the School of Mines has informed me that the State of California has very generously disposed by gift in favor of this school of the very valuable and rare collection of ores, rocks and minerals from the Pacific States, which was on exhibition at the Exposition Universelle 1878. I desire you sir, to express my sincere acknowledgment to the Government of the State of California for this act of liberality. I also wish at the same time to return you my thanks for the obliging assiduity with which you have represented your Government in this affair. Receive, sir, the assurance of my highest consideration.
DE FREYCINET.

California received the credit at once. In 1880, the Legislature passed a joint resolution, thanking Mr. Mackey for his \$5500 donation, but our dignified legislators did not have State pride enough about them to appreciate Mr. M.'s liberality by refunding him the money as they should have done.

Next comes the Mineral Exposition at Denver, Colorado. Mr. W. B. Ewer (senior editor of your PRESS) was appointed Commissioner, and invested with rights to represent the State (at his own expense). Colorado had devoted a large space to California with Mr. Ewer (at his own expense) to fill it. California had nothing in her department, while all other States and territories were represented.

Next comes the New Orleans Exposition of 1882. For this exhibit, California appropriated \$10,000 and appointed as Commissioner a man no way identified with the mining interest, and as the Southern Pacific railroad footed about all the bills, some of this money was returned to the treasury. The space set aside for California was larger than for any State except Texas, and report says was creditably filled; for this the credit goes to the Southern Pacific Railroad Co., not the State of California. To this exhibit the Mining Bureau collection was taken. Henry G. Hanks, at that time being State Mineralogist, refused to move the collection without authority of the Legislature, which was obtained—Mr. H. going with and supervising the collection.

I could go still further, but this will suffice to show up how little California has done. She has been very lavish in appointing Commissioners, but very careful that they cannot creditably represent the State. She is now reaping the evil of her parsimony by having capital to pass her by. California has no consideration away, and it is this condition of things in which we want a change. It is not to injure any other interest that I say mining should have \$50,000—one-sixth of the appropriation. Are there five other interests in the State greater than mining? Is the demand unreasonable? The amount should not be foolishly expended, but judiciously handled, for the full showing up of all our mineral wealth on a grand scale, that we may draw to the State more capital for the production of more gold and silver, for the good of every interest and every individual.

ALMARIN B. PAUL,
Middle Creek P. O., Shasta Co., July 14.

Freight on Ores.

EDITORS PRESS:—The article in your issue of the 18th inst. is timely, and it is true in every particular. There is no doubt that, with politics, I will not say decent, railroad rates, large reduction works could be built up around this bay, and the same could be said of many other industries; but there is no likelihood of

the one railroad company we have ever building up anything but themselves. If they would ever do this in a becoming manner it would not be so bad, but I hear on all sides the freight service is altogether inefficient. I know as my own experience in the last several years that if I go north, east or south, on a sudden trip, I can never get a sleeper, but am forced into a rear train to pass the night among emigrants or Chinamen. Regard this as in parenthesis, and to return as to how they encourage mining. Certain parties not long since decided to put in reduction works at G—, not more than 160 miles from this city. In all the preliminary operations the railroads were like silk, charmed, delighted to have them inaugurate such an industry in their midst, and would afford them every facility in their power, and they did till the works were built and the parties' money was sunk in the ground and they could not help themselves. Then it was a case of the fly heaving walked into the little parlor of the spider. A preparation of soda necessary in their operations that cost \$2 a ton in San Francisco cost \$19 a ton to deliver at their works less than 200 miles away, and the railroads were responsible for all but a dollar or two of this. This is but a single sample, perhaps, of extortion practiced on most every article used, not only in these works, but in every other in the State where they have customers at their mercy. No, I hardly indulge the hope we will see a Swansea on the shores of San Francisco bay just yet; we will have to wait for that until the people who built these railroads wake up to the notion that it is about time to take their own property back.
T. D.
San Francisco, July 25, 1891.

The Precipitation of Metals from Hyposulphite Solutions.

(Continued from last issue.)

[Read by C. A. STETTER, of San Francisco, before the American Institute of Mining Engineers.]

§ 2. Formation of Hyposulphite Salts.

The reactions taking place in boiling caustic soda with sulphur are expressed by the equation:

This is to say, for two equivalents of a sodium sulphide, one equivalent of the hypsulphite salt is formed.

For the formation of different sodium polysulphides, the quantities of sulphur consumed would be as follows:

100 c. p. caustic soda require c. p. sulphur.	100 caustic soda, with 30 per cent NaHO, require sulphur with 95 per cent S.	For the formation of
53.3	50.5	Na_2S
80.0	75.8	Na_2S_2
106.6	101.0	Na_2S_3
133.3	126.3	Na_2S_4
160.0	151.6	Na_2S_5

In manufacturing sodium sulphide there are no very important side issues to the reactions expressed by equation No. 1; and, taking into consideration the impracticities of commercial caustic soda and sulphur, calculations for practical purposes can be based upon them. There are, however, certain limitations to the equation. It is not true, for instance, when $x = 1$. In using an amount of sulphur only sufficient for the formation of Na_2S , caustic soda remains free, and polysulphides are formed besides Na_2S . It is even difficult to obtain a reagent absolutely free from caustic soda by using enough sulphur to form Na_2S_2 . Such a solution is also liable to contain some Na_2S and polysulphides higher than Na_2S_2 , a tendency prevailing to form the higher polysulphides. If we replace in equation No. 1 sodium by calcium, the reactions become still more complicated. In the first place, the equation is only true for CaS and CaS_2 . It is very probable, however, that some sulphhydrates are also formed, and this seems the case even in preparing sodium sulphide. I will here draw attention to the fact that H_2S frequently escapes at the end of precipitation, even if the solution has originally an alkaline reaction. This is the case in using both calcium and sodium sulphide as precipitants. The formation of H_2S can be easily explained if we assume the existence of enlyphides. The reaction would be as follows: $\text{Ag}_2\text{S}_2\text{O}_3 + \text{CaH}_2\text{S} = \text{Ag}_2\text{S} + \text{CaS}_2\text{O}_3 + \text{H}_2\text{S}$. Naturally, the H_2S only escapes when precipitation of the metals is nearly completed. This also explains an observation made by Russell at the Marsoe mill.

He says: "The solution running from the ore-vats to the precipitating tanks is perfectly neutral, but after precipitation with sodium sulphide, it is so acid that blue litmus-paper is instantly reddened by it. At the end of precipitation, the odor of H_2S is very perceptible; it even appears during precipitation if stirring is not well done."

This, it seems to me, shows the presence of enlyphides. The H_2S formed in the beginning of precipitation is absorbed by the solution, throwing down metals and setting acid free. To return to the calcium sulphide:

The reaction is also disturbed by the formation of oxy-sulphurets, which are not easily soluble, especially if sulphur is not used in excess to form CaS_2 , and by decomposition of calcium hypsulphite at boiling point. While a sodium hypsulphite solution can be

heated to boiling without detriment, that of the calcium salt decomposes above 60°C . as follows:

This decomposition is, however, resisted in the presence of C. S_4 and CaS_2 , and counteracted by the opposite reaction:

Which takes place between 30° and 40°C , that is to say, after cooling and setting of the solution. To what extent these opposing reactions balance each other is not known, and depends, most likely, upon various circumstances.

For these reasons it is not possible to calculate beforehand, even approximately, from the chemicals consumed, the effect of a calcium sulphide solution in precipitation, or to compare it, merely by calculation, with the same effect of a sodium sulphide solution. Only actual mill statistics make a comparison between the two reagents possible. It can readily be seen, however, that the preparation of CaS_2 must involve a waste of chemicals compared with that of Na_2S_2 .

According to equation No. 1, 100 parts of caustic soda, consumed in the manufacture of sodium sulphide, will produce 103.3 parts of $\text{Na}_2\text{S}_2\text{O}_3 + 5 \text{ aq}$.

Or 100 parts commercial caustic soda, containing 90 per cent NaHO , would produce 93 parts $\text{Na}_2\text{S}_2\text{O}_3 + 5 \text{ aq}$. Both sodium and calcium sulphide solutions, if exposed to the air, oxidize with formation of hypsulphite salts, but the latter more rapidly than the former.

In case Na_2S is exposed to the atmosphere, sodium hydrate is formed besides hypsulphite:

The caustic soda is then converted into carbonate by absorbing carbonic acid from the air. Na_2S_2 is completely converted into hypsulphite, while the higher polysulphides are oxidized with precipitation of free sulphur.

O. Hoffman, who used CaS_2 as precipitant at the Silver King mill, Arizona, stated to me that the original stock solution was used over a year and a half, and that it increased in strength and volume, making it necessary to run a part of it to waste.

In this case a large amount of copper and lead was precipitated with the silver. This is good evidence to show how rapidly CaS_2 oxidizes. What has been said about the more rapid decomposition of calcium sulphide in contact with air, compared with sodium sulphide, holds good regarding the respective hypsulphite salts.

Russell exposed solutions of different concentration in soap-plates to the atmosphere for seven days, at a temperature of from 20° to 22°C , and brought them to their original volume at the expiration of that time. The relation of the depth of the solution to the diameter of the plates was about 1 to 8. The deterioration which had taken place was for sodium hypsulphite, 1.4 per cent, and for the calcium salt, 16.1 per cent.

Formerly lixiviation-solutions were never heated; the new practice finds it profitable to operate with solutions of a temperature as high as 50°C . Would not the loss in calcium hypsulphite be much increased in such a case, when complete decomposition takes place above 60°C ? The stubborn advocates of the old practice in lixiviation say: We never needed to buy sodium hypsulphite; our stock-solution increased in strength, and we had to run it finally to waste! But at what expense, gentlemen, in caustic lime and sulphur, and inferior extraction in silver, did you reach this result?

(To be Continued.)

Results from Free Coinage.

In the course of a column letter on the effects of free silver coinage in the United States, William M. Stewart, Senator from Nevada, paints this rosy picture:

"Let either be restored and the volume of real money increased, and prosperity will follow as the light of day follows the rising sun. Prices will rise, and producers of wealth will be rewarded by the enhanced value of the fruits of their toil. The value of farms and farm products will be enhanced and agriculturists can pay off their mortgages, support their families and educate their children."

"Stocks will rise, the people will have money to buy them, and stock exchanges will be overrun with business in filling the increasing orders from people who will be encouraged to buy because the prices are advancing. Business will be active, and the merchants will prosper because the people are prosperous, and all who are industrious can supply themselves with the necessities and many of the luxuries of life, and pay cash on delivery."

"Even the aoid neurer will be benefited; the danger of loss by the bankruptcy of his debtors will be removed. Safe security will be ample at reasonable interest, because men of enterprise can afford to borrow money to invest in property and pay good interest when property is advancing in price."

JOSEPH HAMPTON was seriously injured by a cave in a mine at Jeckes Hill, Trolmeire Co., on Friday of last week. He was working by himself when a couple of tons of earth fell on him, and his whole body, save his head was covered up and painfully wedged in the earth and rock. He was thus confined for three hours, when a passer-by discovered his situation. A number of bones were broken and there is not much hope of recovery.

Gigantic Red Cedar.

Swelled bases to the trunks of our forest trees are not uncommon, especially to certain species of the great Cypress family, including the *Sequoia*.

Of course such swelling is a great detriment to a lumber tree, especially when accompanied by hollowness of the part, as often happens. The most inveterate sinner on this coast, in respect of egregious expansion and wind-filling interior, is exhibited by the Gigantic Red Cedar (*Thuja gigantea*), or Pacific Arbor Vita, of the forests of the Northwest.

But the hollowness of this tree is not excoriated in fifty felleets by the aboriginal inhabitants of the country. The Indian just chops down a tree, cuts it off at the proper distance, splits off the upper side, pines up the ends, and there is his canoe!

The Atlantic species of the same genus—*Thuja occidentalis*—is more inclined to have swelled bases than ours, while the Bald Cypress—*Taxodium distichum*—exceeds all other trees in this respect, the trunks being three or four times as large at base as they are at the height of 15 or 20 feet; and this is the tree which, in addition to hollow trunk, develops large balloon-like excrescences from the surface roots, called "cypress knees," and the subject of much speculation on the part of scientists.

But all the trees which are given to enlargement of the base are not also hollow-hearted. This is particularly true of the two species of *Sequoia*. Their bases are seldom empty barrels, but rather well stored huts of compacted material, arranged in buttresses that brace up a monster tree and enable it to carry up a columnar shaft to a great height.

But all the same, hollow or well stored with excellent lumber material, the big swell of a tree is not prized, and its owner is obliged to contrive means to climb above the enlargement before cutting his tree. Some build scaffolds to the desired height, others erect ladders against the trees, but the most used and ingenious method is shown in the illustration on this page.

This tree is a "swell," belonging to the Red Cedar species common about Puget Sound, and often met with along the streams on the coast as far southward as Cape Mendocino. The workmen menacing the tree with ax and saw are seen standing on planks, one end of which is fixed into the tree. These planks, about three feet long, are narrowed at one end and provided with a strong iron shoe or upturned grip. A hole is cut into the tree, the board inserted at an angle, the outer end depressed when the grip takes effect, and thus a staging is formed for the workman, who, however, must be level-headed to swing an ax on such a narrow perch, often at the height of 20 to 30 feet.

To cut off a tree above the swell is to save half the labor of cutting and to rid the owner of the irregular gnarled or burned out butt of his tree, but an Eastern citizen's first exclamation when visiting a redwood stump field is "What a waste!" This was the constant lament of the American Horticultural Society when visiting the noted Guerneville region three years ago.

They could not be convinced that stumps of solid redwood, as big as a four-room cottage, were worthless for timber—except now and then one which displays some peculiarity of curled or wavy grain.

As these stumps are well nigh indestructible, except by fire, there is here a reserve supply of timber which, in view of the fast disappearing forests, may be utilized by the coming economist of the Northwest.—J. G. Lemmon in *Pacific Rural Press*.

The Government Rain Racket.

We have previously alluded to the experiments soon to be made under the auspices of the Department of Agriculture to determine whether agitation of the air by explosions will be followed by rain. Congress ordered these experiments and appropriated money therefor.

Carl Meyers of Frankfort, New York, has charge of the explosive parts of the enterprise, and Gen. Drydenforth is general superintendent of the experiments. A large shipment of apparatus has been shipped to an arid region in Northern Texas, where the trial will soon be made. It is said that there are three score balloons, each ten feet in diameter when expanded; likewise about 100 kites five feet high,

a freight car full of wooden mortars to fire bombs from, and many thousands of pounds of dynamite, gunpowder, nitro-glycerine and other powerful agents.

It must not be supposed, however, that this bombardment of the heavens will be conducted without scientific method. Before it is begun the observers of the expedition will ascend in a suitable aeronautic balloon and find out by the way the hydrometer works at what level the explosives may be most advantageously set off. If they discover the greatest amount of moisture at an elevation of 1500 feet, that is the stratum of air in which they want to do their work. The theory of the matter no one pretends to understand very thoroughly, but it is imagined that the artificial combustion of a sort of vortex or hole in the air, into which the heavier moist particles rush, so as to occasion condensation and precipitation of rain. It is surmised, also, that the small particles of water made by the explosion of the combining oxygen and hydrogen form a sort of nucleus for other particles to gather about. Another important idea is that the watery particles in the atmosphere, being heavier than the rest of the air, are shaken out of it by the concussion and fall upon the earth.

The notion is that, supposing the efficacy of explosives for producing rains once proved, communities or farmers might make it their business to establish detonating plants, employing for the purpose balloons, kites, mortar bombs, or what not. The balloons to be used in the approaching Government trials cost about \$22 apiece, but the expense entailed for a score or so of these would be of no consequence to a district for which a single good shower might signify \$10,000, or even \$100,000 of value.

A convenient and excessively arid plain will be selected for operations and the wooden mortars will be planted across it in drills, as it were, for a distance of about two miles. They will be loaded with dynamite, rock-rocket, and other materials calculated to agitate the atmosphere as much as possible, while at suitable intervals of space the balloons will be arranged for ascension. Simultaneously a flight of kites will be let loose in the air.

The three-score balloons will in themselves represent an extraordinary scientific novelty.

They are all completed now, and each one is calculated to hold about 525 cubic feet of gas—one-third oxygen and two-thirds hydrogen. The oxygen is put in first and then the hydrogen. Each balloon, upon being inflated, ascends under control of a double wire, which serves instead of a rope to hold it by. When it reaches the desired height, the button of an electric instrument on the ground is touched, a spark ignites a fuse in the balloon, and the oxygen and hydrogen suddenly combine with a terrific explosion. Experiments made in Washington show that such an oxy-hydrogen balloon, thus ignited, produces a really tremendous detonation, the cloth or paper vessel itself appearing for an instant and by daylight like a ball of fire. Few things can be imagined more curious than this phenomenon, which signifies that the two gases, at the touch of fire, have united in the shape of a drop or two of water, which harmless fluid consists of two parts of hydrogen and one of oxygen.

But, as has been said, the balloons will be supplemented by great kites, each of which will be held by a double wire instead of a string. Their tails will carry dynamite and other explosives, which will be set off in the same way by the electric spark. Meantime, while the oxy-hydrogen bags explode and the kite tails go hang, the hurried mortars will vomit forth dynamite to the heavens all along the two-mile line. For at least two and possibly three days the racket will be kept up. Then the expedition will hoist its umbrellas and calmly await the downpour, consoled for the inconvenience by the exclamations of an agricultural population, which has learned to appreciate the fact that moisture is wealth.

CALIFORNIA ELECTRIC LIGHT CO.—At the annual meeting of the stockholders of the California Electric Light Company held Monday, the acts of the directors during the past year, including the proposition to form a new company in conjunction with the Edison system, were unanimously approved. The old directors and officers were re-elected. The directors are: P. B. Cornwall, Gustav Sutro, Alvin Hayward, Wm. Kerr, George H. Roe, Ramon E. Wilson and John R. Spring. The officers are: P. B. Cornwall, Pres.; Gustav Sutro, Vice-Pres.; George H. Roe, Sec'y, and the Bank of California, Treas.

Postal Telegraphy.

An Omaha journalist, Mr. Edward Rosewater, who has for several years given much attention to the promotion of the movement for postal telegraphy, is now doing public service by visiting Europe for the purpose of gathering information as to what foreign Governments have really accomplished in this direction. Mr. Rosewater was summoned last winter before a committee of Congress, which had been formed to obtain information respecting the advisability of the Government buying up or controlling the postal telegraphic service of the United States. He went abroad with official letters to the heads of the telegraph services of England, France, Germany and Austria.

A reporter who visited Mr. Rosewater in Paris asked what opinions he had formed from his investigation. In reply he said that he was more than ever confirmed in the opinion that the effect of government control was to produce a superior telegraphic service. He said that London employed no less than 3000 persons in the telegraphic service, whereas in New York there were only 1200. The object of the English Government was not to make a revenue, but to give the public the best service at the cheapest possible rates. In every place where there were 1500 persons there was a postal telegraphic service, whereas in the United States towns with several thousand inhabitants had nothing but the railroad telegraph service.

This is just the state of affairs which we supposed such an investigation would bring out. Where the Government owns the telegraph, the public is cheaply and efficiently served, and telegraphing becomes a common means of inter-communication. Where the business is controlled by monopolies, as in this country, the charge is exorbitant, the services inefficient, and people do just as little with the wire as they possibly can. It is certainly a reflection upon our intelligence and progressive spirit as a people that we are willing to be hampered and repressed in this manner. We have much to learn from some countries which are looked upon as old foggy and slow-going in some respects. We hope Mr. Rosewater's report will wake the people up on this question.

The Storage Battery Patent.

A dispatch from New York, dated July 23d says: "Mr. Brush was the first in this country to make the broad invention. He is entitled to the fruits of his invention. It is policy to reward him." In a decision embodying these words Judge Cox of the United States Circuit Court for the Southern district of New York, substantially brought to an end, for the present at least, the five years' litigation for the control in this country for the manufacture and sale of storage batteries. The decision is of great interest to electricians and to officials of railroads, many of whom, intending to use electricity as a motive power, were compelled to halt, pending the result of the litigation. Among these roads is the Fourth Avenue Surface Line in this city, which will now proceed to put storage battery cars on its line permanently.

The patents, of which Charles F. Brush is owner, and the Consolidated Electric Storage Co. is licensee, have 12 years more to run, thus giving that company a monopoly of the storage battery business in this country for that time. Judge Cox's decision was given in the case of the Brush Electric Light Co. against the Electrical Accumulator Co.

A fight has been waged for years between the Julien Electric Co., the Brush Electric Co., and the Electric Accumulator Co. Following this the Consolidated Electric Storage Co., successors to the Julien Electric Co., purchased the exclusive license throughout the United States for the Brush storage battery patents, and the cause of the Brush corporation against the Electrical Accumulator Co., was pushed and came to a hearing about a month ago. The decision awards to Mr. Brush the sole and exclusive right for the manufacture and sale of every type of modern storage batteries.

HENRY HARLAND, the amalgamator at the Uncle Sam mine, on Squaw creek, Shasta Co., has left for South Africa, where he will enter the employ of the De Beers mining company, the same company in whose employ is Mr. Butters, formerly of Shasta Co.

GIGANTIC RED CEDAR — *Thuja gigantea*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

LOUVRE CON. GOLD MINING. Co.—*Ledger*, July 25: This company, with office in San Francisco, owns five claims in Plymouth district, about four miles north of the town of Plymouth, near the Bay State claim. They have about 13 men employed, and have run a tunnel 155 feet into the hill, exposing an ore body, said to be between four and five feet wide, 140 feet from the surface. The company are working on two claims, and feel very much encouraged at the outlook. The ore is reported to be of good paying quality.

GOVERN.—Work is progressing favorably at the Govern. On the 18th, they succeeded in clearing the 1000-foot level of water. We are glad to report that they find a most promising outlook on this level, there being in sight a large vein of ore in the face of west drift of good milling quality. During the last 60 days, the electric pumps have landed on top over 1,000,000 gallons of water daily. During this time the steam pump in the bottom has caused the electric motors to be continually dripping with moisture, showing that by proper insulation there need be no fear of wet or damp mines. As soon as the sump is cleared, preparations will be made to commence sinking the shaft for another level. Last month's run proved to be very satisfactory to the stockholders, and a bright future seems to be dawning upon the mine.

REEVES.—A vein of ore was found in sinking shaft, which promises good returns, as it prospects well in free gold.

QUARTZ MOUNTAIN.—Preparations are being made to start up the mill for a test crushing. Mill is now being put in order, and several important changes are being made with a view to a closer saving of the gold and sulphurets. Two Woodbury concentrators will be used for concentration, and the tailings run over a canvas plant like the Govern. Settling tanks and sluice tanks will be added, and it is hoped by these precautions the rock can be made to pay.

MISCELLANEOUS.—A few tons of quartz from the Mello claim, at Jackson Gate, were crushed recently at the one-stamp mill of the Amador gold mine. The yield, we are informed, was \$10 per ton. This fell far below expectations. It would pay well at that rate if they had a mill near the mine, but to hire a mill and pay for hauling three miles is a losing proposition. The Kennedy mine paid a dividend of 49 cents per share last month. It is reported that the last cleanup amounted to something like \$90,000. They have commenced sinking a shaft at the Clinton Consolidated. A kiln of 100,000 brick has been burned for the purpose of building chlorination works.

El Dorado.

NEW HILL.—*Mt. Democrat*, July 25th: Preparations are being made for the erection of a five-stamp mill at the Baltic mine, in Baltic district. They have about 100 tons of ore on the dump, and the mine so far developed as to keep the mill supplied for a long time. The ore pays, by arrastra process, \$40 per ton. At the Blue Gorge mine, in the same district, development is being vigorously prosecuted. The vein is found to be 100 feet wide between walls, filled with gold-bearing material, every foot of which prospects well in free gold. The Scironi mine, in the same district, is being opened up, the ore showing free gold. S. A. Lane is making good progress with his tunnel at Russian Diggings, to develop a gravel channel. Good ore is now being taken out at the Parker mine in Brownsville district. Their mill is kept running. It is reported that the old Spanish mine, near Fairplay, will be started up again in September. A good bench of gravel has been struck in the Rogers mine at Smith's Flat. At the Toll House mine, near Smith's Flat, a few men are at work drifting north. The tunnel at the old Granite gravel mine has been retimbered. At the Landecker mine, at Weaver Hill, a force of men is drifting out gravel, and the mill is kept running day and night. N. J. Coleman is sinking a shaft with a full crew of men at the Agnes mine, in Diamond Spring district. Dan Wickham and George Ranney have just completed a hoisting plant at the Bryant mine, in the same district, and sinking will commence Monday. At the Church mine, in Mud Springs district, richer ore has been struck at the 600-foot level than has ever been found in that mine above that level. Good ore is being taken from a 100-foot shaft at the Los Padre mine, near Nashville. Attention is being attracted to the Jay Hawk district. Some fine samples of ore have been exhibited from mines there. The Pacific Co. of Placerville are making developments all along the line. The Pacific mill is running ore from that mine. A mill is reported in contemplation at the Epley, where they have opened up a fine body of ore. It is also reported that they will soon begin crushing ore from the Harmon mine. They are running tunnels to crosscut ledges at other points along the line of their extensive system of mines. The Gentle Annie mill, at Poverty Point, is running regularly and increasing on its regular output of bullion, the ore improving in character as they get deeper on the vein.

GEORGETOWN DISTRICT.—The mill at the Taylor mine is kept running regularly, and it is reported that rich ore is being brought to the surface. The Van mine is tied up on account of litigation among its owners.

KELSEY DISTRICT.—The mill at the Dalmatia mine is working regularly 4000 tons of ore per month. The entire cost of milling and mining the ore is only 45 cents per ton. They have a mountain of material, and though of low grade it is paying a large margin. Captain Newton will have his new hoisting plant at the Darling mine ready to run the coming week. At the Martin & Amhar mine good progress is being made with their new plant. J. A. Jurgenson is opening up a mine on Dutch Creek, which is reported to contain \$60 to the ton in gold and silver. The vein is 30 feet wide.

GRAVEL.—*Georgetown Gazette*, July 23: The Dow gravel claim at Cement Hill, four miles north of town, is being prospected under the management of Messrs. Wm. Gassman and J. S. Houser of Woodland, and A. Dow of this place. Some time ago, Mr. Dow had over 700 feet of tunnel driven

in on the mine, which proved to be too high. This spring the new company began work on a new tunnel, now in over 100 feet, which gives 70 feet more depth. J. C. Rich is now sinking an air shaft which will soon be completed and work on tunnel resumed.

DRIFT.—The Calmes gravel mine on Otter creek has been taken hold of by John McKenney, the Lake Tahoe landlord, who is engaged in running a tunnel to drain the mine at a depth of about 100 feet below the shaft which had to be abandoned because of too much water.

Calaveras.

QUAKER CITY MINE.—*Calaveras Chronicle*, July 25: We visited the Quaker City mine, located near the junction, about four miles south of this place, last Tuesday. We were affably received by the genial superintendent, T. A. Goodwin. The shaft has now attained a depth of 500 feet, the contract for sinking the last 100 feet being about completed. When this last sinking was commenced at the depth of 400 feet, an ore body between three and four feet in width was followed down at an angle of about 64° to a depth of about 58 feet when the rock changed to vein matter composed of blue black gouge and kidney-shaped quartz rocks ranging all the way from the size of a man's fist to boulders four feet in diameter. Sinking through 37 feet of this vein matter, a solid body of fine-looking ore was again encountered, measuring about three feet in width. This is very encouraging.

SIGNS OF AWAKENING.—*Campo Seco* is on the eve of an awakening. The cause of this prospect of renewed business activity is the commencement of operations to re-open the rich copper mines in that locality. There is already fine and extensive plant by which the ore has been worked, and thousands of tons of ore are in dumps ready to be reduced. A new company has now the property in hand, of which Mr. C. Borger, of Campo Seco, is the superintendent, and operations are to be conducted on a more extensive scale than ever before. Smelting works are to be erected, grading for the plant being now about completed. When all is completed and the works and mine are in full blast, there will be employed in and about the mine and works between 200 and 300 men. The revival of the copper mining industry in the locality means an infusion of new life in the town.

Inyo.

INCREASING.—*Inyo Index*, July 24: Mining developments in Inyo are being made at a steady rate and ore production is constantly increasing. With silver above \$1, and lead advancing, a much greater output of ore is among the certainties.

Mono.

THE LAKEVIEW MINE.—*Bridgeport Chronicle-Union*, July 23: The Lakeview mine at Lundy continues to be the center of attraction to the people of this country, and pilgrimages are being made to it from all parts of the country. Postmaster A. F. Eryant, of Bridgeport, took a drive to Lundy on Wednesday, and returned on Thursday, full of enthusiasm over the mine, which is rich, beyond anything he has known in the mining line. A few tons of ore worked at one of the mills produced a \$500 gold brick. The mine, as far as developed, is a mass of gold, it being estimated that there are \$10,000,000 now in sight. The machinery for the mill is probably now on the site selected for its erection, and no time will be lost in erecting and getting it in operation. A large number of men are working on the road, which is nearly completed. A rich 13-foot strike has been made in the disputed ground of the Bulwer and Standard Con. at Bodie. It was struck by the Bulwer miners, who stopped work when a protest was entered by the Standard Con. Unless these corporations compromise, it will lead to another big suit, as the territory is too rich for either to give it up without another legal struggle, and in the meantime it does not help Bodie or the county.

Plumas.

NOTES.—*Plumas National*, July 25: Last Tuesday, we took a trip to the Homestake mine, owned by Thomas & Thompson, and found the boys hard at work. This company has run a bedrock cut 20 feet deep a distance of 200 or 300 feet, and will now have to run a tunnel 250 feet before they will strike the ground they intend to work. An immense amount of work has been done during the summer by this company, but when once into the mine, their reward will be rich. We next visited the old Jackson ledge, where we found Messrs. Braden, Larson, Orr, Richards, and John McCarty hard at it. A five-stamp mill is being put up under the supervision of Mr. McCarty, which will be completed in a week or so, when, if one can judge from the prospects that the rock shows, we will hear of some rich returns. From Joseph Peppin, who was up from Granite Basin this week, we learn that the mining outlook is very flattering in that district. The Gold Saver ledge, owned by Mr. Peppin, is on a good paying basis. A 20-stamp mill is on the mine, and a tunnel is in between 300 and 400 feet on a well-defined ledge from 12 to 14 inches thick. The rock crushed averages \$20 per ton. The Hidden Treasure, also owned by Mr. Peppin is another good ledge, on which a prospect tunnel has been run, showing up \$10 rock. The Oliver Quirk and Morning Star ledges are also owned by Mr. Peppin. On the former a tunnel is in 800 or 900 feet, the ledge being a foot or more in width, and the rock goes \$12 a ton. The Morning Star ledge is 2½ feet in width, and is a true fissure ledge lying between granite and slate or iron rock. The sulphurets from this ledge, which are of a bluish color, assay \$700 per ton. W. C. Graves has a five-stamp mill on the Flowerpot vein, with a tunnel in about 100 feet. The rock prospects rich. On the Amos Swan location, on which is a five-stamp mill, a cleanup of \$400 was made for one month's run. The rock crushed paid \$20 a ton. A Christie, who owns the Mexican ledge, has a tunnel in about 500 feet. The ledge is 20 inches wide, and the rock goes \$15 a ton. Mr. Bowers also owns a ledge and has a tunnel in 60 feet with \$10 rock. See & Jolly, who own the Specimen ledge, are in 300 feet, the rock being good for \$16 a ton. Granite Basin is bound to be one of the best quartz mining camps in the county, before a great while.

Sierra.

PROSPECTING.—*Mt. Messenger*, July 25: J. E. Hubbard, who is prospecting on the Middle Fork, not far from the Four Hills quartz mine is running a cut into a flat at the junction of Four Hills creek and the ravine that comes down from the Franklin

Consolidated gravel claim. He is not on bedrock yet, but the gravel prospect.

QUARTZ.—Streaks of quartz were struck recently in the Maple Grove tunnel, but a prospect yielded no gold. The rock is a little harder than it has been.

POKER FLAT.—T. C. Corlett was over from Poker Flat, Thursday, and said that he did better than he expected to in his gravel claim, pay averaging over \$6 a carload.

TUNNEL.—Wm. Rouse has nearly finished the lower tunnel to the quartz ledge of Jesse Carney at the head of Jim Crow canyon, there being only 15 feet to run to tap the ledge.

Siskiyou.

SCOTT BAR.—*Cor. Siskiyou Telegram*, July 24: Mining in this section offers to the people a field of study replete with pleasure and utility. Wonderful progress has been made in prospecting throughout this section in the last few years, and still the way to other grand discoveries lies open to the diligent miner so we desire to call the attention of who are in search of mines to the fact that in the near future Siskiyou will be the hanner county of the State. The several Hill and River mines in this vicinity are now under headway. Among those I might mention are Bennett & Co., and Reynolds & Jacobs. Bennett & Co. are busily engaged reopening their drift. They expect to be taking out pay grit in about a week. Reynolds & Jacobs' mine, continues to pan out well, considering that their water supply is very short. They are at present engaged in changing the position of their pipe and giant. The Never Sweat mine on French Bar will be of the wingdam species and it no doubt will yield well to its owners when opened. Brunt & Co.'s mine on French Bar yields fair returns to the owners. The McCauley on French Bar, owned and managed by McCauley & Son, promises this season to pay exceedingly well as this claim is adjoining to one that yields well. D. W. McCarty is opening up a new mine on Red Hill south of Scott Bar; the prospect is favorable.

Trinity.

EAST FORK.—*Cor. Journal*, July 25: There are at present about 100 inhabitants on the creek including Chinese, and every mine except the Golden Chest is being worked. At East Branch, Krumpke & Co. are building arrastras for working their rock, and will soon have them finished. On Yellow Jacket, the Alaska Co. has shown up a large amount of high-grade ore. This company has been doing development work on its mines for two years, and now is satisfied that they have a good proposition. The ledge on the lower will average three feet in width. Suitable machinery for milling the rock will soon be put in position. The Yellowstone, which had been temporarily closed down, started up its mill on the 14th with rock enough in sight to run for months. Continuing on down, we come to the Enterprise and Lone Jack. The mill is running on full time on Lone Jack rock, a large amount of which is in sight; and as the formation is soft, the ore can easily be extracted. The mine is favorably located on the west side of East Fork, and can be worked at a very small expense, the mill being run by water-power. The North Star Co. has tapped the lode with something over a 300-foot tunnel. The ledge at the crop-out is about three feet in width, and looks well. A tramway with cable attachment is being built to lower the ore down the mountain to the main tram, from whence it will be transported to the mill by horse-power. The Thanksgiving mine on Barney gulch is nearly fitted up to commence crushing. New tunnels have been run to tap the lode at a greater depth, and the vein is three feet in width where cut and looks very promising and prospects well. A tramway has been built from the mine to the mill and will do away with the old method of hauling the ore in carts, which is an expensive way of conveying ore any distance. The mill that used to crush the ore is a large-sized Huntington, run by steam and fitted up with all the modern appliances for saving gold. The Old Engle mine on Rich gulch is turning out well. The owners have run a new tunnel on the lower level under the old works, and have found a large body of rich ore. This mine was the first quartz location made on East Fork over 20 years ago. The mines of East Fork are in a more prosperous condition than they have ever been seen since the first location was made, not that they are any richer, but for the simple reason that they are being worked in a systematic manner. Capital has taken hold of them, and a large amount of money has been expended in prospecting and developing the discoveries, which has been of great benefit to the county in general.

Tuolumne.

POCKET MINING.—*Independent*, July 25: Another pocket was struck this week in the Swerwer mine, at Tuttletown, making about \$8000 recently extracted. The Oakes, Yancey and Shaw mine, on the old St. Cyr ranch, has been producing some of the golden article during the past several weeks, though as yet nothing very big. The Eichelroth mine, on Brown's Flat, worked by Smith & Eichelroth, is displaying a good prospect. Several hundred dollars have been taken out during the month. A cave occurred this week in Kelley's Last Chance mine.

NEVADA.

Washoe District.

CON. CAL. AND VA. MINE.—*Virginia Chronicle*, July 25: There has been extracted from all parts of the mine during the week 2295 1070-2000 tons of ore, of which 864 1920-2000 tons was shipped to the Morgan mill and 1430 1150-2000 tons to the Eureka mill. The average assay value of all of the ore worked at these two mills during the week (2440 tons) was \$22.66 per ton. Bullion shipped to Carson Mint, assay value, \$37,857.42. Bullion now on hand in our assay office, assay value about \$20,500.

OPHIR.—1465 level: We have continued our prospecting work from the openings in the vicinity of the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level. No ore has been extracted during the week.

MEXICAN.—On the 1465 level, the south drift started from the east crosscut No. 1, at a point 618 feet in from the main north lateral drift has been advanced 27 feet; total length, 57 feet; in vein matter showing clay separations.

UNION CON.—The northeast drift started from

the east crosscut No. 2 on the 1465 level, at a point 853 feet in from the main north lateral drift has been extended 27 feet; total length, 53 feet; in a mixed formation of clay, porphyry and quartz.

CHOLLAR.—The new station at the 1500 level in the incline is completed. Extracted and sent to the mill the past week 520 tons of ore, worth \$10.20 a ton, as per battery samples.

POTOSI.—The winze is down 53 feet below the 1500 level. The bottom is in porphyry and streaks of quartz.

EXCHEQUER.—East crosscut on north line, 600 level, is out 271 feet; face in porphyry.

ALPHA.—North drift from west crosscut, 100 feet north of shaft, 500 level, is out 42 feet; face in quartz yielding low assays.

UTAH.—725 level: The south drift from the winze station has been extended 20 feet; total, 156 feet, continuing in a hard porphyry formation. At a point in the south drift 52 feet from the winze station have started a southeast drift in a quartz formation.

SIERRA NEVADA.—On the 630 level west crosscut No. 1, from the northwest drift, 571 feet from the shaft, is advanced 724 feet, 37 feet having been made during the week, continuing through the same formation.

OCCIDENTAL.—Extracted 40 tons of fair-grade ore from the stopes on the 350, 400 and 450 levels. Have started to stope ore from the 550 level at the head of No. 2 winze. The top of the stope is in \$40 ore. Milled during the week 285 tons of ore of the average assay value of \$16.25 per ton.

GOULD & CURRY.—East crosscut 65 feet above the 200 level has been advanced 16 feet through low-grade ore; total length, 71 feet. West crosscut opposite east crosscut has been extended 10 feet; total length, 92 feet; face in soft porphyry.

BEST & BELCHER.—1100 level: East crosscut from northwest drift has been advanced 15 feet; total, 90 feet; face in soft porphyry and stringers of quartz. West crosscut No. 1 from top of upraise from 200 level was advanced 20 feet; face in hard porphyry and stringers of quartz.

Jackrabbit District.

DAY AND MENDHA.—*Pioche Record*, July 25: Supt. S. T. Godbe reports matters at both the day and the Mendha mines as looking exceptionally well. At the Day, the new tunnel being run in the Junction ground is in some 90 feet. The ore body continues to improve in size and quality and a winze and an upraise are being run in it, both in ore, though in the upraise the ore is much better in quality than it is below. About 28 tons of ore from this place have been shipped to Milford as hack freight, the average value per ton of which was 90 ounces in silver with a good percentage of lead. A large quantity of similar grade ore now lies on the dump. From the indications present Supt. Godbe believes the development in the Junction will equal those in any other quarter of the mine. At the Mendha the new working incline has reached a depth of 535 feet, and the mine looks better than it ever did before. The ore now lying on the dump, taken out in the course of development, will, it is estimated, give a net yield of \$13,000. The new incline shaft which goes down at the same angle the whole distance, was for some time past out of the ore channel. Last week ore was struck again, and on Tuesday a splendid showing was made, when the drillings, 18 inches deep, from a 7 by 9 foot face of ore were assayed and showed a value of 105 ounces in silver per ton.

Pine Nut District.

GOLD DISCOVERIES.—*Silver State*, July 28: The excitement over the Pine Nut gold discoveries near Carson is growing. Between 12 and 15 prospectors arrive daily. All go armed to protect their claims, and bloodshed may follow over some of the ledges. The entire country, covering a space of ten square miles, is full of quartz ledges, many showing free gold on the surface. Hebe Holman, foreman of the Best & Belcher and Gould & Curry at Virginia, says of the diggings: "I have made a thorough investigation and regard the excitement as based on a good foundation. The discoveries are as good as those made on the Comstock, and if the surface indications amount to anything, the result will be a heavy influx of mining men within the coming week. Several regular surveyors are now on the ground surveying over 50 claims. There seems at some time to have been a general upheaval which pushed the ledges through the surface. Wm. Zirn, the discoverer, panned out \$60 in one pan before me yesterday, and says he has taken out \$400 in a small sack." A town-site has already been laid out and named Zirville. A stage-line will be put on from Carson by Oliver Roberts. The distance is 25 miles. Teams will take out building material as soon as possible.

COLORADO.

SILVERTON MINES.—*Miner*, July 15: Henry Miller has started up work on the Blucher in Eureka gulch, and is getting out a fine grade of ore. Frank Brown has leased the United States Treasury, and two men took out a car of ore the first 11 days. Supt. Ward of the Lead King mine reports a good showing of ore, and contemplated building a mill at an early date. In the stope of the Senior Warden a streak of ore has been uncovered which assays 560 ozs. silver. The ore previous to this was low-grade.

Sam Funk is working a force of men on the Indiana, formerly the Poison Spring, and is sacking ore for shipment. John Fossback made a strike in his Bonita mountain property a few days since. The ore is principally gold bearing and yields \$210 per ton. Supt. Grabowsky this week started work on the Black Prince, a fine property owned by W. B. Severn, of Chicago and Thos. Merrill, of Saginaw, Mich. The Pearl started up this week with 12 men. The force was employed excavating for the hoisting plant which is to be put on the mine. Wm. Moyle is foreman. The King mine is looming up grandly. The last carload of ore yielded \$75 per ton. Eight men are employed on the property and the Herr brothers are happy. Ed. Brown, Dr. Copp, Dr. Rader and Cashier Valles, of Durango, have secured a valuable property near Ophir. Ore extracted and sold to date, while drifting, leaves a margin after paying all expenses. Steve Higgs is now foreman of the Caribou at Ophir. The mine is said to be looking first class. Steve is a rustler and will endeavor to make the mine pay well. A fine body of sand carbonates has been found in the Mary Beal claim above Gladstone. The stuff seems to be de-

composed iron, among which is found boulders of lead. Probably the capping of some ore chutes. The Tyrolean leasers on the Ohio are doing well from the start. They are in good ore both on the surface and in the tunnel. Some seven tons of ore are sacked this week, and the output is now steady at one ton per day. A seven-ton lot of gold quartz from the Mastiff, owned by J. W. Heck, was put through the Ward stamp mill this week. Ten and one-half ounces of gold were saved on the plates and several hundred pounds of concentrates was the result. Mr. Heck has a large body of this ore. The formal transfer of the Sampson was completed fast week, and the first payment has been made. Mr. James W. Mason, of the San Bernardino company, will be the manager. The mill is to be enlarged at once, and a large force of men employed on the mine.

THE MCARTHUR-FORREST PROCESS.—Bedrock Democrat, July 6: At last it seems that all things are in readiness at Cracker creek for the long talked-of test of the ores of the Eureka and Excelsior mines, owned by the Eastern Oregon Consolidated Gold and Silver Mining Co., by the McArthur-Forrest, or Cyanide, process controlled by the Gold and Silver Extraction, Mining and Milling Co., of Denver Colorado, a process that is said to have been successfully worked in South Africa and Australia on base ores. The Denver Co., have made an outlay of about \$8000 in preparing machinery, etc., for this test, which outlay will be returned to them if the test proves successful. Last Saturday, Mr. Gordon Wilson, of Denver, the expert in whose hands the success or failure of the test lies, arrived here and immediately proceeded on to Cracker creek by stage Sunday to commence operations. The test will be made first on a run of 25 tons, and if successful a run of 100 tons will be made. During the present week Mr. John B. Farish, the prominent mining man, also of Denver, will arrive here in the interest of the E. O. C. G. S. & Co., and on his report, future operation of the Eureka and Excelsior mines will be governed. The success of this test is devoutly to be wished for. If successful, a new era of advancement and prosperity will take on, not alone in the Cracker creek district, but in adjacent camps. If failure should result, the mining industry will receive a setback that will take years to recover.

ARIZONA.

CABLE LINE TO A JUNCTION.—Prescott Courier, July 22: A special train went over the road Monday night. General Superintendent W. B. Jones, Col. L. F. Eggers and the writer were the only easy riders until Jerome Junction was reached, at which place E. L. Preston came on board, anxious to meet Hon. W. A. Clark of Butte, Montana, owner of our great United Verde mines and smelters, likewise several other mines and smelters. His people, here are mining and smelting on a large scale. They are also constructing a cable line from Sander's Station to Jerome. Clarke's head men said that Supt. Giroux had two furnaces running and others almost ready to run. Mines are well developed and producing fine ore. The plant is one of the largest and best in the Southwest. Carloads and piles of machinery for the cable road, also a great Corliss engine, were lying at the junction. Work on the cable road is progressing, and it will not be long until the work of building railroad to meet it will be commenced.

GOLD.—I. T. Stoddard's people have found considerable rich gold ore in the Copper Mountain mine. A mill will soon be running. Mr. Stoddard left for Chicago to-day to meet Jesse R. Grant, Commercial M. Co. has about 120 men in its employ in Big Bug district. They are running the smelter, taking ore out of the Boggs and pumping water out of the Hackberry. Same company has about as many more men as the Senator and Copper Basin. W. A. Clark of United Verde has about 160 men employed. Heavy shipments of sulphurets keep coming from the Congress.

IDAHO.

MOOSE CREEK PLACERS.—Helena Journal, July 22: Ed Mitchell has returned from the Moose Creek placers, just over the Montana line in Shoshone county, Idaho. In early days these mines were extensively worked, expensive ditches being constructed to operate the rich channels and bars; these worked out, the diggings have for years lain dormant. This season some 50 miners were engaged in prospecting and sluicing with favorable results. The rains have not been as copious as in Montana, and work for the season is about over; most of the miners engaged in the district will return next season, as it is demonstrated good pay can be made. Some promising quartz leads have been discovered, but not yet sufficiently developed to determine their value.

SMOKY.—Wood River Times, July 17: There is somewhat of a reawakening in the Smoky mines. The Hidden Treasure above Revis' placer claims, and which is owned by Charles Sherry, of this city, shows considerable ore of a somewhat low grade as a rule, but some of it will pay a good profit. Newt. Revis' placer claims are being worked as usual, and as the supply of water is much greater than usual this year, the yield should be equal to that of the best years. Below Mr. Revis' claims a Minneapolis placer mining Co. in which Captain Austin is the principal shareholder, began operations a few weeks ago, under the superintendency of David Whitmer, former owner of the claims. About a dozen men are at work, preparing to lay a bedrock flume down Little Smoky creek. The flume is made on the ground by Hailey carpenters, and the work on the water ditch that will supply the flume is commenced. This ditch will give a head of 27 feet at the head of the flume, and water is expected to be turned on within 10 days. The ground being quite rich, no doubt is entertained of the success of the company. In Galore gulch McCarter & Reedy are beginning to extract ore from the Tyrannis, and the leasers on the Galore-Stormy have some ore out, which they think will assay 500 or 600 ounces of silver to the ton. The vein is not very wide, but the boys say that a few inches of such ore do very well for men of moderate expectations. There is a great quantity of ore in sight in the 3000-odd feet of openings in this mine. Ten men are employed in Galore gulch. At the King of the West the last shipment of accumulated ore from last winter's work was made this week. This mine, it will be remembered, was shut down this spring. Now that silver is again appreciating in value, the workings of the mine are being pumped out and preparations made for an

immediate resumption of operations. At the Pot Wrestler, Trade Dollar, and several other properties, the leasers or owners are either extracting ore or getting ready to do so. Altogether, about 100 men are at work in Smoky.

BOISE BASIN.—The Monarity Bros. have ordered of Fraser & Chalmers a 10-stamp gold mill for their mine at Elk creek. Geo. Stuck has gone up to commence preparations for erecting the sawmill as soon as it arrives. This will be the fourth mill erected on that vein. The first was the Suh Rosa, which was erected at the Suh Rosa mine, discovered by W. W. Horton. Mr. Horton run the mill, which was a 10-stamp, for several years. It was accidentally burned six or seven years ago. The Forest King, a location farther west on the same vein, has had a five-stamp mill for several years, and a 10-stamp was erected on the Washington, which joins the Suh Rosa on the east. The latter has been running two years, during which time it has turned out considerable bullion. As the mill is a wet crusher the large quantities of silver ore coming out has to be laid aside until such time as the company concludes to erect roasters. The argentiferous is the richest ore they have and when the roasters are erected, which will most likely be this fall, some big cleanups may be looked for. At present the mill runs only during the day, yet the monthly cleanups range between \$8000 and \$12,000. The mine has now nearly paid for all development and the mill and steam hoisting works. The vein on which these mines are situated is traced and located a distance of three or four miles. Gold and silver has been found on it the whole of the distance, and when properly developed there is no doubt but that six or eight large mills will be needed to reduce the ore. The course of the ledge is nearly east and west, and it is situated 10 miles north of Idaho City. Wm. Sweet has been obliged to discontinue work in the Muddy shaft at the head of Grime's creek. This shaft followed the vein down a distance of about 240 feet, and is large and rich in free gold all the way. Whether the company will erect hoisting works or run a tunnel from the Payette side is not yet decided upon. It is not known whether the London company having bonds on the Washington group of mines in Gambirino district, and the Moscow and other mines in El Dorado will purchase them. It is hoped that the sales will be made as the company is a go-ahead, energetic one and has already spent over \$1,000,000 in this county which was a total loss.

MONTANA.

PLACER MINING.—Mining Journal, July 15: In the present season of copious water supply little thought is given to improved methods of working gravels for the purpose of extracting their gold contents. The average placer miner is content, as with the employment of the old means the output will far exceed that of many former years, yet it is a fact that the inventive genius, so dominant in this age, has been and is continuing to devote much midnight oil and great capital in the endeavor to realize greater results from a given amount of the forces of nature. In the dredging and amalgamating plant now working on the bars of the Jefferson river above Three Forks, not far from \$100,000 has been expended to demonstrate the practicability of the process. The promoters are now on the ground and it will soon be known to what extent success has been attained. It is well known to all placer miners that the hydraulic process, even with the use of undercurrents where applicable, fails to recover fine gold which exists in varying quantities in all channels and bars, and the first end, endeavored to be attained by the application of machinery is the saving of this fine gold, in many instances of greater value than that recovered in the boxes, and secondly, the economical use of water. Experiments on a practical scale are being made in California, Montana and Colorado to accomplish these two purposes the final result of which will absolutely revolutionize placer mining, and many grounds now abandoned will be worked with great profit. The fundamental principle upon which all of these new methods are based is the lifting of the gravels by mechanical means, depositing the same in machinery designed to eliminate the coarse gravels, saving the fine residuum and subjecting it to an amalgamating process through the use of water and quicksilver. Given a yard of gravel, by mechanical means dispose of the heavy gravels composing three-fourths of the bulk, and it can be readily seen that only one-fourth of the water required to treat the entire mass will be required, and that 100 inches of water will perform the service 300 would under the ordinary method; add to this the saving of fine gold that can be recovered, and the result is the profitable working of gravel heretofore considered valueless. In all of these projects grade and dump are immaterial factors; ground can be worked down grade as well as up grade. In this department of mining there are a dozen Richmonds in the field, and a sure winner is among them. Hold fast to your placer grounds.

NEW MEXICO.

CONTENTION.—Southwest Sentinel, July 17: The Contention mine in the Tres Hermanas district has just been leased to Mr. Martin, formerly foreman on the Graphic mine at Cook's. This mine belongs to John D. Ball, the heirs of Tom Hall and the McComas heirs. It is a blanket formation of silver-bearing lead carbonates, lying on top of lime. The ore carries from \$8 to \$16 silver, and from 30 to 50 per cent lead. The ore body runs up to four feet in thickness. It was formerly worked under lease and handsome royalties were paid. As the railroad from Deming southward will pass within three miles of this property, it will become much more profitable.

BULLION.—The freight and express shipments of bullion, ore and concentrates from Silver City during the month of June amounted to \$15,491 worth of gold, \$184 worth of silver, 115,320 pounds of high-grade sacked gold and silver ores, 442,500 pounds of concentrates, 960,000 pounds of lead ore and 1,800,000 pounds of iron ore. These figures are as nearly correct as possible, allowance having been made for undervaluation and underestimation of weights. They make a very fair showing. The amount of sacked ores is over 150 per cent greater than last month. The lead shipments have more than doubled those of May and quadrupled those of April. There is a decided increase in the amount of iron ore, and there is half as much again of concentrates. Owing to the building of the Silver City & Northern R. R., no zinc ores have come in for shipment from the Hanover district.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 21, 1891.

- 456,321.—VEHICLE TONGUE SUPPORT—Allen & Sandhofer, Auburn, Cal.
- 456,393.—CLAMP FOR CULTIVATOR TEETH—D. E. Barton, Alameda, Cal.
- 456,478.—SIGNALING APPARATUS—R. J. Crowley, Los Angeles, Cal.
- 456,356.—WINDOW CLEANER—J. O. Culver, Calistoga, Cal.
- 456,241.—TREATING COCONUT HUSKS—J. T. Davis, S. F.
- 456,256.—VALVE FOR GAS ENGINES—H. C. Fletcher, Pasadena, Cal.
- 456,492.—SASH BALANCE—Axel Johnson, S. F.
- 456,494.—SAFETY CAP FOR POWDER, KEYS—W. Mahoney, Santa Cruz, Cal.
- 456,425.—FEED CUTTER—J. McKenna, Martinez, Cal.
- 456,315.—REVOLVING CYLINDER ENGINE—C. G. Ruths, S. F.
- 456,166.—GUN LOCK—Z. W. Shields, Harrington, Wash.
- 456,260.—GATE—C. W. Thompson, Tomales, Cal.
- 456,320.—SUPPLYING WATER TO VESSELS—N. T. Whiting, S. F.
- 456,455.—SPRING MOTOR—H. H. Wilburn, Ritzville, Wash.
- 456,263.—PROP—J. K. Woodward, Riverside, Cal.

The following brief list, by telegraph, for July 28 will appear more complete upon receipt of mail advices: California—Washington Berry, Angel Island, sash balance; Maria Bingham, assignor of two thirds to A. Johnson and O. C. Hanson, Shelton, Washington, eaves trough hanger; Elijah B. Blaisdel and J. R. Morse, Los Angeles, hydro carbon burner; Matthew P. Campbell, Glasgow, assignor to himself and J. Rutherford, Spokane Falls, Wash., toothed gearing; Harry T. Clarke, assignor to Portland (Oregon) Iron Works, reversing valve; Pedro Costa, San Francisco, fishing-boat attachment; Adolf Fritsch, Sulem City, knife and scissors sharpener; William B. Harrington, assignor to himself, E. L. Jones and J. D. Deffries, San Francisco, railwa; Charles C. Lane, assignor to Hughes & Co., San Diego, Cal., roller for quartz-mills; Marshall Martin, Walla Walla, Wash., machine wrench; Nathan A. Wheeler, Alpowa, Wash., scissor.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraph). American and Foreign patents obtained and general patent business for Pacific Coast inventor transacted with perfect security, at reasonable rates, in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REVOLVING CYLINDER ENGINE.—Chas. G. Ruths, S. F. No. 456,315. Dated July 21, 1891. The three cylinders of the engine are fixed so as to radiate from a central shaft, and this shaft is journaled horizontally so as to rotate within its journal-hoxes. The outer ends of the cylinders may be open, and within are fitted the pistons having piston rods extending outwardly, and upon the outer ends of these rods are fixed anti-friction shoes or rollers. A ring is fixed upon a base, and surrounds the cylinders and shaft so that the latter is eccentric to the interior periphery of the ring. The position of the shaft with reference to the ring is such that when either cylinder stands with its end downward below the shaft, its piston will be forced into the inner end of the cylinder by reason of the contact of the anti-friction roller or shoe with the periphery of the ring at a point where said ring is nearest to the shaft upon which the cylinders are fixed. From this point the distance gradually increases until the cylinder is at the top or above the shaft, when its piston will have gradually moved out until it is at the outer end of its stroke, the shoe at the end of the piston rod remaining in contact with the interior periphery of the stationary eccentrically mounted ring. It will be manifest from this construction that whenever steam is admitted into either of the cylinders after it has passed its lowest point, where it is nearest to the periphery of the ring, the pressure upon the piston, forcing it and the piston rod against the interior of the eccentric ring, will cause the shaft upon which the cylinder is mounted to rotate, the piston gradually moving outward until it has reached the opposite point, where the piston is at the greatest distance from the center. Several of these cylinders being mounted upon the same shaft, each one takes steam successively as it passes the nearest point, and thus the operation is continuous. The action is similar to that of an inclined plane, the anti-friction roller upon the outer end of the piston rod traveling over the eccentric ring, which gradually increases in distance from the point where steam is first admitted until the cylinder has arrived at the point nearly opposite, and which is at the greatest distance from the central cylinder shaft, when the piston will have reached the outer end of the cylinder and the termination of its stroke in that direction. The following cylinder will meantime have arrived at the proper point to receive steam, and consequently two cylinders will be receiving steam at all times and acting to rotate the shaft. By this construction the inventor claims to provide a very simple and economically operating engine which is available for many kinds of work where but little space is available for an engine.

DEVICE FOR SUPPLYING WATER TO VESSELS.—Nathaniel T. Whiting, S. F. No. 456,320. Dated July 21, 1891. This device is specially applicable for the purpose of supplying salt water in large quantities to be used on steamers in connection with the condensers, and also for other purposes where necessary on such vessels. Large quantities of water are necessary for the purpose of condensing the steam used in steam-vessels, and this water is usually supplied by pumps, to actuate which, steam must be supplied from the boilers and more or less waste of power thus takes place. To obviate this, Mr. Whiting places an inclined pipe opening upward at or near the bows of the vessel, inclining

gradually upward from that point to the point of discharge and provided with check-valves. The pipe is made with an expanded mouth, which is fixed so as to be water-tight where it passes through the vessel, and at a point sufficiently below the surface of the water as to remain submerged except in case of great roughness of the sea. The check-valves open inwardly, but will close at any time upon a considerable reduction of the pressure so as to prevent water which is already within from flowing backward into the sea in case the movement of the vessel should momentarily raise the mouth of the pipe above the surface of the pipe. At the high rate of speed which is usually obtained by steamers, the water will be forced to rush into the mouth of the pipe and up the gradual incline until it reaches a point sufficiently above the condensers to deliver the water to them, from whence, after use, it may be discharged again in the usual manner. It will be manifest that the pressure within the pipe or pipes will be constant as long as the vessel is in motion, and that no power but that will be needed to raise all the water that is necessary for this purpose and for washing decks and other kindred purposes. A valve may be inserted to prevent ingress of water when not desired or when the vessel is running where there are foreign substances which it is desired to keep from the pipes.

VEHICLE-TONGUE SUPPORT.—George Allen and Joseph Sandhofer, Auburn, Placer county, No. 456,321. Dated July 21, 1891. The object of this invention is to provide a simple and effective support for the poles of vehicles, adapted to be readily attached to and released from the pole, and not liable to get out of order or be in the way. It consists of a bracket adjustably secured to the under side of the pole, a spring having its forward end fitted loosely in the bracket and a bearing-plate secured to the axle, having its front end extended and inclined upwardly to form a support for the spring.

SASH BALANCE.—Axel Johnson, Oakland, assignor to the Marshall Improved Window Furniture Co., of S. F. No. 456,492. Dated July 21, 1891. This invention relates to that class of sash balances in which a spring is let into a bore in the sash-rail and actuates and is actuated by a pinion which engages a rack on the window-casing. The present invention consists in a new and useful improvement in the spring, and in a novel arrangement providing for a pinion on each side of the sash engaging a rack on each side of the casing. The inner portion of the improved spring—that is to say, that portion which returns on the inside of a smaller sized wire or rod than the outer portion. There are many important advantages which result from this present improved construction of the spring.

BABY CARRIAGE.—Salome P. Davis and James H. Dicks, San Jose. No. 455,909. Dated July 14, 1891. The object of this invention is to provide a simple and effective means for locking the wheels of the carriage in order to prevent it from rolling when unattended. Baby carriages are often released by the attendant for a greater or less time, and allowed to stand. Upon city sidewalks especially, which are always sloping, the carriage will roll down by gravity, and accidents from this cause are not infrequent. This invention prevents any movement of the unattended carriage by securely locking its wheels.

WAY-UP MINES.—There are in the Andes, Peru, two mining camps which are higher up than any in this country. These are Vicharayao, 15,950 feet, and Mnoapata, 16,158 feet and more above the sea level, each with a population of miners averaging 200 the year around. High as some of the points are on the Panama Oroya railroad of Peru, of which the Galera tunnel is the summit, that road will be surpassed by the narrow-gauge railroad now under construction to connect with it. This, when completed, will have a length of 75 kilometers and a mean altitude of 15,350 feet. In one of the mines a tunnel is being driven at a higher elevation than Galera, which, when completed, will be fully as long, if not longer, than that tunnel. This work is being done by means of compressed air drills, and the tunnel is lighted throughout by electricity.

THE PELTON WATER-WHEEL CO. of this city writes us as follows: "It having come to our notice that our patent rights are being infringed upon, all intending purchasers are hereby warned that all such infringements will be duly prosecuted."

"REGAN VAPOR ENGINES."—These engines have met with such general favor everywhere and the demand for them is growing so rapidly that the manufacturers have been obliged to establish works upon a larger scale in Chicago for their more speedy construction. This week 27 engines of various sizes were received at the works here, where they are set up and thoroughly tested before being sent out. With three more carloads on the way, the company will be enabled to fill their present orders promptly. The "Regan Launch," with engine specially adapted for it, is attracting much attention among boating men, and is pronounced by experts the most complete and perfect launch yet constructed. A large number are already in use and giving the highest satisfaction.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

SCIENTIFIC PROGRESS.

Vital Force—What Is It?

At a recent meeting of physiologists and surgeons at Chicago, a paper was read by Dr. H. J. Treat entitled: "Vital Force the Surgeon's Best Friend," upon which quite a lengthy discussion was held, from which we extract as follows:

Dr. Haast thought the paper a most excellent one. Had no criticisms to offer, and but one query to make, and that was with reference to an "Intelligent force" that has to do with the reparative process in surgery or medicine. The vital force had been talked of as an intelligent independence or an independent intelligence, an independent entity, an intelligent entity, etc. He thought that the matter should be well considered, in order not to make ourselves ridiculous in the eyes of intelligent, thinking men and women. He did not for one moment question the existence of a vital force, but that it existed as an independent intelligence he did seriously question. Vital force in his opinion was a property of matter. He thought that Dr. A. Curtis was not far from the truth when he said that "whatever always exists in connection with matter, but has no existence without it, is called a property of matter." Inasmuch, therefore, as "vital force" always exists in connection with living matter, and has never been found to exist outside thereof or independent thereof, it must be a property of living matter, and we can know nothing about vital force aside from living matter.

Dr. O. P. Fletcher queried: "What is vital force?" He had never yet heard it defined, and would like to know what it was. Had thought at times that it was intelligent. If you can find any force, not intelligent, that could bring together bones, muscles, nerves, blood vessels and all the various parts of this human machine, and put in working order and maintain it in that condition 50, 60 or 100 years, he would like to know its name and to know more about it. In college he was taught to believe that chemical force was not to be thought of as producing any of the results witnessed in the animal economy. It seemed to him now that life could not exist without chemical action.

Dr. Pechman remarked that our bodies are mysterious. Life and soul are used as synonymous terms by some. If the soul is the life, it is different from matter. The body is the house, the soul is the occupant. When life goes out, the house is left to decay. The bioplasm of plants and animals are, so far as can be ascertained by chemistry and microscopy, the same. Some of these bioplasms go to make bone, some form muscle, others form serous membrane, some skin, and so on through the whole body. When the man dies, his body is like to Mr. Jones' house—empty—something has gone out of it. The house still contains all the elements that were found in it during life, but there is something gone. This something is not a property of matter, but, as he viewed it, an intelligence—a something separate from the living matter.

Dr. Treat concluded that we can tell what vital force is as well as we can what life is, as well as we can tell what electricity is, as well as we can tell what gravity is. They are all known by their effects upon matter. It is only a play of words to say it is a property of matter. We know it is independent by its effects.

Dr. W. A. Harris remarked that the question put him in deep water. If a bone be broken, the vital force goes to work to repair the injury and reunite the parts. It looks and acts like it was intelligent. As to its being independent, I have nothing to say. It seems to have power to resist chemical force.

In reply it was said: A tree gets bruised by the woodman's ax. The living matter, by virtue of the inherent force in it, heals the injury. Is there an intelligence there?

Dr. Treat says there is a force or forces that overcome vital force—if it were not so, we would not die. Vital force is limited in its capacity to resist chemical force.

Dr. Scroggy said if the process of digestion be chemical and there was no vital force to resist it, the stomach itself would be digested.

[It may be remarked here that the reason why the gastric juice does not act upon the walls of the stomach is because that juice is acid, while the blood is alkaline. The walls of the stomach being well supplied with blood vessels, the gastric juice cannot act upon the stomach itself because the alkali of the one neutralizes the acid of the other.—EDS. PRESS.]

Dr. Pechman said that many in the profession hold that all changes that take place in our bodies are due to chemical force, yet some of these thinkers are changing their minds in this respect. When the vital force leaves the body, the chemical forces go to work to decompose it. The natural heat of the body is produced by chemical action of changing fluids into semi-fluids—all chemical action is attended with changes of temperature.

A NEW COMBUSTIBLE.—An experiment was successfully carried out at Rome recently, which will probably mark the commencement of a new era of prosperity for the mechanical industries of Italy, and especially for her carrying companies. A train was run from Rome to Frascati furnished with a new combustible

prepared according to the invention of Signor Saporiti of Siena. It is a preparation of lignite, of which there are immense and rich deposits in Italy. It is formed of two qualities—the xilolite and the schistos—of which the latter is the richer in combustible material. The train ran easily and smoothly up one of the steepest gradients of Italy. The quantity of fuel used during the transit was 367 kilogrammes, as against 300 of ordinary coal. The train was a heavy one of eight carriages and luggage van, and there were 70 passengers. An English gentleman said England would witness with pleasure the success of the experiment, and the commercial emancipation of Italy. A telegram was sent to the King announcing the success of the experiment. A very brilliant gas is also to be obtained from lignite. The importance of this new manufacture will be seen when it is remembered that Italy now pays from \$20,000,000 to \$25,000,000 yearly to other countries for coal, and that her supplies of lignite are practically unlimited. The smoke from the new combustible is very light and not disagreeable in odor.—*Chemical Trade Journal.*

The Edison Cosmical Telephone.

Some criticism has been attempted in regard to Edison's proposed cosmical telephone. It has been asserted that Mr. Edison "displays an ignorance of the principles of physics," in supposing that detonating disturbances in the sun can be heard through his cosmical telephone "while he waits"; because the movement of sound is so slow that it would require years to pass from the sun to the earth. The critics, however, have themselves manifested "ignorance" in regard to the principle upon which Mr. E. expects to receive those sounds. The "waves" through which Mr. E. expects to receive sounds from the sun are not "sound waves" but "electro-magnetic waves," which latter move with the velocity of light, and light requires only eight minutes to pass from the sun to the earth.

Solar disturbances give rise to electro-magnetic waves, which in turn are well known to cause magnetic disturbances on the earth, and it is Mr. Edison's expectation to change those magnetic waves into sound waves by means of his cosmical telephone; or at least to thereby make such waves audible. The movement of sound is not confined to the ordinary sound waves as produced in the atmosphere, as is proven by the ordinary action of the telephone. If a person speaks into a telephone at San Diego, he would not expect his friend to wait in San Francisco an hour for the sound to reach him. The well-known fact of the direct and almost instantaneous influence of solar magnetic disturbances upon the earth furnishes abundant evidence of direct electric communication between the two bodies, which line of communication Mr. Edison is endeavoring to take advantage of. These solar disturbances it is supposed will set up a varying electric current in Mr. Edison's wires with which he is surrounding his iron mountain, which passing through the helix of his telephone receiver, will cause its diaphragm to vibrate and thus convert the magnetic disturbance into audible sound.

This line of inquiry is certainly a most philosophical one and one of high scientific interest. The world will wait with impatient but hopeful interest for the final result.

TEMPERATURE TESTS IN BORED WELLS.—The method of taking tests of temperature in deep wells is shown in a late report of some tests taken by Mr. H. Halleck of the American Government Geodetic Surveying Corps, in the Boggs' Run well of the Wheeling (Pa.) Development Company. The well is now down to a depth of 4500 feet. The temperature tests at the well are taken twice a day, at 9 A. M. and 5 P. M. Reports from the different points in the well are secured by suspending three buckets, each 500 feet from the one next to it, in the well at one time. Each bucket is of copper, about 20 inches deep, filled with water in which two maximum thermometers are suspended. The buckets, which fit snugly to the sides of the hole, remain stationary for about 12 hours, and the heat from the surrounding strata in that time communicates itself through the buckets of water to the thermometers, where it is recorded. The highest temperature yet recorded is 110° Fahr., at the bottom of the well, and the average increase of heat has been found to be about one degree for each 78 feet of descent.

RAPE OIL.—According to the authors, rape oil consists of the glycerides of three distinct fatty acids, one of which, melting at 75°, occurs only in very small quantities. The other two, erucic acid and a liquid acid which the authors name rapinic acid, are present in equal quantities. Lead erucate is readily soluble in hot ether. The zinc salts of the fatty acids can be separated by means of ether.

PERSISTENCY OF ODORS.—When the mosque of St. Sophia, in Constantinople, was built, more than 1000 years ago, the stone and brick were laid in mortar mixed with a solution of musk, and the building, it is said, has been infected with the odor ever since. Probably age has imparted a musky odor from which the musk story was fabricated.

The earth is the greatest distance from the sun on the morning of the 6th of July.

MECHANICAL PROGRESS.

Stephanite—A New Alloy.

We recently drew attention to a process which promises well for the production of a new class of metal. This process consists in adding to iron or steel a certain proportion of aluminum, by which their characters are rapidly and very completely transformed, and their respective qualities greatly improved. Of course there is nothing new in this alloy, but there is everything new in the way it is manufactured by the process under notice. In adding aluminum to iron in the cupola in the ordinary way, the blast drives it off, and so the attempt is fruitless. So it has generally to be added in the ladle, stirrers being employed to secure the incorporation of the aluminum with the iron; but this, after all, is found to be only a mechanical mixture, and does not produce a reliable homogeneous alloy. The means of promoting the chemical mixture of the metals formed for some years a careful study with Mr. Stephan, of Birmingham, who unfortunately died a few months ago, before his invention had practically arrived at fruition. Mr. Stephan's idea was to form a flux of the raw material from which aluminum is made and to add it to the charge of iron in the cupola. In this way he had been successful in obtaining a chemical incorporation of the aluminum, and in securing some remarkable results. This flux, to which the name of "Stephanite" has been given, consists of alumina, emery and lime in certain proportions. They are incorporated and formed into briquettes. When the cupola is being charged with iron and coke, the briquettes are broken up, and about 80 pounds weight of the flux is added for each ton of metal. The high temperature of the furnace converts the alumina into metallic aluminum gases, which are absorbed by the molten metal in statu nascendi, and thus a complete chemical compound is formed. It is claimed for the flux that it acts as a clearing agent on the metal and draws every particle from the slag; that the molten metal comes from the furnace in a more liquid state than it has hitherto been found possible to obtain; that in consequence of this liquidity better castings are obtainable, and that, owing to the metal remaining at a high temperature for a considerable time, no blow-holes are formed. It is also claimed that by varying the proportion of the flux per ton of iron different results can be produced, that is to say, iron of different degrees of hardness and toughness can be made.

These claims were practically substantiated on Monday last, June 29, at Messrs. H. Young & Co.'s Foundry, Ecclestone street, Plimlico, in the presence of a number of gentlemen interested in metallurgical questions, including several from the colonies. Messrs. Young & Co. had only had Stephanite under trial experimentally at their works for about a week, but so satisfied were they of its merits, that on the day in question they placed their whole foundry at the disposal of the Stephanite Co., of Blomfield House, London Wall, all the castings being run from iron treated with Stephanite. Upon the occasion in question the cupola was charged with three tons of very poor cast-iron scrap, to which was added 240 pounds of Stephanite. The superior fluidity of the metal was evident directly after the cupola was tapped, and was further shown as the runs were made. After being allowed to set, some of the castings were taken out of the moulds and plunged at a dull red heat into cold water. With ordinary cast iron this treatment would have meant practical disintegration, either at the moment or when the metal received a blow. But disintegration took place at neither time with the new metal. When cold, one of the castings was broken in halves and showed a very good steely fracture. These castings resisted the file very completely. One of the halves of the broken casting was then heated to a cherry red in a smith's forge and then allowed to cool in the air. On again trying it with the file it was found quite amenable to its action. It was then placed in the forge, reheated, and again plunged into cold water, and when cool was tried with the file and no impression could be made upon it. The most important feature of this flux appears, however, to be that by its addition it is stated that wrought iron scrap can be reduced in an ordinary cupola, and owing to the free run and remarkable fluidity of the metal steel castings of the finest temper may thus be produced. The inevitable conclusion is that Mr. Stephan's method of incorporating aluminum with iron is a practical success, producing a metal combining the qualities of both iron and steel. This being so it follows that a wide field lies open for its application in many important directions. Beyond this Mr. Stephan has certainly added another and an important chapter to metallurgical science.—*London Iron.*

[To prevent confusion some other name should be given to this alloy to distinguish it from the mineral "Stephanite."—EDS. PRESS.]

A NEW STYLE OF CHAIN has been invented, which is cut directly from a bar of steel so that the links have no welds. In allusion to this improved mode of manufacture, a contemporary says: The manufacture of chains has been very much facilitated by the introduction of electricity for welding purposes, but a London firm has gone a step further and produced a chain which required absolutely no welding.

This is done in a most ingenious way. A cross-shaped bar of steel is drilled at proper intervals with holes, the size of which are dependent on the size of link required. The bar is then notched roughly to the shape of the links by suitable machinery, after which it is flattened to prepare it for the hollowing out of the links and their rounding up by stamping. In the next stage the links are punched through and parted, and the concluding operation is the cleaning and truing up of the links to their final form. The makers claim that the chains are considerably stronger than those made in the usual way. Apart from the possibility of defective welds, the fact that the new chain is of steel gives it a great advantage over ordinary chains, which, on account of difficulties of welding, are usually made of iron. It is stated that the new steel chain can be made equal in strength to the ordinary chain at a third-class weight.

CLEANING CAR WHEELS BY SAND.—We have heard but little of late in regard to the sand blast, but an exchange just received notices quite a new application of an important invention. Our contemporary says: A very efficient application of the sand blast is made in cleaning newly cast car wheels in the New York Car Wheel Works, Buffalo, N. Y. When taken from the soaking pit the wheel is rolled into a small chamber, where it stands in a vertical position. The tread of the wheel stands on rollers, which are moved by gearing so that the wheel is slowly revolved without changing its position. A fine, into which cinders are fed by a chute leading from a bin above, leads a blast of air against the face of the wheel, which is then reversed. The cinders used vary from the size of a grain of wheat to much larger, and are used over and over. With this apparatus one man can clean 20 wheels in three hours and a half, including the time consumed in rolling them to and from the machine. The cost is less than hand labor and the cleaning is better done.

THE MANUFACTURE OF HEAVY GUNS.—The manufacture of the immense guns required for modern service is a most interesting process. The rifled guns are made by re-enforcing the tube with rings and repeated layers of steel called jackets, which are fitted one over the other over the original tube or barrel of the gun. The exact size of the jacket and ring when heated so that it can be put in its place must be a matter of the closest mathematical calculation. The powder makes such havoc with the rifling of the largest guns that 100 charges are about all that can be expected from them. The jackets and rings can then be removed and fitted to another tube. The various parts of a gun are not put together at the foundry in Bethlehem, but are sent to Washington, to a department of the arsenal called the assembling room, where the tube is rifled, and the gun is finally completed. A steel gun of the largest caliber costs about \$100,000.

WHAT TO DO WITH DISHED WHEELS.—A newspaper reporter recently noticed a wheel of a two-wheeled road cart suddenly caught between two loose paving blocks in such a manner that it was instantly dished. While the owner was looking ruefully at his wheel, which was a new one, a policeman came up, and, calling on two or three onlookers to assist him, succeeded in pulling the tire into place and setting the wheel up as it had been. The owner, after thanking him, got in and drove off. "That is something that more huggy owners ought to know. If a wheel is dished without breaking the spokes off, it can easily be sprung into shape if three men will tackle it, and, catching hold of the tire at various points, give it two or three good strong pulls. That, said the policeman, makes five wheels that I have straightened that have been dished on this very corner."

STEAM ROAD CARRIAGES.—It is singular, says a contemporary, that when a steam carriage was made by Oliver Evans, of Philadelphia, nearly a century ago, no later attempts have been made to develop that line of invention. Steam engines have been applied to every other purpose conceivable, even to flying, but not to carriages for common roads until quite recently, when a French engineer has made one that is attracting a good deal of attention. There are, it is true, a good many obstacles such as the noise of the exhaust and heat, also the danger in crowded traffic, but these impediments can, no doubt, be overcome when steam carriages are known and wanted. Invention in this line is much more promising than that devoted to rotary engines, flying machines and many other schemes, in which large amounts of money are expended each year.

SHIP-BUILDING IN SAN FRANCISCO.—Having shown that war ships can be built in San Francisco, says a contemporary, it will soon be demonstrated that peace ships can be built as well, as a contract has been let for the construction of a 4000-ton iron steamer for the Pacific Mail Company, for use on the China route. The new ship is to be a fast vessel, her speed being promised at not less than 16 knots an hour.

OLD RAILS IN CAST IRON.—It is said that old rails will mix well with cast iron, giving strength and cleanliness, but usually around a foundry there are no appliances for cutting them into suitable lengths to admit of being placed in the cupola.

USEFUL INFORMATION.

Industrial Brevities.

Revolutions of all kinds, political, financial, commercial, manufacturing and social are threatening all over the world. The greatest revolution concerning which the least is said and the least understood is that revolution which will, when accomplished, bring about an enlarged consumption of all kinds of manufacturing products. It may seem strange to say it, but the world, that is the common world, is learning to eat more, wear more, live in better houses, and use more machinery. This revolution is extremely important in all its significances. Even in Europe, where habits of centuries have become fixed, there is a breaking away from old methods and ideas, expansion of demand, and a determination to have more of this world's goods. The same revolution is showing itself in certain parts of East India, China and Japan. Travelling commercial agents have noted it for a year or two. The world is forming new personal habits, and establishing new ambitions.

One of the marvels of industry in this country is the rapid progress which manufacturing industry is making in our extreme Southern States. The building up of a "New South" is a positive reality. During the last ten years fully 350 cotton mills have been built in the South. The Southern output of seed has trebled in ten years. English investors are buying large phosphate beds in Florida. Cotton gins, cotton compress works, and cotton seed oil mills are being built all over the South. Woolen and worsted mills are also going up. Georgia is taking the lead in cotton manufacture. Tennessee seems to be a very prosperous State for little industries of all kinds. A wave of industrial prosperity is passing over the State of South Carolina. One of the features of building operations in the South is the number of buildings for educational purposes going up.

Northern capitalists have invested a million dollars to cultivate a 112,000 acre farm in Florida, raising coconuts and sugar cane. Petroleum is to be developed on a large scale in Texas by German capitalists.

So far this year 2,352,474 tons of coal is the excess over last year. All the bituminous mines are doing very well.

Notwithstanding the flurry in the markets of the world, there is a stronger disposition to put money into legitimate channels than heretofore.

The capitalization of American railroads is about \$10,000,000,000, and the annual profits, \$1,000,000,000.

Fifty-ton-wheel locomotives to weigh 70 tons each, are about to be built for a New York railroad.

An iron and steel plant to make a hundred tons of steel daily is to be built at San Diego, California.

Boring for natural gas in Stockton is an enterprise that has become too common there to excite remark. The new \$30,000 courthouse is lighted and heated throughout by gas from a well bored by the county.

The Spreckles firm of Philadelphia and San Francisco recently had 53 loaded vessels due at the latter port.

BEES AND GRAPES.—The charge that bees bite grapes and thus gain access to the contents of their skins has been abandoned and the culprits of the industrious little workers now assert that the bee spits upon the grape a substance which eats away the skin. Experiments have been made by smothering bees up with no food but grapes and keeping them thus to the point of starvation, but they left the grapes whole, though running all over them and extracting every atom of moisture where one was already broken. If the bee was snub an effective spitter, then was the time for him to spit for dear life, but he starved without. The spit story needs verification.—*Cerrado Mercury.*

SODA WATER IN CUTTING STEEL.—A contemporary in answering the query, why soda water used in cutting steel leaves a smoother and brighter, surface than oil, answers as follows: "Because the soda water being more fluid than oil flows to the cutting edge of the tool and lubricates the cut. The soda as an alkali gives the water a greater affinity for the oily surface of both the tool and the steel, and causes it to flow between the point of contact of tool and metal. Its cooling power is also greater than that of oil, which can be seen by the heat carried off in vapor at the point of cutting."

PUTTING OUT FIRE WITH SAND.—In connection with the equipment for fire protection, of wood-working establishments, it is recommended that a gallon pail filled with fine sand, be always placed within convenient reach of each workman employed where oiling and finishing is being done. This practice might well be followed wherever there is a possibility of fire starting in oils or oil-soaked materials. There is nothing which will smother an oil-fed fire in its incipency more quickly and effectually than sand—and there are no afterlaps in the way of water drainage either.—*Fire and Water.*

LIGHTNING striking a dwelling in Belpre, Ind., strange to say, horned the gilt figures of the wall-paper without harming the white ones in the least.

GOOD HEALTH.

Freckles—Their Cause and Cure.

The annoying presence of freckles usually makes its appearance for the first time in summer. Freckles are always most marked in the summer months, but are seldom met with on portions of the body not exposed to the direct action of the sunlight. For these reasons, it is generally supposed their presence is due to the action of the sun's rays, although the precise mode of causation is not well understood. They often appear as early as the third or fourth year of life, and generally vanish with advanced age. Persons of fair complexions are most liable to them; but dark complexioned people are not always exempt. Their appearance is supposed to be due to an abnormal deposit of the natural coloring matter of the skin. Very likely much exposure to the sun under certain predisposed conditions of the subject leads to this increased deposit of coloring matter.

Their Removal.

Freckles may be rapidly removed by applications of snob strength as will give quick rise to the formation of minute blisters. The epidermis forming the roof of the blister contains all the disfiguring pigment, which will disappear with the removal of the epidermis. The new epidermis which will soon form over the surface thus treated will be free from any excess of pigment, and the freckles will thus disappear. But this process is not advised. It is quite too heroic, and its benefit will be only of short duration. Moreover, it may result in permanent injury to the skin, especially if the treatment is entrusted to unskillful hands.

Better results may be derived from milder and more prolonged treatment. Various ointments have been recommended which contain stimulating substances, that act by exciting a rapid formation of the superficial elements of the skin and their corresponding rapid scaling off (exfoliation). But even snob remedies should be applied only under the observation and advice of a competent medical man. The avoidance of sunshine would doubtless keep the development of this unpleasant appearance within reasonable bounds; but the avoidance of sunshine is attendant with so many of its own evils that it cannot be recommended. Mild remedies only are advised which will act slowly in removing the excess of coloring matter. Physicians recommend, in this direction, preparations of mercury, subnitrate of bismuth, and mild alkaline applications, such as solution of carbonate of soda or carbonate of potassium. These, variously combined with emulsions of almonds and tincture of benzoin, form agreeable remedies, which will have the desired effect if perseveringly used.

A Special Remedy.

A prominent physician of Brooklyn, New York, has prescribed an application for years and finds it more effective than anything else which he has recommended in his practice, says the *New York Recorder*. Here it is: One dram muriatic acid, three gills rain water, half-teaspoonful of spirits of lavender. Mix thoroughly. It should be applied twice the first day and then three times a day until the freckles disappear. At rising, before lunch and on going to bed are the best times for applying. Exposure to the sun and wind should be avoided as much as possible, and for some days a veil should be worn by the "patient" when she is out of doors. The mixtures should be applied directly to the freckles with a bit of soft linen or with a camel's-hair pencil. A very tender skin may at first be somewhat irritated, in which case an extra gill of rain water should be added, and a little cold cream used on retiring.

MICROBES OF THE STOMACH.—These conclusions are reached by Dr. Kianonski: The empty stomach of a healthy man contains innumerable organisms. The gastric juice, and principally the hydrochloric acid, possesses microbicidal properties. The microbes take no active part in digestion. Persons who on account of some affections secrete little hydrochloric acid are easily intoxicated by means of the micro-organisms in the stomach. Therefore, the stomach should not remain in an empty condition for any length of time, and during an epidemic food should be taken at frequent intervals, and, if possible, sterilized.

SCIENCE OVERCOMES DEAFNESS.—Just now the medical world is engaged in devising the new device for deafness called sound disk. No invention of late has attracted so much interest among the medical profession. Its perfection, which is now an established fact, has resulted in the overthrow of many pet theories of there being no relief for a vast number of cases of deafness. This ingenious discovery was made by H. A. Wales of Bridgeport, Conn., and coming as it does with the approval of some of the leading aurists of the world, it can hardly fail to prove of great value to both the profession and the afflicted.

TO FEED AN ORANGE to a sick person, cut it in half, crosswise; then, with a spoon, take out the fleshy part, containing the juice, rejecting the seed.

COOL THE BLOOD by drinking cold water in which a little pure cream of tartar has been dissolved.

ENGINEERING NOTES.

A STEAMSHIP STACK 120 FEET HIGH.—The latest plan to improve the draught of the furnaces of ocean steamers is to increase the height of the smoke pipes. The new steamer *Scott*, of the Cape Mail Line, is provided with smoke stacks 120 feet high above the grates, being the loftiest pipes ever put into a steamer. A draught of 3 inch water pressure is thus obtained, all the steam needed is easily secured, and the use of fans is dispensed with. Her speed is 19 knots. This steamer is 502 feet long, 54 feet 6 inches beam, 37 feet 6 inches deep. Tonnage 7,000. Built of steel. Fourteen watertight compartments, twin screws, 8,000 horse power engines, two sets of triple expansion engines, 34½ inches, 57½ inches, 92 inches by 60. The success of the tall chimneys of the *Scott* will probably lead to the trial of even higher pipes. The above vessel could not clear the floor of Brooklyn bridge, which is 119 feet above high water. If our great war steamers should be piped in accordance with the latest and best engineering practice, they will be debarred from the Brooklyn navy yard, unless they approach from the Hell Gate side of the great bridge. It was an error on the part of the Secretary of War to allow so low a floor for the bridge. At present all the larger ships are obliged to dismantle and lower their topmasts in order to pass under the Brooklyn bridge.

DESIGN FOR A VERY FAST STEAMER.—Messrs. James and George Thomson, Glasgow, have modeled a new steamer guaranteed to steam at the rate of 23½ knots an hour, which will enable the vessel to cross the Atlantic within five days. The vessel is to be about 630 feet long by 70 feet beam. The lines are very fine. The new vessel will have twin screws 22 feet or 23 feet in diameter, well supported. There are four funnels, and about 200 feet of the length of the ship is left for the boilers and hulkers. The engines are to be triple compound, with four cylinders working four cranks. They will probably indicate 33,000 indicated horse power. Accommodation is provided for 700 first and 300 second class passengers and about 400 emigrants, and all the arrangements worked out in the plans are far ahead, as far as regards luxury and comfort, of anything yet produced. The plating of the ship is carried up to the promenade deck, which runs from end to end, and a width of about 20 feet, on each side is left for walking. On the promenade deck are twelve machine guns, and in other respects the vessel is made suitable for an armed cruiser.

AN IMPORTANT TUNNEL.—The greatest engineering feat in the history of the anthracite coal mining is about to begin. It is the commencement of what will be known as the Jeddo Tunnel, which will be driven for the purpose of draining the flooded mines of Jeddo and Harleigh. It will be constructed from Butler Valley, Pa., to the bottom of Eberwade mammoth vein, a distance of three miles, through solid rock, to be eight feet square in the clear. The scheme of tunneling through the mountain first occurred to John Markle, who is to be president of the company, which will bear the title of Jeddo Tunnel Co., Limited. It will open an inexhaustible supply of coal and furnish employment for thousands of people for many years to come. It will also serve the double purpose of draining all the collieries in the valley.

ENGLISH AND AMERICAN SHIP BUILDING.—Mr. Charles H. Cramp is authority for the statement that it is entirely out of question for an American shipbuilder to duplicate exactly a British ship or follow out British specifications and plans, because American vessels are in advance, and there is no comparison when the outfit of the vessel is considered. Another important point which he makes is the fact that when a foreign shipbuilder is asked to duplicate an American ship, or build entirely on American plans, he always asks as much as an American builder. The whole summing up means that a contract for an inferior vessel will not be undertaken in England on competitive terms; but that our builders stand ready to duplicate first-class steamers at the same cost as abroad.

NIAGARA FALLS.—The utilization of the power of Niagara Falls is a fruitful topic of discussion in engineering circles. It is estimated that in supplying 120,000 horse power the depth of the water passing over the falls will be lowered about an inch, a mere trifle compared to the vast volume that leaps into the abyss below. Some idea of what 120,000 horse power means can be gleaned from the fact that large locomotive works in the East, giving employment to four or five thousand men requires 2500 horse power to drive the machinery.

PNEUMATIC TUBES.—It is proposed to establish mail tubes between Brooklyn and New York. This plan will be a good one, if it will cut down by about 36 hours the time of the mail between the two cities. Under present arrangements, a letter mailed in Brooklyn gets to New York any time within the next three days.

The Russian Government will spend 200,000,000 in building and equipping the Trans-Siberian railway.

ELECTRICITY.

ANTIQUITY OF THE ELECTRIC LIGHT.—Those who suppose the electric light to be a production of the present decade will be able to correct their apprehension of the subject after reading the following item from the *Scientific American* of Dec. 9, 1843: "The inventors of a new electrical light, exhibited at the Western Literary Institution, Leicester Square, London, on its recent reopening under the new auspices, expect, it is said, to apply it generally to shop and street illumination, and they state that while the conveying will cost no more than gas, the expense of illumination will be one-twelfth the price of the latter light. The current of electricity in passing through the two pieces of charcoal which form the poles of the circuit, and are excluded from all access of air, gives, in this case, it is said, an intense and beautiful white light, with the effect of daylight to a much greater extent than the lime does, and having this advantage, that it is sustained and continuous. If Messrs. Staites & Petrie can thus produce a steady and sustained light, they have accomplished what has hitherto been the sole preventive to the substitution of galvanism for gas. The *Mechanics' Magazine* states that this one light completely eclipsed ten gaslights and an oxyhydrogen. The gas companies had better look out. The dissatisfaction of the public with their mismanagement may have begotten a rival destined to eclipse many more than merely ten of their gaslights."

ELECTRICITY has been pronounced a success in capital punishment. Thus this country leads the world in an important feature of its penal system. This is the successful result of a movement begun years ago, when a commission of experts was appointed to investigate the subject with a view of finding some method of putting criminals to death less barbarous than hanging. No doubt other States will soon follow the example of New York, and in time England will substitute it for the gallows, France for the guillotine, Spain for the garrote and Italy for the sword. Electricity is destined to become the motor power of the world and the means of illumination, as it already is the agent of communication. Why should it not become in time the universal method of inflicting the death penalty?

AN EXTENSIVE ELECTRIC RAILWAY.—A high-speed electric railway is to be built between Chicago and Milwaukee, a distance of 85 miles. One of the projected systems of rapid transit in New York will cost \$50,000,000 for an 18-mile road. A speed of 40 miles an hour can be attained, and a 300-horse power electric locomotive will be used. In this connection, it may be stated that a ten-ton electric locomotive is being built at Lynn, Mass. If a ten-ton locomotive can be built, so can a 20-ton. The simplicity of mechanism and the total absence of all reciprocating parts makes the electric motor peculiarly adapted to the operation of a high-speed car, and to these features its decreased weight, in comparison with the steam locomotive, lends additional value.

AN ELECTRIC TRICYCLE.—There has been considerable discussion of late on the probable usefulness of an electric tricycle, and it is stated that the invention of such a machine is now an established fact. This, according to report, has been effected by the use of a form of storage battery much lighter than the kind hitherto used. Several of these placed in a light box are sufficient to drive the machine with an ordinary lad about 100 miles at the rate of eight miles an hour. The elements of the "active material" are supposed to be carried by the rider, and the batteries can be recharged whenever water is available.

ALTERNATE CURRENTS.—An electrician has recently completed some very important experiments on the physiological effects of alternate currents. He finds that the danger of the current diminishes as the number of alternations per second is increased. Thus it took 20 times as strong a current to kill a dog when the alternations were 4500 per second as when they were 120 per second. When the alternations were 300 per second, the current was only half as dangerous to life as when the alternations were 100.

DOVER, N. H., is one of the few towns in the country that operates its electric street railway system without the aid of a steam engine. The Salmon Falls river, which flows near the town, turns a 500 horse power water-wheel, which supplies power for the dynamos that operate the street line, the electric lights in the place, and electricity for several neighboring towns as well.

WHY IS IT SO?—Is it not a little strange that those who are so strongly opposed to the introduction of electricity for lighting purposes, because it is dangerous, still continue to use gas, which, according to statistics, causes many times more deaths than the electric current?

ELECTRIC MOTORS.—There are now running in Brockton, an inland town of Massachusetts, about 150 electric motors for shoemaking and other purposes.

BRUSSELS, an inland city, is ambitious of becoming a seaport. The plan is to build a ship canal from the North Sea.

TABLE OF CONTENTS.

EDITORIALS. — A New Electric Road; Geared Shapers, 65. Passing Events; Modern Mechanical Construction; Platinum in California; Safety-Caps for Powder Kegs; The World's Fair; New Books; Oregon Again to the Front, 64. Condensation of Coke-Oven Gases, 65.

ILLUSTRATIONS. — Improved Trips-Ceared Shaper; Elevation of Condensing and Purifying Apparatus for By-Products from Coke-Ovens, 65. Condensation of Coke-Oven Gases Illustrated, 73. Gigantic Red Cedar, 67.

CORRESPONDENCE. — Our Mining Interest and the World's Fair; Freight on Ores, 66.

MISCELLANEOUS. — The Precipitation of Metals from Hypophosphite Solutions; Results from Free Coinage, 66. Gigantic Red Cedar; The Overmountain Rain Racket; Postal Telegraphy; The Storage Battery Patent, 67.

SCIENTIFIC PROGRESS. — Vital Forces — What Is It? A New Combustible; The Edison Chemical Telephone; Temperature Tests in Bored Wells; Rape Oil; Persistence of Odors, 70.

MECHANICAL PROGRESS. — Steamships — A New Alloy; A New Style of Chais; Cleaning Car Wheels by Sand; The Manufacture of Heavy Ovens; What to Do with Dished Wheels; Steam Road Carriages; Ship-Building in San Francisco; Old Rails in Cast Iron, 70.

USEFUL INFORMATION. — Industrial Brevities; Bees and Orapes; Soda Water in Cutting Steel; Putting Out Fire with Sand; Miscellaneous, 71.

GOOD HEALTH. — Freckles — Their Cause and Cure; Microbes of the Stomach; Science Overcomes Deafness; Miscellaneous, 71.

ENGINEERING NOTES. — A Steamship Stack 120 Feet High; Design for a Very Fast Steamer; An Important Tunnel; English and American Ship-Building; Niagara Falls; Pneumatic Tubes; Miscellaneous, 71.

ELECTRICITY. — Antiquity of the Electric Light; Electricity; An Extensive Electric Railway; An Electric Tricycle; Alternate Currents; Miscellaneous, 71.

MINING SUMMARY. — From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 68-69.

MINING STOCK MARKET. — Seen in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 76.

MARKET REPORTS. — Eastern and Local Metal Markets; Coal and Coke, etc., 76.

Passing Events.

The driving of the last spike on a local electric road this week is an event of moment, since this is the first of this type of roads to be built on the San Francisco peninsula, and will, when completed, be one of the longest electric lines in the United States. It is not yet in operation, but will shortly be.

The discovery of asbestos in Oregon is not of so much note as the steps being taken to work the deposit or ledge. There are numerous deposits of this mineral in this State, but few of them have been properly opened. It seems difficult to find large quantities which are up to the standard required by the manufacturers. The Oregon deposit will be worked vigorously from all accounts.

There is very little new to report concerning the gold industry of California. The quartz interests are moving along in a prosperous condition. The drift mines are being steadily worked, and in hydraulic mining nothing is being done except in the extreme north. There is no immediate prospect of the increase of the gold output of the State, but neither is there any danger of a decrease for the present.

An electric railway from San Jose to Redwood City is the latest franchise to be applied for at San Jose.

POLISHED plate glass is being used in Germany to replace lithographic stones.

Modern Mechanical Construction.

The result of the civil-service examinations for master mechanics and mechanics at the Mare Island Navy Yard did not show very brilliant results for local skill.

With reference to certain trades involving special training in building the hulls of modern steel war vessels, the board states that, in its opinion, none of the candidates presenting themselves possessed the special knowledge desirable. The trades referred to are as follows:

Master Shipwright—None of the candidates appearing before the board are fully qualified for the position, owing to their ignorance of iron and steel ship-building.

Master Shipfitter—None of the candidates appearing before the board evince that knowledge of machinery or machine tools that is desirable for this position, most of the candidates being plate iron-workers.

Master Shipsmith—None of the candidates appearing before the board evince that knowledge of modern smithwork in steel ship construction that the board deems desirable.

Master Plumber—None of the candidates appearing before the board evince that knowledge of plumbing and ventilation desirable in modern naval construction.

In view of these official statements concerning prevailing ignorance of modern work, it would be well for some of the younger men in the crafts to more thoroughly post themselves. One trouble with these people is, they are not readers. They potter along in the same old groove, and do not take the trouble to find out how the lines are advancing in their own trades.

If these men would regularly take and read one or two good mechanical journals, and buy a few of the many technical hooks, they could add to their practical knowledge much that would be useful to them.

There are four departments in which no first-class man appeared, and yet each is an important and leading branch. Of course, special training is necessary in building the hulls of modern steel war vessels, but as these vessels will continue to be built, the special training should be gained as soon as may be. If those now here do not qualify themselves, others from the East and abroad will replace such as are incompetent.

The mechanics of to-day to be abreast of the times should read more than they do. There are plenty of class publications, well edited and prepared, but they receive little support from the mechanics themselves. The "beases" in the trade patronize such journals, but the workmen as a class, seem to care very little for additional knowledge. They do not bother themselves to read of progress even in their own line. They expect their employers to tell them what to do. This is an unpleasant fact, and to this carelessness is due such incidents as recorded in the case of the examinations at the Navy Yard.

Platinum in California.

The chief source of supply of platinum is from the Ural mountains, in Russia, just as it has been for the past 25 years. The other sources of supply are not constant, except that portion which is held by the French in La Republica de Colombia, South America, whence a small amount is regularly received.

The only production in the United States is from California and Southern Oregon; mainly from this State. It is the result of the occasional saving of small placer mines. It consists principally of plat-iniridium, and also contains much iridosmine, some of which is separated for pen points, but the rest is melted in with the platinum.

It has been maintained that the price of platinum has been too low for many years; that platinum has been regarded as a tailing or refuse from gold placers, and therefore the cost of production has not been charged against.

It is pretty certain that if platinum were mined and worked out in the same way as gold, and the cost of producing and refining charged to the metal, it would cost as much as gold.

There is not such a very great difference now, as the metal has increased in value of late. This should stimulate the production of platinum in connection with placer gold mining in California. Too many miners are apt to overlook this important metal. Much of it is allowed to escape simply for want of care. At the advanced price now ruling, miners who are engaged in surface workings should look after their platinum closely and save all they can. It is very scarce and brings a good price, being always in demand.

Safety-Cap for Powder Kegs.

Wm. Mahoney of Santa Cruz has patented through the MINING AND SCIENTIFIC PRESS Patent agency an improved safety-cap for powder kegs, which consists of a disk or plate having tongues upon opposite sides, said tongues being adapted to lock into the sides of the opening which the disk is intended to cover. The top or end of the metallic powder-keg has an opening made through it. This opening is circular, with the exception of a short distance upon two opposite sides, where an inwardly extending portion occupies a small part of the circumference of the opening, and these two edges are raised slightly above the level of the rest at the opening to allow the lugs of the closing-cap to pass beneath them. The cap intended to close this opening is stamped out of soft zinc or other metal and has a circumference larger than the hole, so that, if made in the form of a complete disk, it would entirely cover the hole and approximately fill the countersunk depression which is made in the top of the keg surrounding the hole. At the sides of the disk, which correspond with the short inwardly extending portions of the hole, tongues are formed by simply cutting out a triangular section upon each side. The plate is then bent into segmental or semi-cylindrical form, and the ends of the projecting tongues are introduced beneath the inwardly extending portions of the sides of the hole. By pressing upon the inwardly curved portion of the cap after these tongues are thus introduced the cap will be flattened down and the tongues will lie beneath the inwardly extending portions, and the corners or angles which have been cut out of the plate on each side allow the plate to be flattened down, so that it entirely covers the opening into the keg, thus forming a securely locked cap, which can only be removed by again bending it into the semi-circular form by means of any suitable tool, which may be introduced beneath the overlapping edges of the cap. The inwardly extending portions at each side of the hole, and beneath which the tongues of the cap are locked, are forced slightly upward in stamping out the head and the hole so that the tongues of the cap will readily pass beneath them and at the same time allow the cap to lie perfectly flat upon the top of the keg when pressed down to its seat.

The World's Fair.

It cannot be said that any very active steps have yet been taken by this State toward preparing for the Chicago World's Fair. The Legislature appropriated \$300,000, but the State Controller makes some difficulty about getting any of the fund for the present. A few individuals are making preparations and the State Commission is considering the offices, but as for collecting material, or arranging for its collection, little is being done. The State Commission this week passed the following resolutions:

WHEREAS, In order to secure uniform effort throughout the State of California in the various counties in arranging their exhibits for the World's Columbian Exposition, it is necessary to perfect organizations in each of the counties formed on the same general plan; and

Whereas, In order to make this Commission the channel through which all information shall pass with regard to all exhibits, both in the State building and in the general exhibition buildings, it is expedient to suggest a plan under which such organizations shall be formed; therefore be it

Resolved, That this Commission proceed at once to the work of forming a World's Fair Association in each county of the State, and that a set of by-laws or form of government be suggested by this Commission for each of such associations; and be it further

Resolved, That the Secretary be authorized and instructed to draft a plan at once, to print and distribute sets of by-laws in accordance with such plan, and have engraved and distributed certificates of membership for the use of said county associations, charging therefor a sufficient sum to cover all costs to this commission.

The active and energetic leading men in the various counties should take time by the forelock and consider what shall be done. There is no time to be lost. Each county to be well represented will have to have wide-awake committees who show an interest in the work.

Meantime while there is considerable talk about candidates for the office of Chief of the Horticultural Department, we do not note any remarks before the Commission concerning a mining display.

New Books.

The "Young Engineer's Own Book," by Stephen Roper, contains an explanation of the principle and theories on which the steam engine as a prime mover is based; with a description of different kinds of steam engines, condensing and non-condensing, marine, stationary, locomotive, fire, traction and portable, together with instructions how to design, proportion, repair and run all classes of steam engines. There are also tables and formulae for finding horse power, suggestions for care and management of engines, etc. This little work is for the use of educational institutions where students are intended to engage in mechanical pursuits, and for the private instruction of youths who show an inclination for steam engineering. The book is published by Edward Meeks of Philadelphia, and for sale by Osborn & Alexander of this city: price \$3. It is one of Roper's practical hand-books, substantially bound and of such form that it can be carried in the pocket. The information is in a condensed but readable form, elementary in its nature.

Another new work, by the same author (Stephen Roper), is "Roper's Engineer's Handy Book." This contains full explanation of the steam-engine indicator and its use and advantages to engineers and steam-users, with formulae, facts, figures, questions, tables, etc., for engineers who wish to qualify themselves for the U. S. Navy, revenue service, mercantile marine, or to take charge of the better class of stationary steam engines. This is the 11th edition of this work, which is intended to inform people how to take care of and manage engines intelligently and to furnish a plain, practical treatise. The plainest language is used and as few mathematics as possible. In the discussions brevity has been adhered to, everything being condensed. The work is well illustrated and printed, and in flexible binding suitable for the pocket.

"Retaining Walls for Earth" is the title of a book by Malver A. Howe, published by John Wiley & Sons. This is a revised and enlarged second edition. It includes a discussion of the theory of earth pressure as developed from the ellipse of stress, with an appendix presenting the theory of Prof. Weyrauch. The values of various co-efficients have been computed and tabulated, very materially decreasing the labor of substitution in the formulae. The introduction of a brief treatment of the supporting power of earth in case of foundations, as well as formula for determining the breadth of the base of a retaining wall, should prove acceptable. The work is one of great value to the educated engineer.

Oregon Again to the Front.

"Why, young man, we have got a whole mountain of that stuff up at my place," was a remark made about one year ago by a farmer living in Josephine county, Oregon, to a gentleman who was showing crude asbestos from which the asbestos roof paint is made.

Little did the gentleman who made the above remark think that within a twelvemonth it would lead to the discovery of one of the most extensive beds of this valuable mineral that has yet been found, and that it would likely open an entirely new manufacturing interest for the State of Oregon.

Such, however, was the case. The remark was made to Mr. G. W. Bacon, who at once investigated the matter and made a filing. Mr. A. Tyler, of Forest Grove, a prospector of much experience, who was in the neighborhood looking after other mining interests, had his attention called to the find, and at once set about investigating it. The work was done very quietly and thoroughly, and has resulted in Mr. Tyler's filing by power of attorney for a number of wealthy Portland gentlemen on nearly a section of land. Capitalists from Puget Sound have also become interested in the find, who, together with the Portland parties, have formed a company to be called "The Puget Sound Asbestos Company," which represents a capital stock of \$500,000. The company will have its main office at Vancouver and will take active steps to develop its property.

Machinery for the reduction of the crude material will be run by water-power, and employment will be given to about 100 men.

The asbestos comes from the ledge in strips, and about 70 per cent is pure asbestos. The vein is eight inches in width and runs continuously for about three-quarters of a mile. It is supposed that there is much more of the mineral in the immediate vicinity, and it is needless to say that there is much excitement.

Oregon has recently come to the front with the largest cave on record, and now she claims the banner asbestos mine. Nature has done nothing by halves in the State, and if the people will meet her half way, untold riches will be revealed in her mineral wealth as well as in the development of mineral springs of medicinal value, which exist in abundance, and in many other ways that will be of material benefit to the State and nation.

G. W. S.

Condensation of Coke Oven Gases.

In the PRESS of last week were given sections and plans of regenerative coke ovens used, in Upper Silesia, in connection with condensing apparatus to obtain the by-products from the

and in the side walls 1100° to 1200° C., show, as a rule, at the foot of the heating-flues, over 700° C. still. When they finally escape, therefore, from the flues, they carry so much heat that they have been further used under steam-holders with other fuels. Often (and especially

latter portion in the heating of blast. The gases, which are tolerably free from dust and ashes and give a high calorific effect, are burned in brick heating-stoves (Cowper stoves). This has furnished a remedy for the difficulty encountered in Upper Silesia by reason of the

and traversed by an intermittent current of electricity, vibrates and becomes subdivided in a series of waves having well marked neutral segments and nodes.

A CHEMICAL LIGHT NEWLY NOTED.—It has

GENERAL PLAN OF COKING AND CONDENSING WORKS AT THE PLUTO MINE, WESTPHALIA.

gases of coking. We give herewith a longitudinal section of one of the regenerative coke ovens for saving by-products, and engravings of the condensing apparatus.

At many works tar and ammonia (which latter is usually converted at once into sulphate) are separated from the coke-oven gases by condensation. But this is not by any means the last word of progress in that direction, for a whole series of by-products are obtained by means of the condensing apparatus. The gases which remain after the condensation consist essentially of light hydrocarbons, and are approximately free from oxygen and nitrogen, especially if the ovens are so well built and maintained that the entrance of atmospheric air into the coking spaces is completely prevented. These gases are further utilized in heating—primarily the coke ovens themselves, under the floors and between the walls of which they are conducted. But the gases are, after the condensation is over, so far cooled that they will scarcely ignite spontaneously, and once ignited do not continue to burn freely. Hence, either the gases or the air which is to burn them, or both, must be pre-heated. If the ammonia from the first condensation is too weak, it is enriched on gas-washers until the ammonia water shows 3° to 3½° Beane.

The gases, the temperature of which is in the floor-flues of the ovens 1200° to 1400° C.,

in upper Silesia) the quantity of gases is so great that a small part suffices to support the coking, while the rest can be otherwise utilized. Mr. Bremme, an engineer at Jullenhutte, has succeeded in finding, after the separation of the gases, a very advantageous use for the

large amount of zinc-dust in the blast-furnace gases usually employed to heat the hot-blast stoves.

ELECTRICAL EXPERTS state that a stretched platinum wire, when heated to incandescence

recently been observed, says the New York Times that when liquid carbonic acid is allowed to escape into a stout canvas bag in the dark, and by its expansion to freeze into a snowy mass, the effect is accompanied by a pale, greenish-violet light and electric sparks.

A COMPLETE TREATISE
— ON THE —**Electro-Deposition of Metals**

Comprising Electro-Plating and Calvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermo-piles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, Proprietor of a Manufactory for Chemical Products, Machines, Apparatus, and Utensils for Electroplaters, and of an Electroplating Establishment, in Leipzig. With additions by William T. Brandt, Editor of "The Techno-Chemical Receipt Book." Illustrated by 136 engravings. In one volume, 8vo, 404 pages. Price, \$4.00, free of postage to any address in the world.

ABSTRACT OF CONTENTS:

I.—GENERAL HISTORICAL PART. Chapter I. Historical Review of Electro-Metallurgy. II.—THEORETICAL PART. Chapter II. Magnetism and Electricity; I. Magnetism; II. Electricity; Electro-Magnetism; Induction; Chemical Actions of the Electrical Current—Electrolysis. III.—SOURCES OF CURRENT. Chapter III. Galvanic Elements; Thermo-piles; Magneto and Dynamo-Electric Machines. (a) Galvanic Elements; (b) Thermo-piles, (c) Magneto and Dynamo-Electric Machines IV.—PRACTICAL PART. Chapter IV. Arrangement of Electro-Plating Establishments in General; Electro-Plating Arrangements in Particular. V. Treatment of the Metallic Articles: (a) Mechanical Treatment; (b) Chemical Treatment. VI. Processes of Electro-Deposition. VII. Deposition of Nickel and Cobalt; 1. Nickeling; 2. Cobalting. VIII. Deposition of Copper, Brass and Bronze; 1. Coppering; 2. Brassing (Culverpoll Deposit); 3. Bronzing. IX. Deposition of Silver. X. Deposition of Gold. XI. Deposition of Platinum and Palladium; 1. Deposition of Platinum; 2. Deposition of Palladium. XII. Deposition of Tin, Zinc, Lead and Iron; 1. Deposition of Tin; 2. Deposition of Zinc; 3. Deposition of Lead; 4. Deposition of Iron (Steeling). XIII. Deposition of Antimony, Arsenic and Aluminium; 1. Deposition of Antimony; 2. Deposition of Arsenic; 3. Deposition of Aluminium. XIV. Galvanoplasty (Reproduction); 1. Galvanoplastic Deposition in the Cell Apparatus; 2. Galvanoplastic Deposition by the Battery and Dynamo Machines. XV. Coloring, Plating, Oxidizing, Etc., of Metals—Lacquering. XVI. Apparatus and Instruments. XVII. Hygienic Rules for the Workshop. XVIII. Chemical Products Used in the Electro-Plating Art; I. Acids; II. Alkalies and Alkaline Earths; III. Sulphur Compounds; IV. Chlorine Compounds; V. Cyanides; VI. Carbonates; VII. Sulphates and Sulphites; VIII. Nitrates; IX. Phosphates and Pyrophosphates; X. Salts of the Organic Acids. XIX. Useful Tables. Index.

A circular of 6 pages quarto, giving the full Table of Contents of this important book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO.,

INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,
810 Walnut St., Philadelphia, Pa., U. S. A.**Giant Powder Fuse Cap Fastener.**

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, 82 each, or the entire instrument finished in gold plate, \$8. N. W. MOODY, Fresno, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 30, 1891

General trade continues dull, but not more so than usually obtains at this season of the year. The grain crops are turning out larger than many well-informed parties had estimated. They are not only larger, but of excellent quality. At the East, all advices continue favorable, with crops large and prices good. Throughout the United States, encouraging advices are at hand. The only seeming drawback is continued discussion of, and a demand by, a large and growing organization for a change in our financial system.

QUICKSILVER—Receipts the past week aggregate 161 flasks, and shipments by sea 30 flasks. The market does not present any new features worthy of particular mention.

MEXICAN DOLLARS—Heavy receipts and an offish demand cause a slow market to obtain at from 78 to 79 cents.

SILVER—The market is strong at around \$1 per ounce. At the East, the prevailing opinion is that there will be a gradual strengthening, with fluctuations, until prices reach the highest point touched in 1870. Some even go a step further and claim that par will be reached by the time Congress meets. While it is possible for \$1.29 3/4 to be realized by December, yet it is quite certain that much better prices will obtain than are now current. The market in Europe, while somewhat unsettled, still has symptoms of steadying and advancing. It is not at all unlikely but quite a short interest exists, which, if correct, may aid very materially in sending prices to much higher figures. The India demand ought to set in soon.

LIME—Receipts the past week aggregate 3,085 bbls. The shipments by sea are fair, while the home demand is quite active.

ANTIMONY—The market in sympathy with the East is weak, with concessions obtainable.

TIN—The demand is slow, with concessions obtainable. Receipts overlaid the past week, aggregate 450 boxes plate. Late English cables report pig lower, but plate firmer under a slight increased call. The works have not started up.

COPPER—The market is still settling. New York advices report increased, selling offers which unfavorably affect the market. *Iron Age*, London cable, July 23rd, reports: "Copper prices receded about 1/2 during the week, under the influence of free offering of forwarders in quite large blocks and realizations by small holders. The recent selling, it is believed, has created a considerable short interest that may be an important factor later on. The visible supply has increased somewhat. Chili charters first half of the month were 500 tons. Sales of furnace material are lot. The latest included 800 tons Montana Matte at 105¢.

IRON—Imports of pig the past week aggregate as follows: Liverpool 500 tons, New Castle (Eng.) 500, Oregon 75. Total 1,075 tons. Our market is unchanged. The consumption is said to be fully 20 per cent more than it was at the like time in 1890. English advices report stronger outward freights which inspires more confidence with holders here.

COKE—Imports the past week aggregated 4751 tons from England. The market is being shaded on quotations.

COAL—Imports the past week aggregate as follows: Overland, 62 tons; Coos Bay, 150; Comox, 4300; Tacoma, 2200; Cardiff, 1133; Newcastle (Eng.), 1000; Newcastle (N. S. W.), 2034; Baltimore, 2004; Greenock, 3775; Seattle, 756; Nanaimo, 4586; Departure Bay, 5845; total, 29,845 tons. The spot market is strong with an increasing demand for all grades. The consumption is claimed to be the largest on record. Consumers still maintain the belief that with a growing output of the, Puget Sound mines, the market will not advance. This opinion is further strengthened by the large tonnage with foreign on the way and to land.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

DAVIS PILE-CASING CO., July 13. Object, to purchase and sell devices for protecting piles from the terebdo. Directors—Edward Davis, N. A. Jones, J. H. Currie, J. C. Nealon, J. J. Schriener D. McNea and E. M. Morgan.

BERKELEY AND LORIN WATER & LIGHT CO., July 13. Capital Stock, \$250,000. Directors—W. L. Sheldon, W. F. Martin, J. A. Mallin, J. Purcell and C. W. Elting.

ESTRELLA DE ORO DRYING & PACKING CO., July 13. Directors—S. P. Burdick, A. W. Burdick, A. M. Sutton, J. M. Merrill and Bernha S. Shafter. **PACIFIC COAST NATURAL GAS, OIL & MINERAL CO.**, July 15. Capital Stock, \$100,000. Directors—E. E. Perley, E. J. Beane, Geo. T. Dunlap, N. K. Spect and J. W. Dunlap.

MATSON FRUME CO., July 15. Object, the manufacture and publication of educational appliances and books. Capital Stock, \$500,000. Directors—Fannie L. Matson, Mary E. Arnold, Geo. H. Fuller, Wm. R. Dangerfield, W. F. Gibson, Emma J. Arnold and Henry E. Pastor.

SUNNYSIDE LAND CO., July 15. Capital Stock, \$1,000,000. Directors—B. Joost, P. Rohrbacher, F. F. Moulton, W. W. Connor and Rudolf Mohr.

Eastern Metal Markets.

By Telegraph.

New York, July 30.—The following are the closing prices the past week:

	Silver in Silver	Copper.	Lead.	Tin.

Copper continues to recede under heavy supplies. Lead is fairly firm, as is tin. Quicksilver is steadier. Antimony is still shading. Borax is fairly firm.

Mining Share Market.

Comstock mining shares the past week exhibited more life than for several weeks, and the way in which some of the shares jumped up and fell back threw the chipping fraternity into a chaotic state of mind that must have pleased the master General in command of manipulating the stocks. Some of the moves that were looked for did not materialize, while others, not looked for, came and vanished in a day's time. Such rapid ups and downs bring prominently forward cappers and "camp followers" who are filling the air with rumors. They generally give out to one set of outside operators a bull move, to another a coming break, and to still another they say, "Let them alone, for it is not time to enter the market." The point that proves correct and out of which the operator makes a profit, a "div" is expected, but they forget to look after the losing point. There is no denying but the market has an exceedingly healthy tone, but how the pool's managing manipulator will work it from day to day, or even week to week, is beyond the writer's knowledge, but what we do claim to know is that the conditions never so well favored a bull campaign as they do at the present time.

Briefly stated, they are as follows: Mining shares are closer concentrated than for years. The money market is not only easy but promising to be unusually easy before "the snow flies," under large crops, good prices and farmers selling, which always stimulate every other industry, and last, but by no means the least, a certainty that the next Congress will pass a free coinage bill.

Besides the above, the fact must not be lost sight of that the mines from Utah to Caledonia, or, in other words, from one end to the other, were never before in as good condition for exploiting and developing work. There are drifts, crosscuts, shafts, etc., from one end to the other, and unlike in former years, the managers of the different groups of mines appear to be working in harmony.

The Chollar Mining Co.'s returns for June report are as follows: "Average assay of the ore per ton, \$20.69; 65 per cent of assay, \$13.44; gross average per ton, \$13.74; net average per ton, \$5.74; per cent worked, 65." Where does the one-third go? Is it not about time that the reported controller of this middle group of mines look after this big leak? But then perhaps the powers have it so arranged that the leakage runs into their already overflowing bank account.

The share market opened strong this (Thursday) morning with Potosi and Bullion in the end. After Call, Gould and Curry led, then eased a little, when Ophir came to the front. The public is looking for a weaker market next week, this feeling is emphasized by confirmed reports that the Morgan mill will stop running on Con, Virginia ore and run the tailings. It is currently believed that the latter are very rich, being confiscated through the milling process peculiar to the Comstock, of course Con. (should be confiscated) Virginia shareholders do not share in the profits from the tailings, or at least, so says current report.

The *Territorial Enterprise* in quoting the PRESS of July 25th, is mistaken about our not giving it credit for the Sierra Nevada article, for the quotation marks show that we did. Our assertion that ore was found in the west working of the North End mines will be verified when the time comes to start the Union Con. pump. At that time we will have something more to say about the west workings, of the North End mines, and copies of surveys will be forthcoming to verify our statement in last week's paper and that actual work was done in the mines, and which was paid for by assessing stockholders. Covering up ore holes while stockholders were being "froze out" of their stock is not a very modern accomplishment of Comstock managers. It is at least 12 years old. What has the *Enterprise* to say about the west workings in Savage, Hale and Norcross and Chollar? The E-street tunnel connects with the Sinaloa shaft and we contend that the west ledge is fully exposed in those mines from the 1400-foot level up to the surface. We now urge upon Mr. Levy & Co. to open out the west workings of those Middle mines. Those supposed secret workings are common property. Con. Virginia will probably declare a dividend about the 10th of August.

San Francisco Metal Market.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS, Varying from the fraction of 1 up to 15 and 20-horse power, unequalled for all light-running machinery.

Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY, UNEQUALED IN EFFICIENCY, UPWARD OF 3000 NOW IN USE.

Will do more than twice the work of any other with the same cost in wear.

Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented Oct. 8, 1889, and Dec., 1890.

ANGELS, CALAVERAS COUNTY, Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Good Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON CARREARD,
Supt. Good Cliff Mine.

HELENA & IDAHO GOLD MINING CO., SUPERINTENDENT'S OFFICE, GIBSONVILLE IDAHO, Oct. 6, 1890.

MR. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting, and the other one is all ready to start. They were so easy to set up and run that I forgot all about the "letter of instructions" until they were set up and running, and you recalled to my mind your letter and instructions. Yours truly,
MYRON K. RODGERS, Supt.

ANGELS, CALAVERAS CO., Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours,
T. M. LANE, Supt. Madison Mine.

ANGELS CAMP, July 25, 1891.
MR. JAMES TULLOCK—Dear Sir: We are working sulphurets from mines in Calaveras and Tuolumne Co's. We find the sulphurets saved on your machines cleaner than those saved on any other. Yours truly,
THOS. N. SMITH, Supt. Utica Chlorination Works.

Price, \$450.

Pulverizing Ore.

The Dodge pulverizer with all the latest improvements consists of a hexagonal drum or barrel, as shown in the cuts, into which the ore, after passing through the rock breaker, is fed by an ore feeder through the feed hopper. The barrel is lined with forged steel bars which are held in place by wedges, secured by bolts and rubber springs to prevent their working loose. These bars are so placed that there is a space of three-eighths inch between each and form a grating through which the ore passes to the screens, which are on each side of the hexagon and afford a ready means of discharge for any ore that is crushed fine enough to pass through them, while the coarser particles are returned to the interior of the barrel for further crushing.

The pulverizer being hexagonal in shape, the ore does not slide in mass, as is the case in cylindrical pulverizers, but is raised to a certain point and dropped by each side of the hexagon as the mill rotates, thus insuring more effective crushing and less wear on the bars. Pieces of hard quartz or stone are used for crushing. Steel grinders, weighing about ten pounds each, may be used for this purpose; or, preferably, both steel and quartz are employed.

The mill is arranged for either dry or wet crushing, and gives equal satisfaction under either arrangement. When arranged as a dry crushing mill, the water pipes and apron shown in the cut are not furnished and the bottom frame is hoisted up, forming a bin into which the crushed ore is discharged and from which it can be removed by means of an elevator or other device. The jar, caused by the falling of the ore and steel grinders on the bars as the mill rotates, tends to clear the screens and prevents "choking," which very materially adds to the capacity of the mill.

On account of the immediate discharge of

the ore through the screen, as soon as it is crushed fine enough to pass the mesh used, the percentage of slimes is reduced to a minimum, and the loss in the tailings correspondingly decreased as compared with forms of mills in which the discharge is accomplished by a "swash." One of the engravings shows the mill arranged for wet-crushing, and the other is a sectional view showing the interior parts. Those who have used this mill speak highly of its efficiency. The Parke & Looy Co., 21 and 23 Fremont St., in this city, are the manufacturers.

SECTIONAL VIEW OF THE DODGE PULVERIZER.

Quarrying Gold Ore.

The Treadwell mine, Douglas Island, Alaska, is worked differently from the ordinary gold-ore veins of this State. The vein is so wide that it is worked somewhat like a great quarry. The ore is of low grade, but there are immense quantities of it, so that the mine has paid very well. The men drill into the sides of the deposit, a blast is put in and large quantities of ore are dislodged.

The cut given herewith (for which we are indebted to the *Overland Monthly*) shows several

gangs of men at work drilling. The mine has the largest quartz-milling plant in the world. The mill has 240 stamps of 850 pounds each, 6 rock-breakers and 96 concentrators. It handles 600 tons of ore per day, using water-power or steam according to season. The mill was built by the Riedon Iron Works of this city.

THE Dugway excitement, urged so forcibly by the Salt Lake papers a few weeks ago, has dwindled to such a point that the line of stage running there from Stockton has been discontinued entirely.

DODGE PULVERIZER ARRANGED FOR WET CRUSHING.

THE TREADWELL MINE, ALASKA.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Tuolumne County Mines.

EDITORS PRESS:—During the past week I visited the mines of Tuolumne county that are situated in the vicinity of Columbia, Sonora and Soulsbyville.

The Old Tuolumne, R. C. Davis Supt., is best known as the Davis mine, and is situated about three miles northeast of Columbia on the south bank of the south fork of the Stanislaus river. At this time a tunnel is being driven which is now in over 600 feet, with from 200 to 400 feet more to go to cut the vein, which will here be tapped 300 feet deep. In the old workings the vein has been six feet in width of quartz averaging \$10 a ton with 2½ per cent of sulphurets. The mine has a five-stamp mill which will be moved down to the mouth of the present tunnel.

The Golden Era Mine.

A. F. Lucas Supt., was given a somewhat detailed description in a late number of the PRESS. In consequence, it is not necessary to state more than that the mill is running nicely, the drifts being driven ahead and the mine quietly but steadily being developed. As the superintendent's motto is "First the mine, then the mill," the Golden Era will be made to reveal all that lies hidden within her walls before an extensive and expensive plant will be erected. Every condition is favorable; all that is wanted is time for development.

The Keltz

Is being developed by the Leachman Prospecting and Developing Co. The results have been very satisfactory and have more than verified the report made by the writer on a previous trip. Your readers may remember that the property is on the south fork of the Stanislaus river, above the Golden Era and opposite the Riverside.

The Riverside

Is almost opposite the Keltz. The mill is at the river's edge. At this time the property is being worked by tributaries.

Above these mines on Rose creek are a number of mines which, on account of their almost inaccessible position, are but little known. Among these is the Last Chance, L. C. Tibbitts Supt. This mine is being developed by the Eagle Mining Co. The property is situated on Rose creek, between the north and south forks of the Stanislaus river. The company formerly operated the Eagle mine in the same vicinity, but have closed it down, and when the Last Chance is sufficiently developed will move the mill on to it. The vein thus far shows from one to three feet of quartz that runs from \$5 to \$8 a ton.

The Starr Mine.

This property is in the same section as the Last Chance. In the earlier history of the mine, large sums of money were taken from the spurs or feeders. The main vein is practically untouched. For years past the mine has received but little more than assessment work. Now, however, Mr. R. Lee McPherson has taken hold, and under lease will endeavor to develop the property. There is every reason to believe that in depth the numerous rich feeders that run to and into the main vein will make it rich and the mine a very valuable property. Mr. R. Lee McPherson has lately uncovered an old river channel on the Wine Spring ranch, near Columbia. This channel is between and below the old Texe and Nigger Gulch diggings. It was lost by the early miners and remained hidden until Mr. McPherson discovered it.

The channel is about 80 feet wide, with an average of four feet of gravel, which is covered by about 20 feet of soil. Thus far the mine has averaged \$25 a day, working two men. A pipe has now been put on, and better results will be obtained. The mine has an abundance of free water and several thousand feet fall for dump. In consequence, Mr. McPherson has every reason to know that he has "struck a good thing."

The Bellevue.

J. W. C. Maxwell is resident owner of this mine. It was formerly known as "the Hyde." The mine is opened by incline shaft to a depth of 350 feet, with drifts run 225 feet. The vein in the present workings averages 16 feet in width of milling rock. The returns have proved very satisfactory to the owners. The mill is of ten stamps, steam power, and is perhaps the best ten-stamp mill in the State. It was formerly on the Josephine mine, and is not alone complete, but the entire machinery is of the very best.

Soulsbyville.

This old and justly famous camp is quiet at this time, but there is every reason to believe that she will soon return to her old time prosperity. The old Soulsby has yielded an immense amount of the yellow metal in the past, and as only a very small fraction of her territory has ever been explored, there is every reason to believe that she holds a still greater store of wealth for those that will but develop the virgin ground. At the Platt & Gilson, the superintendent, Mr. Trittebach, is keeping up the developing of the mine and at this time is sinking.

The Black Oak is dropping 10 stamps on ore that is said to be high in grade.

Sonora.

At the Golden Gate, E. C. Loftus, the superintendent, has the shaft down 270 feet, and intends continuing down an additional 200 feet. When this is done and the drifts run, additional stamps will be placed in the mill, but the reserves will be created first, though the mine has sufficient ore in sight at this time to keep the present mill running for two years. Since my last visit additional water for power has been brought in, and a pressure of 300 feet obtained. Air compressors, power drills and a new hoist have been put in. Mr. Loftus is getting the mine into the best shape possible and the most satisfactory part of it, is the fact that the mine is paying for all the improvements. Through Mr. Loftus the mine has been made the leading property of the county, and in consequence of the money expended by the company, the people of the county should show their appreciation by kindly encouragement, that they may not only be induced to continue, but that other capitalists may also invest. There is no reason why the same encouragement should not be extended to mining that is bestowed on all other business enterprises. Almost any town will give a free site, a right of way, subscribe for stock, guarantee a liberal house and exempt from taxation any manufactory that will locate in their midst. Did anyone ever hear of any mining companies being given these inducements? On the contrary, every one that can, "goes for" a mining company in all sections alike.

The hydraulic miners have the apathy, if not secret hostility of the people in their own communities to thank for their defeat. But, "to return to our mutton." Outside of the Golden Gate, there is but little doing at this time. The San Giuseppe is closed pending litigation. The mine is so good that the old owners propose to contest their right to it, and in the meanwhile the purchasers and superintendent, Mr. W. G. Whorf must wait.

The Bonanza.

D. K. Oliver, the superintendent, says they are "not in it." In the Bonanza the gold is in pockets, which when the hove get "in it" turns out the yellow stuff by the hundred thousand. At present Mr. Oliver is taking down some old backs in the Bonanza and sinking from the end of the tunnel, on the extension, (The Last Chance).

The boys have done more than well on their lease; have all grown rich in fact, but the writer wishes them and all the mines of "Old Tuolumne" the best of luck in return for their uniform kindness and courtesy to

E. H. SCHAEFFLE.

MINERAL WEALTH OF THE SALTON SEA.—The Yuma Times believes thoroughly in the assertions of valuable mineral discoveries to be made through the exploration of the overflowed desert, now in progress, and says: A large part of the southern portion of the Colorado desert is still a country of mystery, and the Salton lake will result in one good thing at least, and that is, the mystery will be unveiled and explained away. The mud and lava volcanoes, hot and cold springs, bottomless pits and yawning chasms, the hundreds of acres of quicksands and volcanic ashes, which are known to exist, will most likely prove of but trifling importance by comparison with the discoveries which are likely to be made. During the year 1879, Cocopah Indians brought into Lerdo to George E. Batman specimens of rich cinnabar rock, and also some of the ore in the form of a powder, which they said existed in the country adjacent to the sulphur mine. An effort was made to find the place, but it proved unsuccessful, nor has it been discovered yet. The Indians, with all the superstition of their race, refused to act as guides, and in an off-hand way directed where the mine or deposit lay. Large nuggets of gold have been brought by Indians at intervals from the desert region, but the placers have never been found. Even if the parties now out should prove unsuccessful in their efforts, others will be organized; the history of both the woe and wealth of California's Colorado desert will be published to the world, and with the data properly arranged, will make very interesting and instructive reading.

SPENCEVILLE PAINT.—The enlarged mineral paint works being put up at the Spenceville copper mine, by Messrs. Peitzsch & Woehler, will be of sufficient capacity to supply the demand for the whole Pacific Coast, and the paint itself, as shown by analysis, is superior to any that has been placed on the market. By a chemical process, there are two shades of color given to the paint—one bright red and the other red-brown—which fit it for very general use, and of great utility in adding to the lasting quality of the wooden structures upon which it is used. The company has apparently an inexhaustible supply of the copper ore from which this mineral paint is made.—*Grass Valley Union*.

SEAMLESS GOLD TUBING.—A new process has been invented for the production of seamless gold-plated tubes. A longitudinally split tube of gold stock is first made, and, after covering it with a fluxing material, the gold tube is slipped upon the base-metal tube. The opening of the tubes must not be coincident with each other. The compound tube is now subjected to heat sufficient to fuse the gold upon the base metal, and at the same time to cause the melted gold to flow into the openings of the tubes, after which the compound tube is drawn through a draw-plate.

An Increasing Demand for Graphite.

The successful experiments which have been made in the use of graphite as a lining for converting vessels, it being a material specially adapted to withstand the outting action of the acid slag, has brought about a scarcity in the supply of old crucibles, and bids fair to open a new market for hurned graphite. But little over a year ago, says the *American Manufacturer*, old crucibles could be had, say, at a dollar per ton, their main use being as filling, or for a carload of cinders, one could obtain a carload of this, then waste material. One concern in Pittsburgh, last year, had the contract for all the waste crucibles from three of the leading crucible steel works in the city for \$1 per ton. But with the adoption of this material for furnace and converter linings, and the consequent increased demand for it, the price advanced to \$3 per ton, and has since gone even to \$10 per ton, and is hardly to be had in any quantity at that. It would seem that with the present and increasing demand for this material, and the source of present supply, which cannot be expected to increase sufficiently to keep pace with it, that calcined graphite suitable for the uses named must soon be put on the market. The supply of raw material is abundant enough, but it is the calcined, pulverized form that steel-makers want.

In this connection the following concerning the source of supply for the world and its cost may be of interest. The present supply for use in making crucibles for steel-making, comes from the island of Ceylon, in the south of Asia. Elaborate experiments have been made with the plumbago mined in the United States, in the hope of making crucibles for this purpose therefrom, but so far, with but indifferent success, or, at the most, with less success than with the imported article. Further, on account of the cheapness of labor in Ceylon, the work of mining and assorting being done almost entirely by women and children, whose wages do not exceed four cents per day, the imported article is cheaper than the home product.

Within the last year the price of plumbago delivered in New York has advanced nearly 60 per cent, due primarily to two causes—the quantity mined has fallen off, and the demand, especially outside the United States, has increased. The total amount of plumbago exported from Ceylon for the year ending June 1, 1890, was 161,874 cwt. For the year ending June 1, 1891, it was 148,043 cwt., a falling off of over 8 per cent. At one time three-fourths of the entire product of the island came to the United States, but at present this country does not receive one-half, and the proportion that it does receive is on the decrease. In the year ending June 1, 1890, 68,726 cwt., of Ceylon graphite came to America, and in the year ending June 1, 1891, only 35,936 cwt.

Germany is becoming a large factor in the trade in the matter of consumption, its increased use by the Krupp works being responsible for this. The imports of Germany for the year ending June 1, 1889, amounted to only 3094 cwt. In 1890 it was 14,215 cwt., and in 1891 about 11,000. The falling off noted from 1890 to 1891 was about proportionate to that in the output, and not due to any lack of demand on the part of that country. During the fiscal years of 1890 and 1891 the imports of graphite in England amounted to 61,949 cwt., and 57,906 cwt., respectively.

The price of plumbago varies according to its quality. It is divided into four grades, viz., large lump, ordinary lump, chip and dust. The present ruling figures are as follows: Lump (ordinary), \$4.50 to \$5 per cwt.; chip, \$3.60 to \$4; dust, \$2.80 to \$3.50. There is a very great scarcity of good plumbago in the market to-day, and no cargoes of any consequence are expected in this country before September 1st.

The quality of plumbago depends as much upon its physical structure as upon its chemical analysis. There is a deposit of this mineral near Reading, Pa., which in analysis is practically identical with the best Ceylon article, yet the best efforts of crucible makers have failed to produce crucibles therefrom equal to those of the Ceylon graphite.

From the foregoing it would appear that if graphite is to be used to any extent for furnace linings some form of it which can be had cheaper than old crucibles, or even the material mixed with clay, calcined and pulverized, is desirable. With the raw material selling, say, at 3 cents per pound, the cost of material of this sort is not likely to be much less than that of new crucibles, for the material would require the same treatment, less the molding into the form of crucibles, which would bring it, say, to 4 cents per pound, or \$50 per ton.

NETADA IRON ORE.—Thirteen miles from the line of the railroad in this county there is a mountain of iron ore containing 98 per cent of pure iron. It can be run into pig iron in any ordinary furnace. Some of it has been smelted at the railroad shops at Sacramento, where it is pronounced to be of the best quality of iron. Without exaggeration, the quantity is so great that the assessment work necessary to hold the number of claims that might be located on this body of ore, under the Congressional mining law, would furnish enough iron, run into railroad T-iron, to construct half a dozen double-track railroads from San Francisco to New York. This ore will pay to ship to any distance that the

pig iron will bear transportation. If the S. P. Co. would build a railroad 13 miles to connect with the main line and put on sufficient cars, it can furnish all the iron furnaces in the United States, with all the iron they can consume at the mere cost of transportation, and 25 cents per ton to mine and load it on the cars. The gold in the ore will pay all expenses of mining and transportation across the continent if it be desirable to extract the gold. The above is no fancy sketch, but potent facts to any one who will investigate the matter.—*Winnemucca Silver State*.

Will Erect a Smelter.

The American Mining Company, owners of several of the most prominent mines at the Seven Devils, of which company Messrs. Kleinschmidt, Houser and other capitalists of Montana are stockholders, are making preparations for the erection of a large smelting plant at Helena, the new town of the Seven Devils, the works to be in operation early the coming fall.

The present visit of Mr. John C. Rogers, superintendent of the company to Butte, is for the purpose of perfecting all plans, and he will then go East to purchase the necessary machinery. It is expected that the machinery for the smelting plant will arrive in Baker City in the near future for transportation to the mines by team via the Baker City Seven Devils road.

Mr. Mose Fuohs of this city has received advices that from 15 to 20 teams have been engaged by the American Mining Company to transport this machinery.

There is now no further speculation regarding the best and most direct route to the mines. The controversy is settled. Baker City, by her energy and business foresight, has laid all other competing points in the shade, and to-day has no rival for the trade of Idaho's great copper regions. All the Idaho towns realize this fact, and have nothing further to say. Baker City has distanced all rivals, and can justly claim the only direct and accessible route to the mines, and in the no very distant future will reap the benefit of her enterprise.—*Bedrock (Oregon) Democrat*.

THE GEOLOGICAL SURVEY.—The *Tidings* made note, a few weeks ago, of the presence of a corps of surveyors of the United States Geological Survey in this city. The first party confined its work to triangulation and elevation, establishing a base line on Alta Hill. A second corps is now at work platting, under the direction of Mr. Douglass of the Survey. Shortly, a third corps will arrive to pay especial attention to the mining claims of the district, and lastly a corps under the direction of Mr. Becker, an eminent geologist, will arrive to ascertain purely geological data. A survey such as this was made of the Comstock some years ago under the direction of Mr. Becker, and has proved to be of great value. We learn, however, that the survey outlined to be made here covers an area of only from 1½ to 2 miles square, excluding the rich Randolph Flat and Deadman's Flat mineral belts, both gravel and quartz. If possible, this oversight, if such it may be, should be rectified, as the belts indicated comprise a portion of the Grass Valley mining district, and some of the claims therein are yielding profitably and are full of promise. It is apparent that, with the engineers in the field, the additional expense will be trifling, and it is likewise obvious that a complete and correct survey will be of more value to the district and the Government than a partial survey. It is to be hoped that this matter will be brought to the attention of the management at headquarters and orders be issued authorizing the extension of the lines and the taking in of the mineral belts designated. County Surveyor Uren has much data that will be found of value by the gentlemen making the survey.—*Grass Valley Tidings*.

A PREHISTORIC TUSK.—At the Starling hydraulic mine in Jackson county, a tusk of mastodon was washed out a few days since from under a depth of 50 feet of gravel. The tusk was four inches in diameter and was porous and crumbling. Other bones of the same prehistoric animal have been found in this mine at different depths. Just how 50 feet of gold-bearing gravel came to be deposited atop of this tusk is a question for the geologist to decide. It may be that the gravel was washed there by some prehistoric hydraulic miner, who took out all the big nuggets of gold and left only the fine scales for this day and generation. The mammoth did not become extinct so long ago as some other animals, for carcasses of a number of the huge beasts have been found in a frozen condition in Siberia, in a very perfect state of preservation, and their bones have been found in Missouri in the same stratum with human bones, and one great hunter and still greater liar has given out that he has seen living specimens of the animal in the wilds of the Olympic range.—*Portland Oregonian*.

A CLOUDBURST in the Toiyahs mountains, above Austin, Nev., did considerable damage to the old mining town, as the water poured through the streets in torrents.

To prevent the evaporation of water in fire-pails, it has been suggested that 15 to 20 drops of oil will form a coating sufficient to obviate the difficulty.

The Precipitation of Metals from Hyposulphite Solutions.

(Continued from last issue.)

[Read by C. A. STRETSKY, of San Francisco, before the American Institute of Mining Engineers.]

3. Economy of Producing Hyposulphites by Oxidation of Sulphide Solutions.

The question is of importance, whether it is cheaper to buy and add sodium hyposulphite to a deteriorated stock solution, or to introduce hyposulphite by allowing the sulphide solution to oxidize, whereby it degenerates in precipitating power, but gains in hyposulphite. This depends upon local prices of chemicals. In most cases it will be cheaper to produce the hyposulphite by oxidation of the sulphide. A calculation under assumed conditions will be of interest. For $\text{Na}_2\text{S}_2\text{O}_3$, we find:

The formation of 100 pounds $\text{Na}_2\text{S}_2\text{O}_3 + 5 \text{ aq.}$ requires:

35.8 lbs. caustic soda of 90% at 5.5 ct. \$1.96
27.2 lbs. sulphur of 95% at 3.5 ct. 0.95

Total cost. \$2.91
100 lbs. $\text{Na}_2\text{S}_2\text{O}_3 + 5 \text{ aq.}$ at 4 ct. 4.00

Leaving a saving of. \$1.09

If this salt is obtained by the oxidation of Na_2S_2 in the mill.

The cost of obtaining calcium hyposulphite from the sulphide solution by oxidation cannot be accurately or even approximately calculated, for reasons already stated. From the fact that CaS_2 must be oxidized in place of Na_2S_2 , and that in the preparation of calcium sulphide relatively more chemicals are consumed, it follows that the cost cannot, in most cases, be materially less, although caustic lime is very much cheaper than caustic soda; and it may be even greater.

To use a calcium sulphide solution so highly oxidized that the stock solution increases in strength and volume, making it necessary to run it to waste, cannot be good economy, because it necessitates an excessive consumption of the precipitant.

Should it be desirable to use an oxidized sodium sulphide solution, containing a large amount of hyposulphite, oxidation is most conveniently and quickly effected by forcing air through a coil of gas pipe, provided with a great number of small holes, and placed at the bottom of the storage tank.

4. Precipitation of Calcium by Sodium Sulphide Solutions.

This subject has never been considered or presented before. I have observed in former paragraphs:

1st. That it is difficult to prepare the lower sodium polysulphides absolutely free from caustic soda.

2d. That if a sodium sulphide solution containing Na_2S is exposed to the atmosphere, $\text{Na}_2\text{S}_2\text{O}_3 + 2\text{NaOH}$ are formed.

3d. That free caustic soda absorbs carbonic acid from the atmosphere and becomes Na_2CO_3 .

In these reactions lies the key to the appearance of the mysterious yellow precipitate which Russell took for CaS . As can readily be seen, if Russell's sulphide is for any length of time exposed to the atmosphere, it must contain more or less Na_2CO_3 . The Na_2CO_3 originally contained in commercial caustic soda—which may vary between three and five per cent—also comes into play. Assuming, for instance, that six pounds caustic soda were consumed (manufactured into sodium sulphide) per ton of ore, containing four per cent Na_2CO_3 , there would come into action 0.24 pounds Na_2CO_3 , precipitating 0.09 pounds $\text{Ca} = 0.22$ pounds CaCO_3 . Assuming that Russell's sulphide had been made of a high-grade caustic soda (with 95 per cent NaOH), having the composition $\text{Na}_2\text{S} + \text{Na}_2\text{S}_2$, and that by long exposure to the air, one-half of the Na_2S became oxidized, but how much Na_2CO_3 would a quantity of Russell's sulphide contain produced from six pounds caustic soda? Exactly 1.28 pounds, precipitating 0.48 pounds $\text{Ca} = 1.20$ pounds CaCO_3 . Adding the sodium carbonate originally present in the caustic soda, the total amount would be 1.52 pounds, precipitating 0.57 pounds $\text{Ca} = 1.42$ pounds CaCO_3 .

A sodium sulphide solution containing Na_2S , if allowed to oxidize, is unprofitable for another reason. Equation No. 2 shows that only one-half of the Na_2S is converted into $\text{Na}_2\text{S}_2\text{O}_3$, the other half becoming NaOH . Thus oxidation of the solution is unsatisfactory in two ways.

If Russell's sulphide is to be used to advantage, it should be preserved in hermetically sealed tanks.

It has been shown in § 3 that sodium hyposulphite is obtained in most cases at less expense by allowing the sodium sulphide solution

*I have received from the Marsac mill some data concerning silver precipitated from wash-water and weak solution, and from the regular lixiviation solution; also, the values of these precipitates in silver and their percentages of lead and copper. According to these figures, the consumption per ton of ore of caustic soda in the manufacture of Russell's sulphide should be much less than it actually is, unless it be assumed that more than one-half the Na_2S in Russell's sulphide is oxidized by contact with air, a supposition with which the figures agree remarkably well. I do not give the details of this calculation, because I do not know whether the values on which it is based represent true averages.

to oxidize then by baying the hypo-salt; hence, it seems timely to abolish Russell's sulphide altogether and substitute in its place Na_2S_2 , or even a higher polysulphide, if Na_2S_2 cannot be obtained free from Na_2S .

All the statements made above are supported by actual experiments. I prepared from chemically pure reagents two sodium sulphide solutions, one with sufficient sulphur to contain $\text{Na}_2\text{S} + \text{Na}_2\text{S}_2$, another to contain Na_2S_2 . As I am fully aware, it is very difficult to prepare such solutions on a very small laboratory scale, free from caustic soda or from higher polysulphides; but this does not influence in the least the principal points at issue.

The following tests were made with the freshly prepared sulphide solutions:

1st. Solutions of calcium chloride and of gypsum in sodium hyposulphite were prepared, of such concentration that caustic soda produced in them a precipitate of calcium hydrate.

To these solutions the sodium sulphides were now added. Each drop of the concentrated reagents produced a slight flocculent precipitate of intensely yellow color, which would disappear again upon stirring. After successive additions of the reagents, the precipitates finally remained, but to effect this much more of the solution containing $\text{Na}_2\text{S} + \text{Na}_2\text{S}_2$ was consumed than of that containing Na_2S_2 . It became at once apparent that only a very small portion of the reagents was engaged in the reaction, the solution assuming an intensely yellow color. Upon adding a sufficient quantity of water the precipitates dissolve again; hence it was not possible to examine them further by filtering and washing with water. This was done, however, with alcohol, in which sodium polysulphides are soluble and calcium hydrate is not. After repeated washing with alcohol, the precipitates became white and proved to be calcium hydrate.

Now 50 c. c. of each sulphide solution was put into a seven-pound acid bottle and shaken for three hours, air and carbonic acid being blown from the lungs into the bottles every few minutes. In the beginning, the solution remained perfectly clear; finally a small amount of sulphur separated, indicating the presence of higher polysulphides than Na_2S_2 .

The oxidized sulphides were now tested with calcium solutions as before. Yellow precipitates appeared at once; but, with equal quantities of the reagents, the precipitate from the Na_2S_2 solution was quite small compared with that obtained by the $\text{Na}_2\text{S} + \text{Na}_2\text{S}_2$ solution. These precipitates were not flocculent, settled quickly and did not dissolve upon addition of water. After washing they became perfectly white, and proved to be CaCO_3 . Q. E. D.

It is claimed that the precipitate of calcium can be avoided if precipitation of silver, copper and lead is not done too closely. I am of an entirely different opinion. If the precipitate were actually an insoluble calcium sulphide, yes; but since it is CaCO_3 , its precipitation must commence at once. The precipitate becomes apparent only after the metals have been completely precipitated and if calcium still remains in solution. The precipitate appears yellow, because it holds mechanically sodium sulphide. Only prolonged washing makes it white. As will be seen from the example quoted previously, much more calcium may be in a lixiviation solution per ton of ore than can be precipitated even by a well-oxidized Russell's sulphide prepared from six pounds of caustic soda.

It remains to be seen how much sulphur is actually needed in practice to prepare a sodium sulphide free from Na_2S . How to test such a solution for ascertaining this has been shown above.

5. Regeneration of Sodium Hyposulphite from Tetrathionate.

In preparing Russell's extra solution, one pound of sodium hyposulphite is changed to tetrathionate for each pound of copper sulphate consumed. The formation of tetrathionate is further increased by the atmospheric decomposition of extra solution, so that, finally, the solution must hold a considerable amount of sodium tetrathionate, which salt is not a solvent for silver compounds. Fortunately, a very simple reaction converts the tetrathionate again into hyposulphite:

This reaction takes place in precipitating the solution.

So long as metals remain unprecipitated, it is doubtful whether this regeneration can take place or not. Close precipitation and over-precipitation, however, would give the reaction free scope; hence it will be judicious to precipitate closely, and to over-precipitate occasionally, the solution in a number of precipitating tanks. The excess of sodium sulphide is then neutralized by running some fresh silver solution into the precipitating tank. That all this is not merely theoretical speculation is proved by statistics from the Yedras mill, Mexico. With a consumption of 9.6 pounds copper sulphate per ton of ore for making extra solution, the loss in solution hyposulphite, by close precipitation, was only 1.4 pounds per ton of ore treated. When the consumption of copper sulphate was reduced to 7.7 pounds, the loss in hyposulphite fell to 0.74 pounds. In this case over-precipitation was not practiced; if it had been done, the loss in hyposulphite would have been reduced still further. That it is profitable to regenerate hyposulphite from tetrathionate the following calculation will show, based upon the quality and prices of chemicals assumed in § 3.

For the production of 100 pounds sodium

hyposulphite, a quantity of Na_2S_2 would be needed requiring:

21.5 pounds caustic soda \$1.18
16.3 pounds sulphur 0.57

Total cost. \$1.75
100 pounds $\text{Na}_2\text{S}_2\text{O}_3 + 5 \text{ aq.}$ \$4.00

Net saving. \$2.25

In this estimate the hyposulphite contained in and added by freshly prepared Na_2S_2 is included. In regenerating hyposulphite from tetrathionate, free sulphur is added to the precipitated sulphide, as follows:

For 100 parts hyposulphite regenerated, there are added:

When Na_2S_2 is used 6.45 parts of sulphur
" Na_2S_2 " 12.90 " "
" CaS_2 " 32.25 " "

In these figures the hyposulphite added by and contained in the sulphides is not included.

(To be Continued)

The American Flag.

An order has been issued by the War Department that on and after July 4th the National flag will consist of 44 stars arranged in six rows (as shown in the accompanying sketch)

on a blue ground. So if you are purchasing a new flag this year, says the Chicago Tribune, be sure the storekeeper does not unload upon you one very much out of date, which only represents a part of this good and rapidly growing Republic. Demand the latest and see that you get it.

Every star in the new flag represents a phase of progress in the Nation's history. On June 14, 1777—114 years ago—the American Congress passed a resolution that "the flag of the 13 United States be 13 stripes, alternate red and white; that the Union be 13 stars, white in a blue field, representing a new constellation." In 1795 two stripes were added to commemorate the entry of Vermont and Kentucky as States into the Union, and two new stars were also placed with those in the Union. The stars were then arranged in three parallel rows.

No further change was made until 1818, although in the meantime Tennessee (1796), Ohio (1802), Louisiana (1812), Indiana (1816) and Mississippi (1817) had been admitted. On April 4, 1818, a bill was signed by President Monroe reducing the number of stripes to 13 and adopting new stars for the States admitted since 1795.

The number of stars has been increased as follows on the Fourth of July of the following years:

In 1819, one star for Illinois; 1820, two stars, one for Alabama and one for Maine; 1822, one star for Missouri; 1836, one star for Arkansas; 1837, one star for Michigan; 1845, one star for Florida; 1846, one star for Texas; 1847, one star for Iowa; 1848, one star for Wisconsin; 1851, one star for California; 1858, one star for Minnesota; 1859, one star for Oregon; 1861, one star for Kansas; 1863, one star for West Virginia; 1865, one star for Nevada; 1877, one star for Nebraska; 1877, one star for Colorado; 1890, five stars for North Dakota, South Dakota, Montana, Washington and Idaho; 1891, one star for Wyoming, making 44 in all.

BED OF PIPE CLAY.—A. Larabee and Eddie Owens are at work prospecting an island in the river about two miles below Goodyear Bar. They are after a bed of gravel which underlies a body of pipe-clay. The early miners worked down to the clay, and thinking it was a kind of bedrock went no farther. An unworked portion of the river bed is supposed to underlie the pipe-clay. The question is, how came this large body of pipe-clay in the bed of the river? Where did it come from? Did it come from some plover channel which crossed the country at an altitude of 2000 feet above its present resting place? If so, what preserved it for the vast lapse of time which was required to erode the canyon of the Yuba to its present depth?—*Nevada Transcript.*

THE Calumet and Hecla mines, Michigan, will shortly have an electrical mining plant installed. The plant is expected to be a model one, and will do much to hasten the application of electricity in mining work elsewhere.

A PHILADELPHIA MAN has been blood-poisoned, probably fatally, by the bite of a mosquito.

New Well Boring Hydraulic Pump.

LANCASTER, LOS ANGELES Co., July 22.—The first artesian well ever sunk in this valley (Antelope) and probably in California, without casing or pipe of any description was successfully commenced and finished to-day by means of a hydraulic pump. This morning at 8 o'clock, three men started to sink an artesian well at Mr. B. Hanneh's ranch, some six miles west from this place, and by 6 o'clock they had struck a fine flow of water at a depth of 260 feet. The whole valley is enthusiastic over the occurrence, since heretofore to sink such a well would have taken two months at a cost of \$2,500 per foot, while under this system wells can be sunk at \$1 per foot. The parties putting down the well are from Alamosa, Colo., where they have sunk numerous wells under the same system. Failure was prophesied for them on every side throughout this section, but nothing daunted they went to work with the above result. They had been promised contracts for two or three dozen artesian wells should they be successful, and but little doubt now exists that that number will be added to the dozen or so already sunk here under the old system. Should their future efforts be as successful as that of to-day, the much-vexed question of irrigating this vast country will be practically solved.

LANCASTER, LOS ANGELES Co., July 23.—The new method of sinking artesian wells without casing by the hydraulic pump continues a success. This morning, one and a half miles west of here, a well was sunk 150 feet inside of five hours, and a flow of five miners' inches obtained. Letters of inquiry are pouring in from all parts of the State, and it is safe to predict that before the end of the year every quarter section for some six miles around will have its own flowing well and that Government land will be a thing of the past in this section, as it has been solely a lack of water that has kept the valley back, the land being admirably adapted for deciduous fruits and alfalfa.

DRY KILNS are beginning to come into more general use in this section. When local building was at its height lumber could be sold readily as it came from the saw. Now, however, competition is very strong and he who can sell the best lumber for the least money, generally captures the trade. The business of manufacturing lumber is undergoing a radical change. Dry kilns are being rapidly placed in all the old plants of importance, while they are considered as indispensable adjuncts to the new concerns. Modern machinery is being adopted. Manufacturers are discarding the methods employed of old and "catching on" to those of other lumber regions. The hand saw, which up to a very recent date was believed to be absolutely worthless for use on Washington fir, is being used with great success in a number of new mills on the Sound, and the quality of lumber so far as appearance is concerned, is far superior to the old obsolescent kilns which are employed altogether in one or two of the old fashioned mills in Tacoma and elsewhere. One concern in particular, which never can be induced to adopt any improved machinery, turns out lumber that most manufacturers of this section would be ashamed to put aboard of a vessel. And yet this company boasts a capacity of nearly half a million feet daily and ships large cargoes to California and foreign ports. It can hardly hope, however, to compete in any new market and even its old time prestige is slipping away from it since its competitors have begun to experiment on the timber of this region with modern machinery.—*Puget Sound Lumberman.*

COSMIC DUST.—The kryokonite collected by Nordenskjöld in Greenland in 1883 has been investigated by Wulff, and found to consist mainly of feldspar, quartz, mica and boron-blende. Garnet, zircon, magnetite, augite, sillimanite, together with a nitrogenous organic substance, are also present in it. The larger part of the dust is thought to be a sediment from the air, and to have been obtained by it from a region of crystalline schists. But the most interesting constituents of the dust, little oblongs of opaque, isotropic, transparent and double-refractive material, are considered to be of cosmic origin, owing to their similarity to the oblongs obtained in deep-sea soundings.

A FLEXIBLE SANDSTONE.—A greater curiosity than spongy sand is found in the flexible sandstone of North Carolina. The quarries are in the mountains of the southwestern corner of the State, and the stone is taken out more as a curiosity than for any other purpose, though it is sometimes employed in building. When cut in a thin piece, say the size and shape of a common whetstone, you can bend it into a considerable arc without its breaking, and it will resume its former straightness on the pressure being removed. Of course if you bend it too far it will break, but the fact that it will bend at all is most remarkable.—*St. Louis Globe Democrat.*

NEW ANESTHETIC.—Mr. Labord, a French scientist, has announced his discovery of a new anesthetic, which he calls crystallized nareol. It is said to be superior to other anesthetics, inasmuch as no digestive rearrangement follows the sound sleep into which it carries the patient.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

HARDENBURG.—*Ledger*, Aug. 1: The result of the work so far done on this property at Middle Bar is sufficiently encouraging to induce the company to prosecute explorations to a greater depth. The shaft is to be sunk 100 feet deeper at once. The mill will be kept running steadily, if possible, while this work is in progress. The outlook is deemed very favorable for the Hardenburg developing into a steady paying mine.

PLYMOUTH CBN. G. M. Co.—Mr. H. W. Lazelle, secretary of this company, has issued the following financial statement to July 1: Surplus Jan. 1, 1891, \$22,258.93; miscellaneous receipts, \$235.16; gold bullion produced, April—\$5812.68; May—\$3011.96; June, \$4395.91; total, \$37,739.64. Expenses, January—\$2313.68; February, \$2496.39; March, \$2605.76; April, \$3049.84; May, \$3016.22; June, \$3493.50; total, \$16,975.39. Surplus, \$20,764.25. He also says: "Since the last statement further progress in the upraise developed the existence of a valuable body of ore. It gradually widened to six feet, and is of good grade. When work was suspended, the upraise was nearly 200 feet high. With so favorable an outlook, the management felt justified in commencing a new tunnel in order to work the newly discovered rock advantageously. Operations elsewhere were suspended July 1, while a station is being cut out for new tunnel. The new tunnel now being run to ore will take a number of months to finish. Until that time we can run but few stamps, but after completion, the output should be largely increased."

MISCELLANEOUS.—The Amador gold mine remains idle, with no change to report in the situation. Indeed, the general opinion is that it will be tied up for some time yet. The furniture in the dwelling-house was attached recently for about \$500. The English company paid off the debt, which goes to show that they will eventually straighten out all the financial tangles in which the mine is involved. Large quantities of timbers are being delivered at the Kennedy and Zeile mines; about a dozen big teams are engaged in hauling from the mountains. The Kennedy swallows up something like 5000 round timbers per year, and the Zeile a still larger number.

MARBLE AT VOLCANO.—Since the opening of the now famous Carrara marble quarry, near Pine Grove, and the shipment therefrom of a large amount of marble to the San Francisco market, renewed activity has been stimulated in various other parts of the county in the way of prospecting for and developing other quarries; and it already begins to look as though "Little Amador" will soon be prepared to supply all the marble that will be needed in this State for the next century. We made a short visit to Volcano last Saturday, and during our brief stay in the town, we were shown a large number of specimens of fine grained marble of various colors which had just been taken from two new quarries that are being opened in that vicinity, and were kindly permitted to bring a few specimens home with us, which can be seen in our office at any time. One of these quarries is situated almost in the edge of town and is owned by O. Tam, John Rossi and others, and is a very extensive one. The other one is only a short distance from the town and is owned, or headed by Mr. V. Particelli, the well known stone cutter of Jackson. We are informed that both these are very extensive and consequently the supply will be practically unlimited. The only drawback now to the successful working of these quarries is the expense of transportation which we think will be cheapened when the proposed electric railroad shall have been completed, which we hope will be in the near future.

Calaveras.

WOODS.—*Cor. Calaveras Prospect*, Aug. 1: The Wood's mine, at Indian Creek, hounded and operated by Colin Campbell, of San Francisco, is developing into as good a mine as there is in the county if all reports are true. Under its able management new chutes of ore have been found and the mine opened in a systematic manner. The ore taken out averages as formerly when the mine was at its high and highly productive. It is said that there is an abundance of rock, and with the mine properly manipulated it will hold its own position with any. The mill at the Total Wreck, near this place, will be moved to Indian Creek in the near future.

El Dorado.

THE BALTIC DISTRICT.—*Mt. Democrat*, August 1: During the past week the Blue Gorge has been turning out very fine ore, which seems to improve as developments progress. At the Big Bonanza mine, at a depth of 50 feet the vein is 11 feet between walls, the ore being of high grade. At the Baltic mine preparations are being made for active operations. The mine is fairly well opened with shaft and levels. Additional buildings are being erected. The Scironi mine is showing well, with over 100 tons of ore on the dump.

IN THE GOLD HILL DISTRICT the old Barbara mine is attracting attention. In early days an incline shaft was sunk 60 feet deep the ore from which was hauled to Grass Valley for reduction and paid \$15 per ton, the ledge at that point being three feet thick. Several openings were made along the ledge showing it to be from 2½ to 12 feet in thickness. The ore giving fair prospects at every opening. At the Manzanita Queen mine in Diamond Springs district, the Superintendent advertises for bids for the sinking of a shaft 46 feet in the clear, 100 feet deep. Andrew O'Neil has struck good paying gravel in his tunnel at Weaver Hill. A force of men has been at work at the Fort Jim mine in Newtown district. The Dalmatia Co., of Kelsey district, have purchased the old St. Lawrence mine, and have commenced excavations, with a view to putting up works on that mine.

Humboldt.

COAL ON MAPLE CREEK.—*Blue Lake Advocate*: In regard to the coal mines on Maple creek, Mr. G. H. Close speaks nothing but the truth. The writer of this article lived some four years in that vicinity, and had lots of chances of looking at the coal mines; in fact, for over two winters, burnt nothing else but coal, coming around there. The

coal found on Maple creek is a good deal like the coal found along the range of mountains, back of the Yellowstone river, in Montana. Should these mines be opened, it would make Humboldt county, for the writer is of the same opinion, that once the mines are opened, they will be found exhaustless, and will make another shipping industry along with the Redwood. Besides there is a great quantity of oil which would be brought to market, but unless these mines are opened, and the railroad pushed to there, the mines may remain in the same conditions that they have been for the last 40 years that this county has been settled.

Mono.

BODIE CON.—*Miner*, July 31: During the past week east crosscut No. 1, 700-foot level, was extended 12 feet. East crosscut No. 2 from main north drift, same level, was extended 16 feet. East crosscut, 250-foot level, Jupiter shaft, was extended 10 feet. There were employed 10 miners and 1 carman, and jointly with Mono, 1 engineer, 1 blacksmith, 1 carman, 1 watchman, 1 hoiler-maker and 1 foreman.

THE MONO.—During the past week upraise from No. 2 south drift, 700-foot level, was extended 14 feet.

Nevada.

MANZANITA MINE.—*Grass Valley Union*, Aug. 1: The new incline of the Manzanita gravel mine, Nevada City, is down 160 feet. At the depth of 240 feet it is the intention to commence drifting for gravel channel.

THE EAGLE BIRD SOLD.—*Transcript*, Aug. 1: O. Newhouse is in town to-day on his way from the Eagle Bird (Diamond D) mine at Mayhew, Washington township, to S. F. He will not return to this county. Mr. Newhouse verifies the announcement made by the *Transcript* a few weeks ago, to the effect that the mine, which is one of the most valuable and extensive quartz properties in the State, has been sold to a S. F. Co. The mine has yielded about \$250,000 within the last 2½ years. During the preceding two years, when under the Shattuck regime, the output was \$200,000. The property has been turned over to the purchasers, and Henry C. Callahan, who was superintendent of it till last year, has been reinstated in that position.

CORTEZ.—*Silver State*, Aug. 1: Sam Jolin and Jack Houston came in from Cortez last week. Fourteen tons of \$300 ore have been shipped from their mine in Mill Canyon to Selby & Co.

THE MANZANITA.—*Transcript*, July 30: The incline at the Manzanita gravel mine is down 160 feet, and the bottom is in soft bedrock, through which progress is being made at the average rate of nine feet per 24 hours. Forty-eight feet was made last week. When a depth of 80 feet more has been attained, drifts will be started. The stockholders feel more than satisfied with the result of operations thus far.

DROMEDARY MINE.—*Grass Valley Union*, Aug. 2: It is in contemplation during the present season to effect an organization to reopen and work the Dromedary quartz mine, within the town limits on Wolf creek. It is very well remembered when this mine produced remarkably rich quartz, during the time that John T. Bradley was superintendent; but like all mines, it had its poor streaks, and subsequent to Bradley's management its owners failed to make it pay, and financial difficulties finally caused the mine to shut down. Years after the Dromedary shut down, rock from the old dump pile was hauled and broken up on Main street for macadamizing purposes, and quite a number of pieces were found to be rich in free gold.

CALIFORNIA.—The new hoisting and pumping works on the California are making good progress. The new plant is to take the place of the temporary one that was put up for prospecting purposes, the developments warranting the erection of heavier machinery. The new works will be ready to start up early in September, and in the meantime a five-stamp mill will be in process of erection, which will be ready to crush ore by the middle of October. These surface improvements will require an outlay of not less than \$8000. When the new hoisting works are completed, it is the intention to sink the main shaft 200 feet deeper with as little delay as possible, and two new levels will be opened. The mine in the north drift of the present lower level is looking well, the drift and stope carrying a well-defined vein of high-grade milling ore.

WYOMING CONS.—Some very handsome pieces of quartz from the Wyoming Cons. were brought to town on Friday, that were taken out within 16 feet of the surface. The quartz showed well in free gold and gold-bearing sulphurets, and was encouraging to the company as to what may be found when the vein is opened up so as to give backs to work upon. The new incline shaft is now down 60 feet, and it is contemplated when more depth is attained, to run crosscuts into two veins that are known to be in the location. The vein above spoken of is a strong one, and is a continuation of the Lawrey vein on Winchester Hill.

PEABODY.—A new level is being opened in the Peabody 75 feet below the No. 2 level, the drifts running both north and south from the shaft. The indications are good, and before long the pay shoot that was found above will be opened upon, which it is confidently expected will yield as well as it has heretofore. The pump is handling all the water easily.

GOLD FLAT.—The new hoisting-works building of the Gold Flat M. Co. on Gold Flat is up, and the timbers are being put in on which to place the machinery. It is expected that everything will be in readiness to start the underground work by the 1st of September.

Plumas.

JOHNSVILLE.—*Cor. Plumas County Bulletin*, July 1: Having obtained an elevation of 7000 feet, the town of Johnsville was reached. Its population of 500 souls is supported entirely by the mine. The fine 60-stamp mill, shops, office, boarding-houses, etc., belonging to the company are located here, all well built, neatly painted and presenting a thrifty and business-like appearance. The substantial and conservative methods employed in the management of the company's property are noticeable throughout. Eureka Peak, bare, castellated and abrupt, rises some 1500 feet from the bench on the west bank of Jamison creek, on which Johnsville is built. All over the face of this mountain, and extending nearly to its summit, the past and present workings of the great mine are to be seen. Some tunnels are marked by dumps of waste,

others by shops, timber sheds and covered tramways.

JAMISON.—Situated about a mile east of Eureka, and upon the opposite side of Jamison creek, is the property of the Jamison M. Co. Preparations are here in progress for extensive operations. Tunnels are being run and shafts sunk in the development of the property. Substantial buildings have been erected for office, boarding and store houses and other purposes. Arrangements are being made this season to put up machinery for hoisting and compressor purposes. Water is the motive power to be used and is brought in 22-inch pipe under 450 feet pressure. A fine ditch of a mile in length conveys the water from an inexhaustible source of supply. This consists of a chain of four lakes.

GOLDEN GATE.—*Plumas National*, Aug. 1: Wm. Monroe, once amalgamator at the Reno Reduction Works, arrived in town Friday morning. He will take charge of the Golden Gate mill, which will start up in a day or two. This is the name of the mine owned by Messrs. Barker, Sutton, Braden and others. Wade Hayes, a miner who worked on the Middle Fork in the early fifties, but who recently came from the lower country to search for a rich quartz vein, found it one day last week. It is about a mile below Old Nelson, and is reported to be rich. Schmidt & Co., of the Bonanza mine, are in with their tunnel 425 feet. For the past five or six weeks they have had very hard rock to contend with, but are now through it in good picking rock. They think that 75 feet more will let them into gravel. While at Johnsville, on Monday, we were shown a piece of gold by P. Lorenza that was picked up one day last week by "Commodore," a Greek, who is mining in Jamison creek, just below Johnsville. It was worth \$101. Mr. Lorenza had several other nice specimens that came from the different mines in that section. J. C. Knickrem showed us a nice specimen that came from the Ohio Point claim, situated at the head of Mohawk Valley, and owned by Knickrem & McKenzie. It was pure gold, and weighed \$80. This claim is about a half-mile below the famous Steelman & Hayes claim, from which a cleanup was made last year of \$45,000.

San Bernardino.

THE TIN MINE.—*Riverside Press*, Aug. 1: Col. E. N. Robinson informs us that a good many erroneous statements are being made by reporters and correspondents concerning the tin mine. They are not employing 250 men, but only 80 at present. They have not sent for a dozen English concentrators for they have the Frue, a better machine than anything made in England. They have no new-fangled five-stamp mill which does the work of 20 ordinary stamps, but are putting in an additional 10 stamps, which will crush 45 tons each day, besides the five tons crushed by the present experimental mill. They will then be able to get out 60 or 75 tons of metal (cassiterite) per month. All fabulous statements of daily output of tin are absurd. The furnace has not been burned out, and been replaced, as stated, but the brick bottom, which was of a poor quality, has been relaid with fire brick. They can profitably separate the tin from the ore, which goes 1½ per cent. The very rich ore such as goes 50 or 70 per cent (of which specimens are on exhibition) is not so easy to work as the lower grades. It holds so much metal that it sticks to the concentrator. Five or ten per cent ore is the best to work. All is prospering at the mine.

THE GABRIEL MINES LEASED.—*Riverside Enterprise*, July 24: The Gabriel gold mining district, comprising 4800 acres of the mineral and agricultural land of the San Jacinto Estate (Limited) with its valuable veins of gold and other minerals (excepting tin) passed yesterday into the hands of M. C. Westbrook, who, for himself and associates (Eastern capitalists) have acquired a ten years' lease of the property. The policy evidently, of the company who own the estate is to "farm let" as much as possible of their immense territory to small holdings, and confine their energies and capital exclusively to the development of their tin mines and the production of that metal. The lease given by the English company to Mr. Westbrook is for five years with the privilege of ten. Active work of development will be immediately commenced under the general management of the lessee with the able assistance of J. H. Crossman, that well known and veteran mining expert, as superintendent. Mr. W. proposes immediately leaving for San Francisco for the purpose of purchasing suitable machinery for the development of the property. Both the lessees and lessors are in Riverside to-day, for the purpose of ratifying the contract by legally signing the papers.

Shasta.

OLD DIGGINGS.—*Redding Free Press*, July 18: Since the bonding of the Mammoth mill prospects are brightening up in Churntown and Old Diggings mining district, and we are looking forward to a prosperous future. At present there is unusual activity going on in the various quartz lodes that intersect this district. The Calumet Mining Co. is working three men in the mine and about 15 men are employed at the mill. The ore which it is at present extracting is worth from \$80 to \$90 per ton. The next claim upon the lode is the Flannagan & Lynn. Considerable work has been done upon it, but at present writing one of the owners is wielding a sledge and drill at the Calumet, while the other is looking after his store in Churntown. If a little energy were infused into the working of this ledge (it being practically the same as that upon which the Calumet and the Utah Consolidated are located) there might be another mill or set of arrastras at work here. At the Utah Consolidated (Walker Bros.' mine) the regulation quantity of deadwork is being done. 'Tis a pity that this mine, with the fine plant which they have upon the river, has failed to give satisfaction to the owners by the working process tried in the past. Next in the line is the Bavaria, owned and worked by George Bear. The owner is hard at work driving the lower tunnel, hoping against hope that ere long he may uncover a bonanza. One shipment of ore from the upper workings netted him \$33 per ton over expenses, but there is very little of that kind of ore in sight. The Puritan, owned by Archie McKinnon, shows an occasional prospect from the surface croppings. As the owner has got nothing but muscle for capital, he cannot give the necessary attention to development. The Evening Star, owned by Frank Panter, has a tunnel driven upon the ledge for about 120 feet, showing one ledge of fair-grade ore, about 20 inches in width, and another parallel ledge, barren. Within the exterior boundaries of this claim there are five

or six small ledges which may possibly show up under further development. The Kit Carson and Spanish claims, formerly owned by Tom Harrison of Quartz Hill, but now in possession of Joshua Hendy of San Francisco, are idle at present writing. The only work done upon the Gertrude, owned by Mr. Anthony, has been a shaft about 25 feet in depth. At the Central, the Thompson boys are driving the new tunnel ahead, night and day. They expect to tap the ledge by September. If so, that means the starting up of the Central mill and the addition of another bullion-producer to the credit of Old Diggings. The new company which has taken hold of the Mammoth is making things lively, building roads and fixing things generally. They have leased the Walker mill and mean to have the quartz teams jogging over the grade thereto next week. The opening of this mine will add at least 70 men to the population here. The bond of the Mammoth includes the Bell and Garfield claims, thus giving the new company plenty of room for muscular exercise. The amount of work already done upon this property is quite extensive, the upper tunnel being 550 feet in length, the lower one 704 feet. There has been a large amount of ore extracted from the Mammoth proper, and there is plenty of ore in sight. The general average of shipments under the old control was \$250 per ton, and some of it went as high as \$3000. The character of ore is free gold and iron sulphurets. The Texas Consolidated keeps up its repute for both quantity and quality of ore produced. There must be gold bars in sight which require no effort to reduce, if we take into consideration the amount of improvements already made and those in contemplation—since last September a new ten-stamp mill and a full equipment of concentrators; also a new cable road for bringing the ore from the mine to the mill. Now comes an additional ten stamps and four new concentrators. Last, but not least, is the La Grippe, owned by Frank Young. This is the northeast extension of the Garfield. A tunnel about 120 feet in length has been run upon it. Frank expects to tap the ledge by driving. The croppings of the ledge, so far as prospected, show well in free gold.

CUSTOM MILL.—*Shasta Courier*, July 18: A steam driven custom quartz mill plant at this place would undoubtedly pay, as this is the centre of a country containing countless ledges, ore bodies, veins, pockets, and all sorts of formations that contain valuable minerals. A mill here would be furnished hundreds of tons of ore free for a starter to owners of ledges desirous of learning the value of their quartz by actual working process. Who will take advantage of the opening and put up a mill? There is money in it.

Sierra.

WIDE AWAKE.—*Mt. Messenger*, August 1: Freddy Bosch, superintendent of the Wide Awake mine, was down on Wednesday last, and says the mine is looking splendid. The gravel is paying and improves every foot they advance down the slope of the bedrock.

YOUNG AMERICA.—The following were elected officers at annual meeting of the Young America Co., G. M. Co. Directors: G. H. O. Sanderhaus, Watt Hughes, A. C. Bush, Thomas Brennan and J. H. Knuthson. Thomas Brennan was elected Pres., and J. H. Knuthson, Sec'y of the Company.

Slackuou

BLUE GRAVEL.—*Yreka Journal*, July 29: The Yreka Blue Gravel Mining Co.'s shaft is now down about 60 feet, and the indications of striking good pay seem to be gradually improving. Two more men have been added to the force this week to continue the work day and night, with greater rapidity. The ground cut through, contains a mixture of sandstone and blue gravel, a very good sign of an ancient channel where the hill now exists along the eastern side of Yreka. The river miners on the Klamath are rushing along the work of hoisting pay gravel, carrying on operations day and night. Only a few have yet reached the bedrock, but all will be down in a very short time to realize high pay. The quartz miners in Scott valley and at Indian creek, Humburg, Deadwood, Salmon river, and various other quartz mining districts are getting out quartz constantly, from which good returns are realized. Lee, Lash & Co., have reached bedrock in their new shaft near the stage-road, and find that blue gravel does not extend so far in that direction from their old shaft, or else takes a turn in a different course. They will sink another shaft nearer the first one, and then follow the course of the blue gravel channel, so as to keep directly on it. When they were obliged to quit work by a cave in their old drift, they had just reached the richest pay, and will probably open another shaft at that point.

Trinity.

NEARLY READY.—*Journal*, August 1: Mr. Arnold informs us that he has the Thanksgiving mine on East Fork in good working shape. There was a little drawback caused by the machinery not being in good order or the mill would have been running now. It is expected, however, to have everything running systematically by Monday or Tuesday. They have about 100 tons of ore out and Mr. Junkans, the owner, is looking forward with a great deal of interest to the first clean-up.

THE RIDGEWAY.—News has been received from New River that the Ridgeway Co., have made connection with their old shaft and as a consequence work will progress much more rapidly now. For sometime the air has been very bad in the tunnel and upraise. The ledge runs from four feet upwards and will probably go not less than \$20 per ton. They are now getting ground opened up for systematic working. A test run will be made of the rock sometime this month.

NEVADA

Washoe District.

CDNS. CAL. AND VIRGINIA.—*Chronicle*, August 1: There has been extracted from all parts of the mine during the week 1681, 1410-2000 tons of ore, of which 122, 910 2000 tons was shipped to the Morgan mill and 1550 500-2000 tons to the Eureka mill. The average assay value of all of the ore worked at these two mills during the week (2285 tons) was \$24.50 per ton. Bullion shipped to Carson Mint, assay value \$47,762.97. Bullion now on hand in our assay office, assay value about \$26,500.

OPHIR.—1465 level: We have continued our prospecting work from the openings in the vicinity of the point where the upraise from the sill floor of

this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level. All the ore on hand which had been accumulated from recent exploration, amounting to 259, 1860-2000 tons, has been shipped to the Morgan mill and it is now being worked at that mill.

MEXICAN.—On the 1465 level the south drift started from the east crosscut No. 1, at a point 618 feet from the main north lateral drift has been advanced 35 feet; total length, 92 feet; in vein matter showing clay separations.

UNION CON.—The northeast drift started from the east crosscut No. 2 on the 1465 level, at a point 833 feet from the main north lateral drift has been extended 30 feet; in vein porphyry carrying some clay.

OCCIDENTAL.—Extracted 40 tons of fair-grade ore from the stopes on the 350, 400 and 450 levels, and 10 tons per day from the 600 level. The south drift from No. 2 crosscut on the 650 level is in ore of the average value of \$22 per ton. Milled during the week 325 tons of the average value of \$17.30 per ton.

UTAH.—At a point in the south drift, 52 feet from the winze station, a southeast drift has been advanced 46 feet in porphyry and clay.

ANDES.—On the 420 level east crosscut No. 2 from the main north drift was advanced 21 feet; formation porphyry. East crosscut No. 3 was extended 30 feet and discontinued. From east crosscut No. 3, 85 feet from the main north drift, a north drift was started to-day in quartz.

CHOLLAR.—The station at the 1500 level is completed, and are now sinking for a chute. Extracted and sent to the mill the past week 520 tons of ore, worth \$19.40 a ton as per battery samples.

POTOSTI.—The winze is down 67 feet below the 1500 level. The bottom is in porphyry and stringers of quartz.

ENCHERQUER.—East crosscut on north line, 600 level, is out 270 feet; face in porphyry.

BULLION.—The south drift, 1300 level, is out 290 feet from north line; face in clay and porphyry.

ALPHA.—North drift from west crosscut, 100 feet north of shaft, 500 level, is out 52 feet; face in quartz yielding low assays. South drift from winze, 80 feet north of shaft, 550 level, is out 47 feet; face in quartz, yielding low assays.

WARD SHAFT.—The south lateral drift from the 1800 is out 184 feet; face in porphyry.

NEW YORK.—West crosscut from north lateral drift 600 level, is connected with the raise from the 800 level. The west crosscut from the north lateral drift, 590 feet north of shaft, 1100 level, is out 20 feet; face in porphyry.

SILVER HILL.—The southwest drift, 50 level, is out from the shaft 220 feet; face in porphyry. South crosscut, 160 level, is out from the winze 640 feet; face in hard porphyry.

SIERRA NEVADA.—On the 630 level, west crosscut No. 1, from the northwest drift, 571 feet from the shaft, is advanced 761 feet, 37 feet having been made during the week, continuing through the same formation.

GOULD & CURRY.—On the 200 level upraise No. 2 from north drift has been carried up 11 feet; total 106 feet; face in quartz showing some value.

Hawthorne District.

LAPANTA.—Walker Lake Bulletin: Stope above the east drift, No. 6 incline, still producing the usual amount of high grade ore. East drift from the winze below the 100-foot level has run into a large body of iron and quartz, running about \$30 per ton, the body being evidently quite extensive. Sinking on a small vein of high-grade ore below the west drift, No. 6 incline.

PAMLILO.—Main tunnel has intersected the vein driven for; same shows about two feet wide, pitching northeast.

CENTRAL.—Extracting ore as usual. Shipped two cars of ore this week.

MOUNTAIN KING.—North drift on the main ledge tunnel level has been extended ten feet; the vein about two feet wide; ore improving in quality.

FAIRMOUNT.—Driving the main south drift ahead; vein about two feet wide, carrying streaks of quartz and metal all through the same. The winze below the drift is down 30 feet—the vein running from four to eight inches high-grade ore.

HARTFORD.—Still opening the vein on the surface, showing good ore.

CAPITAL.—Working on the feeder; expect to reach the ledge in a few days. Encountered antimonial silver of a high grade.

GOLD BAR.—South drift, Martinez level, still being extended; ledge about ten inches wide, carrying some very high-grade ore.

IDA.—Still producing the usual amount of ore.

NEW YORK.—South drift from the tunnel being extended on the vein, which shows about 18 inches wide in the face, a considerable portion of which is heavy galena.

RIP VAN WINKLE (Marietta).—Main tunnel has been extended eight feet, showing six inches of galena ore in the face.

JENNY LIND (Marietta).—The northwest drift has been extended six feet; the vein about 24 inches wide; 65-ounce ore.

Tuscarora District.

NEVADA QUEEN.—Times Review, July 31: South drift from east crosscut, 414 level of Commonwealth, has been advanced 11 feet.

NAYAJO.—South intermediate level extended 19 feet; the face is not looking well.

DEL MONTE.—Third level—No. 1, north drift advanced 20 feet; assays from face as high as \$32.75 per ton. No. 2, north drift advanced 21 feet; vein 5 feet wide; ore showing all through.

COMMONWEALTH.—Fourth level—No. 1, winze is down 28 feet, passed through the ore 15 feet below the level; winze will be continued straight, as there is less water than in the ore, and crosscut at 50 feet.

BELLE ISLE.—Line crosscut, 350-foot level, extended 17 feet; rock is getting harder, and progress is slower. The winze on this level has been extended 25 feet; the vein is strong, but not so rich. Seventy feet of the Williams crosscut, same level, has been cleaned out. Work has been resumed in the line crosscut, 450-foot level.

NORTH COMMONWEALTH.—First level—Stopes have yielded 10 cars of ore; average assay, \$300 per ton. Third level—No. 1, winze extended 6 feet and north drift from bottom, 12 feet. No. 2, raise extended 15 feet, cutting about 3 feet of ore, some of which is high grade.

NORTH BELLE ISLE.—East crosscut from the south gangway, 400-foot level, extended 14 feet. The upraise on the east vein, same level, extended 9

feet in hard rock, showing many seams of good ore. West crosscut from the north end of Belle Isle, 450-foot level, extended 14 feet.

Pioche District.

PROSPEROUS.—Pioche Record, July 30: Ed. Robinson, of Patterson district, was in town during the week. He reports the mines in that district as having a most prosperous outlook. Mr. Robinson brought some hand-samples into town which assay very well in lead and iron. The ore in the Patterson district has heretofore been of a milling character, but he now has some good smelting ore.

ALASKA

SHEEP CREEK.—Juneau Mining Record, June 29: The Silver Queen Co.'s mill recently built has ten stamps and four concentrators and its arrangements are complete in every particular with a sufficient water power to operate a plant many times larger. The stamps were made by the Risdon Iron Works, S. F., and were taken from the mill erected on the celebrated Bear Nest property on Douglas island which failed to hear the anticipated golden fruit. The mill was pronounced by those who are familiar with mining as one of the best mills they have come in contact with on the coast. The ore is brought in wagons from an ore bin about one mile from the mill where it is run down in a chute from the tunnel. The ore is of a first-class milling quality and about 30 tons is crushed daily. It is the intention of the company to put in a track tramway for the delivery of the ore from the mine to the mill which will greatly reduce the cost of ore transportation.

ARIZONA.

TOO MANY MINERS.—Tombstone Prospector, July 31: A. L. Walker, superintendent of the Old Dominion Copper Co. advises miners and all laborers to give Globe a wide berth as there are now ten applicants for every vacancy.

GLOBE.—Cor. Florence Enterprise, July 27: Globe is very quiet but many say it is the best camp in the territory. The Old Dominion is progressing finely with the foundation for three massive new 80-ton smelters. Everybody, nearly, thinks that it will bring a railroad. The Rescue mill is now pounding ore day and night with several hundred tons on the dump ready for the stamps and a good force taking out more. The general opinion is that the Rescue is a permanent property. In the Fame a good pocket has been struck lately but the matter is kept quiet.

BRITISH COLUMBIA.

ON TOAD MOUNTAIN.—Nelson Miner, July 25: The Dandy Co., in stripping the ledge above the lower tunnel on the Dandy, last week uncovered a body of fine-looking ore, which gives higher returns than that from the surface on the upper end of the claim. The road has been swamped and the stumps blown out, so that machinery can now be got on the ground. At the Grizzly Bear, the tunnel face is under cover, charcoal is being burned and the boarding-house is almost completed. On the Vineta Boy, Ben Thomas, Charles Malley and John Connors are sinking the shaft, now down about 30 feet, 50 feet farther. At the Cumberland, a claim recently discovered by Harry Ward, Charles Dundee and A. R. Seaman, a shaft is down several feet in ore that shows grey and peacock copper. The ledge is reported to be fully six feet in width and apparently in place. The manager of the Kootenay Bonanza M. Co. advertises for tenders for from 250 to 500 feet of tunneling on the Silver King, which means that the owners of that property want to know what they really have before they accept any of the offers made for it. The wagon road is completed to within a short distance of the summit of the mountain, and will be at the Silver King next week. About 60 men, besides those employed on the wagon road, are working for wages on the several claims on Toad Mountain. The only sale reported this week was the Lulu, a claim adjoining the Silver King on the north, to E. Ramsay, manager of the Kootenay Bonanza Co.

HOT SPRINGS DISTRICT.—Ore is being hauled from the Number One mine to the landing at Ainsworth for shipment to the smelter at Revelstoke. Over 200 tons are now sacked, and the contractors expect to haul from 6 to 10 tons a day. The mine continues to look away up, as does the Fourth, in the same camp. The Skyline crosscut had not reached the ledge up to Wednesday night.

DAKOTA.

SMELTER BLOWN IN.—Deadwood Pioneer, July 30: At 3:30 yesterday afternoon the D. & D. smelter was blown in, or, more properly speaking, the big blast furnace was charged with coke, limestone, pyrites and ore from the Maggie mine and a lighted torch applied. The machinery has all been in operation for the past ten days and the large bins filled with crushed ore, limestone and pyrites. Dr. Carpenter was seen at 8 o'clock last evening and said that apparently everything was running as smoothly as could be desired. It will be run with eight and day shifts. The boiler that supplies the steam for the motive power only consumes three tons of Newcastle coal every 24 hours. The most remarkable thing about the construction of the plant is that not a pulley, piece of shafting or other machinery had to be changed from the original setting or position. It was all planned by and set up under the direction of Dr. Carpenter.

IDAHO.

A RICH FIND.—Wood River Times, Aug. 3: Col. Wall, special agent of the General Land Office, got back from the upper country to-day. He reports that the best strike ever made in that country was made three or four days ago by John Christenson, at a point about four miles from Bay Horse, and within a claim or two of the Ramshorn mine. The vein is very wide and so easily worked that two men can extract more ore than four men can hoist. The ore is very rich.

THE NETTIE MINE.—E. H. Porter, managing owner of the Nettie mine, which is at the head of Narrow Gauge gulch, and reports having 14 to 18 inches of ore that runs 200 ounces silver and 60 per cent lead, and they have 75 feet of backs to stope

on this. The mine has paid the owners at the rate of \$1300 per month in dividends while doing dead-work, such as sinking a winze, and now that it has been opened so as to have large stoping ground there is big pay in it. Ore is being shipped.

PLACERS NEAR ELK CITY.—Spokane Chronicle, July 31: Mr. C. D. Galvin, agent for the Chicago Board of Trade, arrived a few days ago from Elk City, Idaho. Mr. Galvin is an interested party and also the agent of one of the largest placer mining companies that is operating in that part of the Territory. The intentions and operations of the company have been kept secret for some time, but now its plans are fully matured and everything in readiness for work. The country in the vicinity of Elk City has been famous for many years as a region of rich placer mines. The Chicago Board of Trade has purchased contiguous claims in that section to the amount of 950 acres, and will put in an extensive placer mining plant. "For a time," said Mr. Galvin, "we kept quiet about our doings in the placer region, but now we are ready to talk, if the people want to listen. We have all the claims we want, and we are satisfied that they contain immense quantities of gold. We intend at first, however, as a precaution, to work three or four acres in a primitive way, by scraping off the top of the soil until we reach the pay gravel, and then we will wash it out in old-fashioned sluice boxes. If it pays half of what the prospects have all along indicated that they would, we will go on with the work. We have an abundance of water handy, and the land lies in a most advantageous position. Mr. A. B. Stetson, the engineer in charge for ex-Governor Taylor of Montana, who is also working a placer mine, will be here to-morrow, and will visit the property with a view of making the necessary estimates, etc., for the plant, which we expect to cost about \$40,000."

BUNKER HILL AND SULLIVAN.—Wardner News, Aug. 1: In a few days the Bunker Hill & Sullivan M. Co. will commence grading a site for another concentrator equal in size to the one now in operation, which will increase the concentrating capacity of the works to 800 tons per day. The company are encountering in their mines low-grade ores which will yield profit only by handling on an extensive scale, and the addition to the mill is made with a view to treating such ores as have been heretofore profitless. The increase in the capacity of the Bleichert tramway from the mines to the mill has been completed and ore is now delivered at the rate of one ton per minute, and in a few days mining timber and cordwood will be brought up in buckets on return trips to the mines. The new concentrator will be built substantially upon the same plan as the present one, which has proved so remarkably successful. The only change in note will be the adoption of the Gates crushers in place of the rolls. This will be an entirely new feature in this class of mining work. The company is encouraged by the great success attending the use of these crushers at the mines, where the "Gates" crushes 150 tons of ore per hour as it is dumped from the cars, or 7½ times as much as a 9x15 Blake does by its side. The arrangement of the Gates will be such as never to require any stoppage of the mill for repairs on these machines. There will be 32 jigs of from two to four compartments, two double-deck slime tables and four Frue vanners. Power will be generated from a 30½ Lefell wheel. The ore will be conveyed to this new plant from the present ore bins by an endless iron trough conveyor, feeding into the Gates crushers. Screens and hydraulic classifiers will be used for sizing as practiced at present. In place of belt elevators, the Morris reversible centrifugal pump will be used for returning middlings, etc., to the screens. These pumps are made specially for the work, being cast 1½ thick. The mill will be in operation by the first of next January.

MONTANA.

AT BUTTE.—Miner, July 30: Activity among the mines, mills and smelters during the week has been as great, if not greater, than it has at any time within the last four years. The Lexington, Alice, Bluebird, Moulton & Butte and Boston companies shipped their regulation weight of silver and gold bullion, in addition to the Colorado, Butte Reduction, Boston and Montana and Parrot shipped many tons of copper, several thousand pounds of silver and a few pounds of gold in the conglomerate mass known as matte. This latter product is always shipped as freight and its exact weight is not therefore generally known. The coming week promises to be even better than the one just past, as several new leases and other properties will be started up. During the week the Butte & Montana Co. came to the front with dividend No. 13, which swelled the total amount from date of organization four years ago to \$2,075,000. In addition to this the company has about \$1,000,000 surplus on which it is drawing for the building of the new smelter at Great Falls. At the old Colusa smelter a few changes are in progress with a view to putting the furnaces in better condition. At the St. Lawrence mine two large steel tanks are hoisting the water from the shaft and lower workings, which yet contains about 400 feet. At the Anaconda, one tank is kept running steadily. There is a rumor in the air to the effect that work in these two mines will be resumed in about three weeks, at which time it is thought the water will all be out, but it is a rumor only. The 1400-foot station of the Alice shaft will be finished to-day and sinking for the 1500-foot level will be continued without interruption. The machinery for the new air-compressor is arriving, and in a few days the property will be supplied with as good a piece of machinery of this kind as can be found anywhere outside of the Comstock mines. For the last few days the Magna Charta and Blue Wing mines belonging to the Alice Co. have been working only about half time. The reason for this is the fact that the Alice proper is yielding more ore at present than it has at any time since the company assumed control of it. The Butte & Boston Co. is one that has accomplished marvels since its first commencement of operations in this district. From its No. 1 mine near the Silver Bow mill it has for some time past been taking out between 9000 and 10,000 tons of ore a month, which is all treated at its smelter here. A great deal of matte is turned out by it monthly. It is safe to say that the record of this company in the three years of its existence has not been surpassed, if equalled, by any other in the State at the same stage of development of its mines.

NEW MEXICO

IRON.—W. H. Newcomb's iron shipments from here have averaged 150 tons per day for the last 20 days. Jo. Avery and others, who have been leasing on the Flagler mine, shipped a carload of ore this week. The Maud S. Silver Creek mill is being put in shape and will soon start up. A big body of ore, over 18 feet in width, has been struck in the Last Chance. It averages from \$15 to \$19 per ton. The Anson S. Smelter will blow in Monday next. Frank Miltstead and Max Schultz have secured a lease on the Bremen mill, and are now putting it in shape. They will work custom ores. Teams were sent to Carlisle this week for a hoisting plant purchased from John A. Miller, which will soon be put in place on the Hohson group. John S. Dodd, manager of the Alhambra, came in Tuesday from the mine, bringing ten tons of rich ore, which was shipped to Socorro for treatment. John Bragaw was over from Georgetown this week to ship a car of rich ore to Socorro. He will soon add two vanners to the Payne, Washington & Co.'s mill and start up on low-grade ore, of which he has a large amount already on the dump.—Silver City Enterprise, July 31.

OREGON.

CLEANUP.—Jacksonville Times, Aug. 1: The annual cleanup is now progressing at the Sterling mines. E. Sanderson Smith, the well-known mining expert, has been in Josephine county looking for asbestos, and brought home several specimens. Asbestos is being searched for by many in Southern Oregon, and if a large deposit of a merchantable article is discovered, it will be a big thing for all concerned. The San Jose capitalists who recently bonded the Pilgrim ledge on Wagner creek have concluded not to take the property, although they admit that it must prove valuable when developed. They are looking for property that is already opened up for work. The great nickel-silver mine near Riddle station is beginning to attract general attention, the vast body of ore to be there found, exceeding anything of like character to be found in the State, or perhaps on the Pacific Coast. The entire mountain seems to be one mass of high-grade ore, which teems with undeveloped wealth.

ASBESTOS.—Daniel Reynolds of Evans creek, one of the original discoverers of the asbestos mines, is in town. He informs us that Mr. Tyler, in the interest of a Tacoma company, has located a large quantity of ground in that vicinity and will soon work it on a large scale. Mr. R. has located claims with several others, and showed the reporter a handsome specimen of the material. There seems to be every probability that the asbestos has been found in extensive and paying quantities.

UTAH.

NEW LOCATIONS.—Park Record, Aug. 1: Con. Hunt, Geo. Roberts and a man named Fife have made several locations recently in the Bear River mountains, about 50 miles from Park City. They have uncovered a vein of mineral about four feet wide, with regularly defined walls, that looks quite promising. Mr. Hunt brought some of the rock to Park City, and is having it tested for silver and gold. The work of sinking the new shaft on the Meears is going forward rapidly. A steam hoist is in position and 135 feet have been sunk in 18 days. Three shifts are working. The water at the Silver Key is increasing instead of diminishing, and work in the face of the tunnel is being carried on under difficulties. Repairs at the Mackintosh sampler have been completed, and the mill is again in active operation. The changes in the machinery consisted in a rearrangement of the conveyors in such a manner that the labor of three men is saved on that piece of machinery alone; besides, it makes the whole mill much more convenient and commodious, and ore is handled much easier and more speedily than of yore, and yet Mr. Rookledge says it keeps everything moving constantly to handle the ore that is now coming in.

ORE AND BULLION SHIPMENTS.—The Ontario mill shipped this week 35 bars of bullion, containing 22,598.74 fine ounces of silver. The Crescent shipped this week 220,500 pounds of first-class ore and 268,500 pounds of concentrates; total, 489,000 pounds. During the past two weeks there has been received at and forwarded from the Mackintosh sampler the following lots of ore: Ontario, 741,650 pounds; Daly, 602,150; Anchor concentrates, 768,330; Roaring Lion, 18,210; Nevada-Northland concentrates, 18,860; Wedge, 230,180; Alliance jig ore, 12,380 pounds; total, 2,391,770 pounds.

WASHINGTON.

KITTITAS CO.—Ellensburg Capital: At no time in the history of Kittitas county has there been so much interest in and excitement over mines as at the present time. Hardly a day passes that pack horses are not seen on our streets loaded with supplies for the sanguine prospector, whose hunger for wealth has been increased by the reports which are being constantly received from the surrounding camps. These prospectors are not all Ellensburg people, but they come from all directions, particularly from the Sound region, where the fame of our mines is being circulated, and where many are to be found who believe in them and prove their faith by trying to get in to time to secure a share of the precious metal which they believe we possess. This is not an undue excitement, but is a long-deferred waking up to the important fact that Kittitas county has the richest mines and more of them, of all kinds, than any other county in our great State. It is a natural result which should have been demonstrated years ago, and which, in any other country, would long ago have created a furor. Our county has heretofore enjoyed the reputation of being a great placer region, and on this score most of its fame has been achieved. It now seems, however, that the placers are of small importance compared with the rich ledges of gold and silver-bearing ore which are constantly being discovered. Already these miners are crying for mills to work their ores. They themselves, as a class, are unable to put up mills, but it is not probable that they will have to wait long, for capital will be quick to see what a fine investment is offered in this line, and it is safe to predict that stamps will be dropping in the mountains before snow flies. All these features indicate that Kittitas county is now entering upon an era of prosperity such as she has never known, and will soon be famous as a producer of precious metals.

MECHANICAL PROGRESS.

Modern Inventive Activity.

One of our valuable exchanges remarks that down to the beginning of the last century men had invented very little. They had necessarily contrived a great deal. They learned to make boats so far back in the legendary ages that history could only find a place for beginning after men had been taught to navigate the sea. But then the boat is only an evolution of the log floating on the water, and it came into form by such easy gradations through the raft that it is hardly to be called an invention. So with most of the household implements, and even of the tools of mechanics that have long been in use. They grew by such slow processes from the crudest beginning that no man could be called their inventor. As we look back beyond the beginning of the last century, we discover barely more than a half-dozen new devices that could justly be called inventions. The art of printing is the most conspicuous of these few; but even this invention was so simple that one cannot help feeling that the old monks who copied manuscripts for centuries must have been exceedingly stupid, or they would have created the art at a much earlier date.

But the inventive activity of the present age is a source of continual wonder, and it is difficult to explain the impulse that leads to its indulgence. Much is attributed, and much doubtless is due, to the patent-right system; but this will not explain everything. A few fortunes have been made by inventors; but it is notoriously true that the authors of new inventions rarely realize much for their happy thoughts, and few men would ever think of turning their attention to invention as a profession. Vastly the larger number of inventions are the work of men who have merely conceived a good idea, and then proceeded to put it in mechanical form because their idea has made them enthusiastic. In such cases they may have been stimulated somewhat by the hope of pecuniary reward; but it was not this hope that gave the impulse to their labor.

A WONDERFUL MECHANICAL PROCESS.—The process of rolling railroad rails, of Bessemer steel, as practiced in Germany, is declared to be one of the most perfect mechanical operations in the world. The steel is cast in hocks which contain sufficient material for two or three rails, these hocks, while red hot, being carried to the preparatory rolling mills by horses which have been trained to work in the midst of this fire and noise; here they are kept hot, in special furnaces, and are rolled into longer hocks having a square cross section. After being thus prepared, they are taken to the rail rolling mills, which consist of two complete rolling mills, with all the appurtenances in one apartment, and the hocks which come from the preparatory mills are heated again and then passed between the rollers, of which there are three placed one above the other, so that the rails are rolled during the backward as well as the forward motion without requiring a change in the direction of rotation of the rollers. The rails have to pass back and forth between the rollers 13 or 14 times, and each time that they come from the rollers they are caught by the workmen on the short, bend ends of long levers which run on rollers on movable carriers. Each time the rail passes from between the rollers it is longer and its cross section narrower than after the former rolling, until it finally stretches itself out like a gigantic fiery snake; it is then taken to a circular saw, which cuts through the glowing metal with perfect ease, dividing the long bar into two or three rails. The cold ring is now put under presses, by means of which the slightest irregularities are removed, and then the holes are bored, the end surfaces evened, etc.

WOODEN JOISTS VERSUS IRON FOR BUILDINGS.—In his recent lecture on fire prevention, Professor Goodman states that, generally speaking, wooden joists are better for building than steel or iron joists. The two latter materials, he explained, lose their strength at a not very high temperature, whereas wood would sustain a heavy strain for a much longer period when exposed to great heat. Besides, when wood has once been charred, it does not burn so readily again. Iron and steel soon expand under the influence of heat. Brick and stone are objectionable; the former become fused under great heat, and the latter is liable to crack or fly when suddenly cooled after heating. The drawback to tiles is that when fire plays upon the joists of floors fitted with them, the joists expand and allow the fire to play upon the joists through the tiles. Portland cement is objectionable, as it flakes off when heated, but if wire netting or bars are imbedded in concrete, this defect is remedied. A joist padded with elastic of cotton and incased in Salamander plaster (a mixture of allstate, cotton and plaster of Paris), the professor holds, is a splendid fire-proofing material. Such a material is not only a non-conductor, but it is elastic, and would yield with the joist. In an experiment undertaken by Professor Goodman, it was found that a joist of this kind withstood fierce heat for eight to nine hours without sustaining any serious damage.—*The Builder*.

MONSTER GUNS.—Two monster Russian guns were sent recently to Sebastopol for the purpose of being placed in the new ironclad

Sinope, and although some of the details must be inaccurate, the official description is too interesting to be ignored. They are 12-inch pieces, weighing 50 tons, and throwing projectiles of nearly half a ton. The powder charge is 270 pounds, and the initial velocity 3000 meters, while the distance of the cannon's range is said to be 20 versts, or over 13 miles. As a consequence, the fire of the guns can only be directed by the map, the object fired at being out of sight. Two men, however, suffice for each gun, as they are worked by hydraulic machinery.

ALUMINUM COMING INTO USE.—The low price at which aluminum can now be produced is beginning to interest manufacturers and inventors in devising ways and forms for introducing it into practical use. The Electrical Supply Co., of Chicago have demonstrated the value of this metal, for the manufacture of certain lines of goods at least. They have recently brought out aluminum shade for incandescent lamps, which is said to be very handsome in appearance, being of a beautiful silvery white color and extremely light. The interior of the shade has a frosted surface, which has the effect of casting a strong and soft light upon the desk. The light is of such a character as to be very restful to the eye and there is no strain whatever imposed upon the organ sight. This new shade, no doubt, will be much appreciated by those who are desirous of securing a soft, diffused light to work or read by. The New Process Welding & Spinning Co., of Chicago, are receiving a great number of inquiries as to their new method of welding and shaping metals by means of the heat generated by friction. They have just completed some interesting practical experiments with aluminum, and are able to make perfect tubing of any desired diameter and length, out of sheet aluminum. It would appear that their patents are almost as valuable in working this wonderful metal, as in fashioning brass and copper. Parties in one of the Eastern cities have in process of construction a small steam yacht calculated to carry four persons, the whole of which, with its engine and propellers will be constructed of aluminum. The weight of the boat and engine will be only sixty four pounds. This will form a very interesting experiment.

PIPE DIRECT FROM BAR IRON.—Experiments have been going on at the Alikanna mill, Steubenville, O., for some time, on making pipe direct from bar iron. This plant is owned and run by the National Tube Works of McKeesport, and the machinery used in the new process was bought in separate pieces, so that their intention might remain a secret. This new departure in making pipe directly from steel bars will practically revolutionize pipe-making and the old way of rolling the iron into a sheet then curving and welding it, will be entirely superseded. The managers say machinery has been ordered to be placed in the tube works at McKeesport, where the new process will be used.

THE CORE SAW, intended for boring out barrels from solid logs, was recently completed at Taunton, Mass., for a company in Lacrosse, La. The saw is made of wrought iron, cylindrical in shape, and steel outer teeth are distributed about its edge. It was expected that the saw would cut a barrel per minute, and during a trial of the first machine a core 10½ inches in diameter and 21½ inches long was bored out in 30 seconds. A mill for the manufacture of barrels by these machines is to be built in Louisiana.

THE TWISTED WIRE NAIL.—A cross between a screw and the ordinary plain wire nail—is said to be working its way into popular favor, and is believed to represent as great an improvement upon the plain wire nail as that useful invention is over the old cut nail. The twisted wire nail not only crushes the fibers of the wood less than the two other forms of nail, but by its screw shape possesses a much greater holding power than the other forms.

AN AMERICAN BLAST FURNACE has recently been put up in England, as a matter of test between American and English furnaces. The furnace has been erected on the Tyne near Newcastle. The furnaces from which this one is modeled have produced 2500 tons of iron in a week, which is double as much as has been turned out in English furnaces. The result of the test will be looked for with much interest.

ALLOY IN COINS.—Americans use an alloy of one-tenth copper in making coins to harden them. The English use less—one-twelfth. Some time ago, the English Government filled two spinning cylinders—one with English coin and one with American—and set them both revolving. The former wore away much more under the shaking than the American did.

THE LARGEST GUN.—The credit of having manufactured the largest gun in existence is claimed by the Krupp Company. The gun, which is the property of the Russian Government, is made of cast steel, weighs 235 tons, and has a caliber of 13½ inches, and a barrel 40 feet in length. It fires two shots per minute, and each charge costs £300.

BILLS are now posted in Paris by machinery, which is said to be an improvement on the hand posted system.

SCIENTIFIC PROGRESS.

Science and Society.

The marvelous transformation that is being wrought in the civilized world by electricity is one of the wonders of all ages. No revolution in mechanical science ever affected society as does that wrought by electric power. It touches life at every point, modifying, extending, transforming all the methods of intercommunication. Space and time, which are the two attributes that limit all expression of life, are practically annihilated by this power. When one remembers that it is these very conditions of space and time that the philosophers have always instanced as differentiating the material from the immaterial worlds, one realizes how vast and even sublime is the force that overcomes them.

Within the past decade electrical science has made greater progress than in the preceding half-century. There is almost no industry or mechanism carried on to-day without its aid. But the outlook in the immediate future transcends any realization of the past. The street cars, and, in time, the railroad trains will inevitably be propelled by electricity. Houses will be lighted and heated by the electric spark, and we shall turn on the heat as we now turn on the gas, thus doing away with smoke, which of itself will have an important effect on the cleanliness of a city, and also on the health of the people.

The pneumatic tube must eventually solve the package transportation problem. If it solves package transportation there is no reason why it may not solve freight transportation as well, and the new invention to reproduce in facsimile every word and line of a letter, as it is being written, to the person addressed, by means of an upright immovable rod, fastened to the top of a writing desk, will certainly facilitate the swift delivery of mail matter. This last feat is now in use in New York between that city and Pittsburgh, and is an invention patented by Henry Etheridge, a noted electrician. The stylus with which the letter is written is fastened to the upright immovable rod at the top of the desk, and this, by electric connection, reproduces the writing exactly before the eyes of the distant correspondent.

Mr. Edison's new wonder should not be overlooked in this connection. To use his own words, he says: My intention is to have such a happy combination of photography and electricity that a man can sit in his own parlor and see depicted upon a curtain the forms of the players in opera upon a distant stage, and to hear the voices of the singers. When the system is perfected—which will be in time for the fair—the play of each muscle of the singer's face will be seen, every color of his or her attire will be exactly reproduced, and the stride and positions will be as natural as those of the live characters. All this will revolutionize all the means and methods of social life.—*Ez*.

The Tides.

The ocean tides, notwithstanding the amount of scientific search which has been turned upon them, are still largely an enigma, even to the scientists. There are phenomena connected with them which are difficult of satisfactory solution. All the phenomena connected with them have in all ages excited much curiosity. The difference of height at one time and another is a puzzle to many, although to the educated that phenomena is perhaps well understood. The usual extraordinary height and fury of the tides in some places is a wonder to many and is an interesting sight to all.

It is related of the soldiers of Alexander the Great, who were natives of the Mediterranean shores, that when they reached the confines of the Indian ocean and saw its waters rolling up to a great height, and then flowing back twice every day, they became alarmed and attributed the phenomena to a special interposition of the deities of the country which they had invaded. Various remarkable theories have been advanced regarding the tides. Many of these are truly as absurd that it is hardly worth while to refer to them. Persons find it difficult to understand why the tides are higher at one time than another, and why they rise to the height of 60 feet in the Bay of Fundy, 40 feet in the ports of Bristol, England, and St. Malo, France, and only rise to a few feet in New York and other places, while they are scarcely perceptible in the Baltic and other seas. Descartes was the first philosopher who advanced the theory that the tides were due to the influence of the moon, but Newton was the first who worked out the problem and discovered the true cause. Descartes held that the moon acted on the waters of the ocean by pressure. Newton demonstrated that it acted on the ocean by attraction—that instead of pressing the waters, it rolled them up directly under it, and also at its antipodes at the same time, thus producing the two tides every day.

The tides are attractions of both the sun and moon. If the earth had no moon, the attraction of the sun would produce two tides every day, but their ebb and flow would take place at the same hours, not varying as they do. These tides would also be much smaller than those of the moon. Although the mass of the sun is far greater than that of the moon, and though attraction is in proportion to the mass, yet it is also inversely as the square of the distance. As the sun, therefore, is 400 times

more distant than the moon, the attraction of the waters of the sea toward the sun is found to be about three times less than that of the moon. There are really two ocean tides—the lunar and solar—but the latter is absorbed by the former, which is wholly observable in respect to the time; the solar only as it influences the height of the tidal wave. That caused by the moon is three times greater than that of the sun, and it follows the moon's motion around the earth, rising and falling 12 hours and each succeeding tide later by three-quarters of an hour than the preceding one, exactly in accordance with the positions of the moon, or, as it is commonly called, its rising and setting.

NEW FISHES.—The *San Diegoan* of recent date says: Since the return of Dr. Carl Eigenmann, the ichthyologist, two new fishes have been discovered and named. The first was found by the dredger at work cleaning out the entrance to the harbor. With the sand the dredger brought up what the workmen called a worm, but which the ichthyologists called amphioxys lanceolates, which, it will be readily observed, is quite different. It was further shown that the workmen were wrong in calling it a worm, for worms are invertebrates, while the amphioxys lanceolates is a true vertebrate. How the workmen could have made such a gross error is not readily understood. The things are found imbedded deeply in the sand under the waters of the ocean. They are from two to three inches long, have a corporeity about the size of a lead-pencil, are almost transparent, are blind, and are otherwise interesting, but not known to be especially useful. They are found on certain portions of the coast of Florida, but are very rare. Another new fish, which the Chinamen describe as the "porcupine fish," has also been named by Dr. Eigenmann, and he calls it a specimen of the chilmysterus, which is very much different again. The fish is about ten inches long, white below and blue and black above. It is covered with spines like a porcupine. Dr. Eigenmann says this is the first specimen found in the Pacific Coast waters.

OBSERVING THE FORMATION OF HAIL.—A direct observation of hail in the process of formation is recorded by Prof. Tosetti, who, in the afternoon of a squally day, looking eastward through the window of a house in Northern Italy saw the rain which streamed down from the roof to the right caught by a very cold wind from the north and driven back and up in thick drops. Suddenly a south wind blew, and the drops, tossed about in all directions, were transformed into ice-hails. When the south wind ceased, this transformation also ceased, but whenever the south wind recurred the phenomenon was reproduced, and this was observed three or four times in ten minutes.

THE IRON AGE was an age of higher civilization, and merges into the age in which we live. When men commenced to work in iron, every experiment they tried added to its value, and as their knowledge of the metal and its uses increased, they advanced civilization. Warlike as they were, they made knives, axes, helmets and coats-of-mail, but at the same time they made the tools for the field and the utensils for home use—the gentler improvements that were to triumph in the end. They put the true precious metal, iron, daily to new uses, and probably man has not yet found out all the ways in which it can be used.—*St. Nicholas*.

IN THIS AGE OF SCIENCE, the people have an idea that we know so much now there is nothing more to be discovered. Why, we are yet in our infancy as far as electricity goes. New discoveries will yet be made, and we will live to see them put into practical use, which will revolutionize the entire world. The experiment which we are about to make in telegraphy is only a feeler, which will lead to other and more startling experiments. The establishment of telephone communication between the hemispheres is already being seriously discussed.—*Philadelphia Record*.

CLOUD PHOTOGRAPHS.—Many remarkable data of immense value in the preparation of weather forecasts, have lately been secured by cloud photographs. The range of observations extended from clouds floating less than one and one-half miles high in air moving at seven miles an hour, to nine miles above the ground in gales blowing 65 miles an hour, while the surface wind was only a gentle breeze of five miles an hour.

TELEGRAPHY WITHOUT WIRES is said to have been accomplished in England. Mr. Preece, the head electrician of the postal system, succeeded in establishing communications across the Solent to the Isle of Wight, and telegraphed also across the river Severn without wires, merely using earth plates at a sufficient distance apart. It is now proposed to make a practical use of this system in communicating with light-ships.

COLORING MATTER IN COAL.—The amount of coloring matter in a pound of coal is enormous. It will yield enough magenta to color 500 yards of flannel, vermilion for 2560 yards, aniline for 120 yards, and alizarine for 155 yards of Turkey and cloth.

The first telescope was used by Hans Lipperheijn of Holland in 1608.

GOOD HEALTH.

Cancer Making and Cancer Curing.

The people of Berlin have recently been treated to a new horror, which is nothing less than a charge against several of the most prominent medical professors of that city, that they have been engaged in practicing experiments upon patients in the Berlin hospitals to ascertain whether or not cancer can be propagated by injecting cancerous fluid into healthy human tissue! The charge made is in the following words:

"I charge Prof. Eugene Hahn, chief surgeon of the surgical division of the public hospital at Freldehshain, and Prof. Von Bergmann, chief surgeon of the Berlin University, with having overstepped all bounds of their high professional calling and duty by ingrafting on or injecting into the patients under their care, and without the knowledge of the said patients, cancerous embrocations, and in this way artificially producing cancerous disease where it did not before exist."

Some of the German medical men approve of such a practice as experiments in the aid of science. Dr. Paul Gblier, of the Pasteur Institute, has made a study of cancer, and was free to express himself upon the German experiments, as follows: "My opinion is that the conduct of the German professors is culpable in the extreme," he said; "besides, they could show nothing. It has been a well-authenticated fact for years that cancer can be transplanted."

Physicians connected with hospitals in New York say that no such experiments have ever been undertaken in any of those institutions. We hope, for the sake of humanity, that the assertion is correct.

Dr. William M. H. McEwen was of the opinion that cancer was a constitutional disease. That opinion seems to be fast gaining ground among medical practitioners everywhere, and when it becomes general the surgeon will have to lay down his knife and the quack his plaster, for neither can be of any benefit in constitutional treatment.

It will then be in order for the Faculty of this city to cease their foolish cry of quackery and humbuggery against the "San Francisco cancer remedy," which is one of pure constitutional treatment and of undoubted success, notwithstanding the constant reiterations of the doctors to the contrary.

For the information of the thousands who are becoming interested in this discovery, we would remark here that the curative work is going along with increased success and volume. Interest therein is being constantly awakened in new minds and in new quarters. Several physicians are among those who have recently become interested, and three cases are now being watched by them, which have been subjected to microscopic examination, each of which is making rapid progress toward a successful issue—just as rapid as though the microscope had not been invoked to scare the practitioner off the track.

Persistent Opposition Still Maintained.

A petition was recently sent in to the Board of Supervisors asking the Board to request the City Board of Health to investigate this matter. The Board promptly and properly referred the matter to the Hospital Committee, the chairman of which promptly presented the request to the Board of Health; but the latter declined to take any action in the matter! And this notwithstanding the utter and acknowledged inability of the profession to handle the malady with any degree of success! A few more reports like that for the week ending July 25th, which told of the death of eight persons in this city in the week from cancer, will open the eyes of the people to the manner in which the lives of our citizens are being trifled with by the city officials to whom is entrusted all matters pertaining to public health. We have proven by the most indubitable evidence within the reach of a non-professional that cancer of the most decided and difficult character are constantly being cured in this city, many of which cases have come directly from the hands of our best physicians. The persons who have been cured are willing to go upon the stand and testify under oath to the correctness of what we have published. The doors to this treatment are open to all inquirers—professional or otherwise. The treatment will be shown and proven to be constitutional, harmless and without pain. All that is asked for is for physicians to go and see, and if we are imposing upon the public, let them expose us.

Four hundred people are suffering to-day in this city from cancer, which no regular physician pretends to be able to cure, and not one in twenty of which can obtain permanent relief from the knife or caustic. Nineteen out of twenty of those same people would be cured if the physician would advise them to seek relief in the proper quarter and in anything like an early stage of the malady. We are pleading the sense of humanity, and are not striving to advance any private interest. In so doing, we know we have the sympathy and encouragement of some of the best men and women in this city, besides a number of well-known physicians of all the schools. A Board of Health will soon be inaugurated that will do its duty without fear or favor. All we ask is a medical investigation. It is a simple and rea-

sonable request which sooner or later must come. An investigation will open the way for the world to reap the looked-for advantage. Every day that this madloal fraternity of this city delays this inquiry, means the loss of hundreds of valuable lives in this county alone. Is not the possibility of such a great good, which may be so easily determined, worth the effort?

W. B. E.

Koch is at work again on his tuberculin, and hopes to improve it during the next few months, after which he will publish his own report upon it.

A MAN inhales one pint of air at each breath. While standing, the adult respiration is 22 times per minute; while lying down, 13. To save your breath, lie down.

ABOUT 120 Harvard graduates have died since last year's commencement.

USEFUL INFORMATION.

ELECTRIC SAFETY APPARATUS FOR MINERS' CAVES.—At a recent meeting of the Federated Institution of Mining Engineers, London, England, a paper was read describing an electric safety apparatus for miners' caves. It was stated that although great advances had been made in recent years in nearly every branch of mining engineering we were no better off to-day for reliable safety cages than we were 20 years ago. During the past 10 years there had been an average of nearly 10 deaths per annum from the breakage of ropes and chains in shafts. The electrical apparatus in question consisted in the use of the hanging rope as a means of conveying electricity to four electro-magnets on the cage, each of the magnets sustaining a gripping cam. On the fracture of the rope and the consequent breaking of the electric circuit, the cams drop into guides.

AGAINST THE TRUSTS.—By a recent Act of the Illinois Legislature, any combination, contract, or agreement, the tendency of which is to place the management or control of any manufactured product in the hands of trustees, intending to limit or fix the price, or lessen the production or sale of any article of commerce, use, consumption, or manufacture, is made illegal and punishable. The Act is very comprehensive and sweeping in its scope, and if properly administered, will make an end of trusts in that State. The Jeweler's trust has already heeded the warning and dissolved. It is now in order for others to adopt the same tactics, or feel the power of the law. Trusts are at variance with legitimate and honorable business and ought to be wound up, so says an Eastern cotemporary.

THE INCUBATOR KNOWN TO THE EGYPTIANS. The artificial hatching of chickens is by most persons thought to be something new under the sun, and the result of the biological investigations and discoveries made by the evolutionists. The fact is, as Colonel General Cardwell, at Cairo, reports, the hatching of eggs by other than the natural process was known to the ancient Egyptians, and this process, handed down from father to son, leaves our scientific processes for the same purpose far in the rear. The extent of the usefulness among the Egyptians may be gathered from the Colonel General's statement that the even crop of marketable chickens is 15,000,000 each season.

WHY POPCORN WON'T POP.—The question is often asked why popcorn sometimes fails at the critical moment to pop. The trouble is that the corn has either been pulled too green or has become too dry, explains California Fruit Grower. In the former case the skin would be too tender to retain the heated air until the explosion took place, and in the latter case the skin is so brittle that the air escapes without bursting the kernel. If the corn is too dry, which is most frequently the trouble, immerse the unshelled ears half a minute in water and the grains will pop with a delightful exuberance.

IN MINERAL PRODUCTS this country takes first rank. The census shows the production of last year amounted to \$556,998,450, the greatest showing ever reported by any country. The industry gave employment to 512,114 persons, the annual wage amounting to \$12,409,809, the capital invested representing a total of \$1,173,000,000.

TO MAKE FUEL GAS.—Several of the South Side (Pittsburgh) glass companies have decided to put in coal gas producers instead of using solid fuel as they would otherwise be compelled to do next season, the supply of natural gas having been cut off. Among the firms making this move are Imhenn & Co., Phillips & Co., and Cunningham & Co.

A NOVEL INCUBATOR.—A Williamsport (Pa.) man used two pillows, between which he placed eggs, as an incubator, with good results. The pillows were placed in the garret, where they could get the heat of the sun, and 11 out of 12 eggs produced a duckling.

It may not be generally known, but it is a fact nevertheless, that ordinary rubber ink erasers remove rust from polished onlery without injury; try it and be convinced.

ELECTRICITY.

Effects of Electricity on Vegetation.

The application of electricity to agriculture has long been discussed and numerous experiments have been from time to time reported; but it is only within the last few years that these experiments have taken any practical shape.

Experiments by Prof. Lemetrom.

Very extensive experiments have been made by Prof. Selim Lemetrom of the University of Helsingfors. These experiments were continued for a series of years up to 1887, first in Finland, subsequently in France, to demonstrate that the electrical influence is the same whether in cold or warm latitudes. Some of his experiments, however, tended to show that they were seriously interfered with under a scorching sun. The professor's experiments were conducted both upon the potted plants in the hothouse and upon plants in the open field the insulated wires in the latter case being stretched upon poles over the plot of ground, and provided with a point for each square meter of area. The current was supplied by Holtz machines run from 8 to 18 hours daily, the positive pole being connected with the network of wires and the negative with a zinc plate buried in the ground. The electric influence was scarcely perceptible in the growing plants, but was very marked in the yield of many species, especially of barley and wheat, of which the crop was increased by half in some cases. In the hothouse the maturity of strawberries was greatly advanced. The results have shown that plants may be divided into two groups; one, the development of which is favored by electricity, comprising wheat, rye, barley, oats, red and white beets, parsnips, potatoes, celeriac, beans, raspberries, strawberries and leeks; and the other, whose development is more or less interfered with by electricity, including peas, carrots, kohlrabi, rutabagas, turnips, white cabbages and tobacco. The more fertile the soil, and consequently the more vigorous the vegetation, the greater was the excess of the crop under electric influence.

Experiments by N. Specnew.

N. Specnew has made some experiments which have been described as follows: In one series he used seeds of haricot beans and winter and spring rye. The seeds were soaked, electrified and immediately sown. The plants were more developed, their leaves were larger and their color brighter than those grown from non-electrified seed, but their yield was not affected.

In another series of experiments plates of copper and zinc about 2 feet by 2 feet 6 inches were buried at the ends of plots and connected by their upper faces, the effect being to establish a current through the earth. The result was manifested by a larger crop and by the growth of vegetables of enormous dimensions.

In the third series electrical collectors were mounted on insulated rods and connected by wires, the effect being to obtain a highly electrified atmosphere. Seeds of rye, corn, oats, barley, peas, clover, potatoes and flax were used. The form of electro-culture increased the yield of seed an average of one-half, and that of straw one-third, while the ripening was more rapid. It was also found that potatoes grown by electro-culture were rarely diseased, and the beneficial effects of electricity on vines attacked by phylloxera have already been observed. It is possible that a new means is at hand of combating the microscopic pests which attack vegetable growth.

Experiments in Russia.

M. Spehnoff, a Russian agriculturist, is reported to have made a trial of seeds which he electrified for two minutes by means of a current, and repeated the operation ten minutes upon peas, beans, rye, etc., and found that, generally, the electrification of seeds nearly doubled the rapidity of their growth. He then tried to electrify the earth. He took large plates of zinc and copper, 72 centimeters (28 inches) high and 45 (18 inches) wide, which were sunk deep into the ground at the extremity of flat iron bars, and joined them above the ground by an iron wire. The effect of this continuous current is stated to have been prodigious upon vegetables. A radish grew 44 centimeters (17.3 inches) in length, with a diameter of 14 centimeters (5½ inches), and a carrot 27 centimeters (10.6 inches) in diameter weighed three kilograms (6.6 pounds), nor did the excess in size detract from their good quality. The harvest was in all four times superior to the ordinary for roots, and two or three times for plants.

Tender, Succulent Vegetables.

One most important and generally acknowledged fact in growing vegetables is this: Give any vegetable its own time to grow to maturity, and it is invariably tough, stringy, bitter and unpalatable, not fit to eat. The whole aim of the gardener is then to hurry things up, as a quickly grown vegetable is tender, sweet, succulent and delicious, and the market value in direct proportion as these qualities predominate. It is the market value we are after, you know, nothing else. Grown quickly, there are no dead leaves to disfigure the appearance; the plant grows crisp, full of its natural flavor and commands the market and the best prices. A cabbage represents so much money, and money is very pretty. It may reasonably be inferred from these facts that

electricity would greatly aid in giving us tender, succulent vegetables.

Plants under Electric Light.

A beautiful illustration of the effect of electric light on plants was recently given by Dr. Siemens before the Royal Society of England, by placing a pot of budding tulips in the full brightness of the electric light in the meeting-room, and in about 40 minutes the buds had expanded into full bloom. Dr. Siemens stated that he had planted a number of quick-growing seeds, such as mustard, carrots, melons, etc., and having divided the pots into four groups, had one group kept entirely in the dark, one exposed to the influence of the electric light only, one to the influence of daylight only, and one to daylight and electric light in succession. He applied the electric light each evening from 5 to 11 o'clock and left the plants in darkness for the remainder of the night. According to his observations, the plants kept entirely in the dark soon died, those exposed to the electric light only, or to the daylight only, thrived about equally, and those exposed to both day and electric light thrived better than either.

An Interesting Lecture Experiment.

The following experiment was one frequently made in the lecture-room 30 and 40 years ago: Mix a good rich soil with black oxide of manganese in equal parts; moisten with warm water and press the soil inside a coil of insulated wire. Plant mustard seed in the soil and pass a current of electricity through it, using two or more large cells of bluestone (sulphate of copper) battery. As soon as the seeds sprout, the plant will set up a vigorous growth, blossom and produce seed within 36 hours. This is a very pretty experiment to show the wonderful activity which electricity will give to vegetation. The experiment is a very pretty one for school purposes where the class can watch the entire progress of the experiment. If the seeds should be soaked before planting before they commence to sprout, in water through which a current of electricity is caused to pass, the complete transformation from the ripened seed to its numerous progeny, fully developed, may be effected within 36 or 48 hours at the longest.

Salad While You Wait.

In connection with the above, we give, on the authority of a cotemporary, the following novel experiment, which has been devised for the entertainment of dinner parties, and which consists in the serving of salad grown under the eyes of the guests who partake of it. The secret of performing this magic feat lies in soaking good germinating lettuce seed in alcohol for about six hours, and sowing it in an equal mixture of unslaked lime and rich soil. After the soup has been served, sprinkle the seed with lukewarm water, and they will sprout immediately. The lettuce grows to about the size of hazel nuts before the time for serving the salad arrives.

OVERHEAD WIRES.—It will be remembered that some time ago the Board of Supervisors passed a resolution ordering Chief Engineer Scannell of the fire department to remove the overhead wires; and that in future all telegraph and telephone wires would have to be laid under the ground. Before the chief could proceed with his work, the Electric Improvement Company applied for and secured a temporary injunction restraining Scannell from carrying out the order of the Supervisors, and also against the city from proceeding with the work. Suit was brought to enjoin the injunction and both the defendants demurred. The court on Monday enjoined the demurrer and dismissed the case. In future, wires will have to be placed underground in this city.

FREIGHT ON ORE.—S. P. Blade of Dagget, San Bernardino Co., writes as follows: "Your editorial on Freight on Ore is good. The idea should be carried out so that ore can be benefited in San Francisco as cheaply as in Pueblo. Freight rates should not be above one cent per ton per mile on 60-ounce ore. Down here everything should be booming instead of idle. There are plenty of gold, silver and lead mines, but capital is slow to take hold of even developed ones. The English are far ahead of our own people in this, as when they see a good property they are ready to pay what it is worth and work it."

WHY IT TURNED BLACK.—Some new belting was kept running for only four hours at Owens College during the late weather. It was new and bright when started; when stopped it was black and loaded with dirt. It had been running at 4000 feet an hour. Professor Reynolds points out the analogy to the dirtiness of an express train, the phenomenon in both cases being due to the fact that the rapidly moving body comes in contact with a greater quantity of air in a given time than a stationary body, and therefore picks up a greater quantity of atmospheric pollution.—*Mechanical World.*

ONE of the longest and most costly steel railroad bridges in the country is now being erected by the Union Pacific across the Columbia river at Vancouver, Wash. The length from the Washington to the Oregon shore will be 6000 feet, and the draw pier will be over 400 feet long. The cost of the structure will be over \$4,000,000.

TABLE OF CONTENTS.

EDITORIALS.—Pulverizing Ore; Quarrying Gold Ore, 81. Passing Events; No Government Bonus; Metallurgy of Gold; The Gold Belt of California; Marine Engines; Mineral and Agricultural Lands, 88. Gas-Fired Furnaces; Locating Claims and Assaying Ores, 83.

ILLUSTRATIONS.—The Dodge Pulverizer; The Treadwell Mine, Alaska, 81. The Pietzka Puddling-Furnace, 89.

CORRESPONDENCE.—Tuolumne County Mines, 82.

MISCELLANEOUS.—An Increasing Demand for Graphite; Will Erect a Smelter; Mineral Wealth of the Salton Sea; Spencerillo Paint; Seemless Gold Tubing; The Geological Survey; A Prehistoric Tusk; Nevada Iron Ore, 82. The Prescription of Metals from Hypophosphite Solution; The American Flag; Bed of Pipe Clay; New Well Boring Hydraulic Pump; Dry Kilns; Cosmic Dust; A Flexible Sandstone, 83.

MECHANICAL PROGRESS.—Modern Inventive Activity; A Wonderful Mechanical Process; Wooden Joists versus Iron for Buildings; Monster Gun; Aluminum Coming into Use; Pipe Direct from Bar Iron; The Core Saw; The Twisted Wire Nail; An American Blast Furnace; Alloy in Coins; The Largest Gun, 86.

SCIENTIFIC PROGRESS.—Science in Society; The Tide; New Fishes; Seeing the Formation of Hair; The Iron Age; Cloud Photographs; Telegraphy Without Wires; Coloring Matter in Coal, 86.

GOOD HEALTH.—Cancer Making and Cancer Curing, 87.

USEFUL INFORMATION.—Electric Safety Apparatus for Miners' Cages; Against the Trusts; The Incubator Known to the Egyptians; Why Popcorn Don't Pop; To Make Fuel Gas; A Novel Incubator; Miscellaneous, 87.

ELECTRICITY.—Effects of Electricity on Vegetation; Overhead Wires; Freight on Ore; Why It Turned Black, 87.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 84-85.

MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 92.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 92.

Business Announcements.

Passing Events.

The Pine Nut mining excitement in Nevada still continues, and many miners are on the ground. Little active work has yet been done, so no one can tell much of the permanency of the veins. Many prospectors are, however, investigating the region.

The big antimony mine at Big Creek near Austin, Nev., has obtained rates from the railroad so that it now ships its ore for reduction in this city. The ore is low grade and will not bear high freight rates.

The marble quarry near Columbia, Tuolumne county, has passed into the hands of English capitalists, who will properly open it. The English and French capitalists are showing more faith in our mining industry in this State, than are our own people.

The record-breaking feat of the steamship Majestic this week is a notable one for marine engineers, the steady, regular, high speed being due to the perfect working of the splendid machinery with which the vessel is fitted.

The Idaho Mining Company of Grass Valley has declared its 256th dividend, at the rate of \$3 per share. The aggregate of the dividend is \$9300.

No Government Bonus.

There are many persons who believe that the U. S. Government stands ready to pay a bonus of \$20,000 or \$25,000 to the discoverer of a tin mine in this country. There are many more who believe that the Government will pay \$100,000 to the inventor of a perpetual motion machine.

Both these ideas are fallacious. No bonus has been offered in either instance, nor is there likely to be. As for tin, there is one tin mine in operation in this State, turning out marketable tin. In South Dakota, one company alone owns 1100 tin-ore claims, more or less developed. Had there been a bonus offered, it would have been collected long ago.

Now, in the case of perpetual motion machines, the Government actually discourages inventors instead of encouraging them. The U. S. Patent Office was formerly bothered constantly by applications for patents on impracticable inventions in this line. The examiners were given great trouble and the inventors themselves were led to expend both time and money on pieces of absolutely worthless mechanism.

The inventors were of course acting in good faith as far as they were concerned, but in most cases they were ignorant of the principles and inexperienced in the details of mechanism, producing machines sometimes of marvelous complication, but of no practical utility. It was a deed of charity to this class of men to prevent them expending their money and that of their credulous friends. It is very rarely that any one skilled in machinery attempts to design anything in the line of "perpetual motion," the inventions in this direction coming mainly from men in other walks of life.

Some time since, the Patent Office adopted a rule which has had the effect of discouraging the production of perpetual-motion machines. When an application for a patent on one of these is received, a circular is sent to the inventor informing him that no examination of his patent papers will be made until he forwards a working model of the invention. This ends it, of course, as none of them have any working model. They have only crude drawings. When they make a model, and it is found not to work, it is not forwarded. So it will be seen that the U. S. Government is not so anxious to have a perpetual-motion machine as to offer any bonus for it.

Metallurgy of Gold.

The "Metallurgy of Gold" by M. Eisler, formerly of this city, is a practical treatise on the metallurgical treatment of gold-bearing ores, including processes of concentration and chlorination and the assaying, melting and refining of gold. This edition contains 187 illustrations in its 524 pages. The treatment of gold-bearing ores, although at one time so uncertain in its results as to be not only a hazardous, but almost a purely speculative, business, has now, through continued improvements in appliances and the adoption of more economical methods, developed into a settled industry, in which more or less profitable results are obtained even from comparatively low-grade ores. An idea of the scope of this book will be gained from the titles of the principal chapters. After the introductory one, mainly relating to the gold-mining in California, hydraulic mining, etc., the next two chapters are on crushing and amalgamation.

Then follow chapters on milling machines, concentration, rebellious ores, roasting of pyritic ores, hydro-metallurgy of auriferous ores, chlorination, electro-metallurgy, smelting of pyritic ores, cupelling, parting and refining of gold bullion, melting and assaying of gold, chemical examination of gold ores, geological features of gold-producing countries, etc.

The work is quite comprehensive and a useful one. It is written from an English standpoint, so to speak, but California practice is constantly quoted, most of the machines figured are also those in use in this State. From the nature of the work, it is one largely of compilation, but the author has contrived to get almost every thing of interest. The book is published by Crosby, Lockwood & Son, 7 Stationers Hall Court, Ludgate Hill, London. We can supply the book, to those who may order it, for \$3.50 per copy.

The Gold Belt of California.

Dr. G. F. Becker, geologist in charge of the California party of the U. S. Geological Survey, has been on a tour of inspection among the three surveying parties now at work in the field. As stated elsewhere in this issue, the work is mainly on the gold belt of California, as it has been for several years. The investigations are being conducted from the crest of the Sierras down to the great valley, from the Yosemite to Quincy, Plumas county, embracing an area of some 16,000 square miles between parallels 37½ and 40. One party has been in Plumas and Butte counties, one in Nevada county, and one in Amador. Topographical and geological maps of the auriferous gravels of the State are being prepared, which will be published with the results of the investigations as to conditions under which miners may expect to find gold gravel. It will take two more seasons to complete the work in the region referred to, and then work will be commenced in the southern part of the State. Seven sheets of the map above alluded to will be ready for the printer by the end of this year.

Among other things, Dr. Becker says: "We have made no extraordinary discoveries, but I have satisfied myself that the gold-bearing mines of California have not begun to be exhausted. There are very many profitable quartz mines in the State, and I hardly need to say there are innumerable gravel mines which could produce all the way from \$5000 to \$500,000 annually, and the owners of which are debarred from operating them by hydraulic mining. In Butte county alone I found 250 hydraulic mines, to prevent whose operation, injunctions had been served on the owners. To this may be ascribed the so-called decadence of gold-mining in California."

As these injunctions referred to are from United States courts, and the Government has practically stopped gravel mining on the hydraulic system, it seems odd for the same Government to be conducting surveys and making maps of the auriferous gravel deposits, and getting ready to tell miners how to find them. The miners would really prefer to be told some way to work the gravel they have, than be told where and how to find new deposits which they cannot work when found. But then one branch of the Government seldom knows what another is doing. The Geological Survey is going ahead with its work among the auriferous gravels and ignoring the fact that the best system of working them is tabooed by the courts. The survey people probably recognize the fact that the better judgment of future generations, free from prejudice, will find some way by which these deposits of gold can be utilized to a profit. When that time comes, then work among the gravels will have practical results and be valuable to the mining community. As to the cause of the decadence of gold mining in California, Dr. Becker states a now recognized fact.

Marine Engines.

The record of speed across the Atlantic has again been broken, this time by the White Star steamship Majestic, which has made the trip from Queenstown to Sandy Hook in 5 days, 18 hours and 8 minutes. The best previous record was that of the City of Paris in 5 days, 19 hours and 18 minutes in the year 1889. The highest run was 501 miles in 24 hours. The Inman liner City of Paris, in her August voyage, 1889, traveled 2788 miles in 8358 minutes. The Majestic traveled 2777 miles in 8288 minutes. In point of time, the Majestic is 70 minutes ahead. In average speed, the City of Paris traveled the nautical mile in 2.998 minutes, while the Majestic covered the mile in 2.948 minutes. She was .9 of a second faster. The Majestic averaged 20.104 knots an hour.

One feature of the passage of the City of Paris is still unequalled. On August 25, 1889, she covered 502 knots, on August 26th 506 knots, on August 27th 509 knots. This is the Majestic's seventh passage. When she first came she was beaten by the City of New York. Chief Engineer Sewell, in speaking of his engines, said that they could be made to do a little better yet. They had developed 19,500 horse power, giving the wheels an average of 78 revolutions a minute, with a consumption of 220 tons of coal a day—a marvelously small amount of coal. He said the

engines were good for 20,000 horse power. On the first day of the recent trip he remarked that the engines were working as smoothly as the wheels of a chronometer.

The progress in marine engineering of late years has been remarkable, and has been steady. The marine engine of to-day is about the perfection of giant mechanism. The enormous bulk of the hulls they drive at such great speed makes their operation still more wonderful. These big steamers now run steadily over 20 knots an hour. On smaller vessels still greater speed is attained, some of Herreshoff's models, equipped with his boilers and engines, having run as high as 26 and 27 knots. This skilled designer predicts a speed of 35 miles an hour in steam vessels in a few years.

Mineral and Agricultural Lands.

Acting Secretary Chandler has rendered a decision in the case of Harlish against Wallace on appeal from the finding of the local land officers at Sacramento, Cal., which will materially change the practice of the Department as to agricultural entries which are subsequently found to be mineral in character. The acting Secretary holds that, in order to defeat agricultural entry on the ground of mineral character of land, it must be shown that the mineral was known to exist at the time of entry. Heretofore the practice has been to cancel agricultural entries where mineral was discovered at any time prior to issuance of patent.

This seems to be one more link in the chain which is drawn across the way to prevent the miners proving lands are in the mineral domain instead of the agricultural. It is becoming easier and easier to get at mineral lands for so-called agricultural purposes. As has been repeatedly stated, the agricultural claimant, presumably ignorant of the mineral character of land, has only to swear that he knows of no mineral. Several others equally ignorant swear the same. Then, when publication comes, some mining man says the land is mineral in character, and if he can prove it, the agricultural claimant is thrown out.

But under this ruling, being able to prove it before patent issues, will not do; he must prove that he knew of mineral before the entry was made. The agricultural claimants' knowledge is negative, and the mineral man cannot be positive without examination; and the examination avails nothing if the entry has been made, as it attracted no attention until the entry was made, the agricultural man has the best of it.

It is under just this kind of conditions that the domain open to the prospector is becoming gradually narrowed. The law never contemplated such a state of affairs. It wanted agriculturists to pay for agricultural land and miners to pay for mineral land. The prices are on a different basis; but when an agriculturist gets hold of a lot of land containing minerals, and patents it, the minerals belong to him as well as the land.

Up in Shasta county and throughout the miners have had to hand together and go about proving the mineral character of large tracts, to prevent the land being taken up by agriculturists. In other parts of the State, where the miners have no direct counter interest, parcels of mineral land are constantly being taken up by agricultural claimants. This is being systematically done in many counties, and the rulings of the department seem to favor instead of prevent the custom. This last ruling seems to us to be a very bad one indeed. The miners ought to be allowed to prove mineral character at any time before patent issues. If the Government really wanted the facts in such case, it would be very easy to get them. The new practice is bad for the mining industry and an aid to fraudulent entries.

The Standard Consolidated Mining Company has received a hullion shipment valued at \$23,327.24, being the product of the mine for the month of July. The company has about 60 men on its pay-roll, and is doing much work in the mine, which is looking well. Last week 321 tons of ore were crushed at the mill. The average battery assay was \$16.66 per ton.

WELLS, FARGO & Co. are about to give up their banking department in Virginia City, and in future do nothing but an express business.

Gas-Fired Furnaces.

Wrought-iron is produced in Germany by puddling exclusively, and almost invariably, by that variety of the puddling process which

position has been reached, when they are lowered into place, and the connection is again complete. The Pietzka furnace at Zawadzky, holding a charge of 500 kilos, produced by direct firing, 6280 kilos; by gas-firing, 6674 kilos

This record is especially favorable, since, deducting the amount of coal burned for the steam-power required in the operation of the furnace, it shows 28 to 29 kilos of coal used in puddling proper, while if all the gas were used

Locating Claims and Assaying Ores.

EDITORS PRESS:—Will you kindly answer me the following questions if possible, as no one here can: (1) Five men locate four claims and write out one notice claiming 6000 feet. They survey and record the same as partners on one notice and name it the 'Juniper Point.' Can we hold the claims that way, or will we have to record separately each claim? (2) Can you tell me where I can get a copy of 'The Explorers, Miners and Metallurgists' Companion,' by J. S. Phillips, M. E., and what is the price? (3) Do you assay ores; if so, what are your terms for assaying for what is in the rock? (4) Does the U. S. Mint of Philadelphia, Pa., do assaying? (5) What is the Government bonus for finding a good tin mine, and to whom do you apply to get it? J. H. L. Paisley, Luke Co., Or.

(1.) It is impossible for any man or set of men to locate and hold by one original location, 6000 feet of ground. It would be contrary to law. The law expressly says: "A mining claim located after the 10th day of May 1872, whether located by one or more persons, may equal, but shall not exceed, 1500 feet in length along the lode."

The Land Office Regulations on the subject, are as follows: "From and after the 10th of May 1872, any person who is a citizen of the United States, or who has declared his intention to become a citizen, may locate, record, and hold a mining claim of 1500 linear feet along the course of any mineral vein or lode subject to location; or an association of persons severally qualified as above, may make a joint location of such claim of 1500 feet, but in no event can a location of a vein or lode made subsequent to May 10th, 1872, exceed 1500 feet along the course thereof, whatever may be the number of persons composing the association."

The language of both the law and the regulations is plain and explicit on the point in question, and no such location as that stated would stand in law. It would be impossible to obtain a patent on the claim under the circumstances, as the law recognizes no location of over 1500 feet. Of course four men could each locate a separate 1500 feet, and record separate claims, and afterward the claims might be consolidated, but the original locations, record, etc., would have to be separate for each 1500 feet, to be legal. The language of the law is so plain in this matter that there can be no mistaking it.

(2.) J. S. Phillips, the author of the "Explorers' Miners' and Metallurgists' Companion," died some years ago. His book is for sale at this office; price, post paid, \$6.

(3.) No, we do not assay ores, leaving that to those who make a special business of it. In our advertising columns will be found the names of men competent to do any work of that kind.

(4.) The U. S. Mint at Philadelphia and the branch Mint here make bullion assays, but neither is in the business of making ore assays for private individuals. The ore assay is what the miner usually wants, and the assaying firms make these. The miner has no need of a bullion assay, while he gets bullion from his ore.

(5.) You apply to no one for the Government bonus for a good tin mine for the simple reason that the Government does not offer a bonus for a tin mine, and never did. And even if it did, the bonus would have been long since collected. This subject is referred to more at length in another article in this issue of the Press.

W. R. ECKART, Consulting Engineer of the Comstock Pumping Association, says that the prospects for the drainage of the lower levels of the Gold Hill mines continue favorable. Just now progress is slow. Mr. Eckart says that he had a conversation with John W. Mackay shortly before that gentleman's departure for the Comstock, in which Mr. Mackay said he was greatly interested in the drainage proposition, and that he would investigate it while upon the lode, with a view to resuming pumping at other points, if he thought it feasible.

The antimony mine on Big creek, south of Austin, Nev., will in future ship ore to Starr & Matheson in this city, instead of to Swansea, Wales, arrangements having been made for better ore rates. This deposit is a very extensive one, but at present low prices, they do not employ many men.

A New wave-power motor is being put up at Point Lohoa to pump water to a height where its fall may be utilized to generate electricity.

PIETZKA PUDDLING-FURNACE—LONGITUDINAL SECTION ON A B D.

PIETZKA FURNACE—CROSS-SECTION ON L M.

depends upon the air for oxidation. The other variety, in which oxidation is effected by means of a fetling of ore, and which is so common in America, finds in Germany a very subordinate application only. The essential improvements in puddling have been mainly in the more complete utilization of fuel by means of gas-firing and double furnaces. One of the two furnace designs specially mentioned in this connection by Dr. Herman Wedding (before the American Institute of Mining Engineers) is the Pietzka furnace, with constant direction of flame and reversible hearth. The latest form of this, as seen at Zawadzky, in Upper Silesia, is shown in the cuts.

There the flame maintains one direction, yet the hottest flame always strikes the hearth in which puddling is going on. The peculiarity of this construction is that both hearths are carried on a hydraulic piston which stands underneath between them. The connections between the side-walls and fixed fire chamber or flue are made with inclined conical surfaces.

The hydraulic piston lifts the hearths a little before turning them; and hence they turn freely and without friction until the reversed

of muck-bar, as the average per shift—in single weeks, however—an average of 10,000 kilos of muck-bar, with a coal consumption per 100, of 66 kilos, with direct firing, and 42 kilos, with gas firing. The escaping gases were here utilized further in the production of steam.

to heat the generators, this figure would be further reduced to 20 to 25 kilos.

A TOTAL of \$200,650 was disbursed in wages to employees of the Comstock mines and mills for the month of July.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

ARIZONA MINES.

NOTE.—Holmes has unsold bullion amounting to \$851 ounces; Con. Cal. and Va., \$35,663.16 coin in Virginia City, and unsold bullion, \$37,857.43, and further shipments to arrive; Navajo has \$12,800 due on pumping account.

TRAVEL COMFORTABLY.
FOR COMFORT take the Union Pacific Railway. THROUGH PULLMAN PALACE SLEEPING CARS, San Francisco to Chicago WITHOUT CHANGE, with DINING CARS the ENTIRE DISTANCE. Tourist excursions leave every Tuesday and Saturday, with through Pullman Tourist Sleeping Cars to Chicago, without change. Reclining Chair Cars are also run on excursion trains. Passengers going via the Union Pacific Railway arrive in Chicago 22 HOURS IN ADVANCE of all trans-Continental lines. D. W. HITCHCOCK, General Agent, No. 1 Montgomery St., San Francisco.

Copied from the Morning Call.

Editor Morning Call.—DEAR SIR: In the interest of suffering humanity, and trusting that a knowledge of my wonderful cure may be of benefit to the public, I address you. About four years ago, while suffering with neuralgia, my eye became inflamed and had to be removed. A cataract began to form on my right eye about the same period. I consulted Dr. Farrar and other eminent oculists, and they all informed me that they could do nothing to relieve me, alleging as the cause that the cataract was not ripe, and could not be operated on until I went totally blind.

On the 5th of January last, being almost totally blind, some friends of mine recommended me to try Dr. Robert J. La Grange, the eye, ear and throat specialist of 215 Powell street, this city. At last I was prevailed upon, and I consulted the doctor, although I was skeptical at first as to his treatment from the consultations I had held with other surgeons. I was totally blind, however, and felt that if his treatment would do no good it could do no harm. Inside a week my daughter remarked how wide I could open my eyelids, which had become paralyzed. Under his treatment the muscles had been strengthened. The treatment is very simple and absolutely painless. No cutting and no operations; simply using a salve on the eyelid and leaving it on a short time each day, and then bathing in warm water. The salve has the effect to scatter and disperse the cataract, and thus the vision is gradually restored. The doctor scouted the idea of waiting until you became blind, and says the sooner the treatment is started the easier it will be to remove the evil. I began to improve at once and each day found myself some better until now I can see well, and the doctor expects that in a few months more my sight will be completely restored. In justice to the doctor and to those that are afflicted, I feel it my duty to let the public know of this great boon and the man to whom I am indebted for my restoration to sight. Had I taken the remedy at once I would have been cured in a very short time, instead of waiting and losing nearly four years of valuable time going blind. In the course of a conversation with Mr. Boyd of Front street, whose eye had been operated on under the old method, we both made test of our eyes and my sight was better than his, and while under the old method his will never be any better than at the present, mine is daily improving. Thanking you for your valuable space, I am yours, etc., WALTER W. MOSES, 35 Perry street, San Francisco.

NOTE.—As the system of treatment mentioned above is entirely new and of recent discovery by Dr. La Grange this letter is of vital importance to the public. Mr. Moses is a member of several fraternal societies in this city, the members of which are aware of the condition of his sight before he began treating with Dr. La Grange and his improved state at the present time.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Testing and Working Silver Ores

A VALUABLE BOOK

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," are found paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride of ammonia, Fatchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titide Smelting, Mexican process, Chilean process, Kroeckhke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, greens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Nolce's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by DEWEY & Co., Publishers, 220 Market St.

AMERICAN MINING AND STOCK CODE

"KELLOGGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work is strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, \$5. Forwarded postpaid on receipt of price by

DEWEY & CO.,

NEWSPAPER AGENTS WANTED.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference. Special inducements to old agents.

DEWEY & Co., Publishers,
No. 220 Market St., S. F.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1
Second Edition.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Churning; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scoriafication; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth 1339. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II and III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zinckite; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75 Sold by DEWEY & Co., Publishers, No. 220 Market St., S. F.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$3.00 post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocke, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formula as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

BACK FILE of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working Gravel, Cement, Clay, etc. It avoids crushing the rocks which are washed clean and at the same time pulverizes the Cement or Clay and SAVES EVEN FLOUR GOLD.

It is only necessary to have about six inches of water to work 100 tons or over per day. Full particulars given by addressing:

VALLEY SPRING, CALAVERAS CO., CAL., July 19, 1890.

MR. S. K. SNODGRASS.—Dear Sir: We find your machine perfectly reliable for four to five tons per hour, according to size of gravel. The work is well done, and not to exceed five per cent gets by, which I believe is very close work for any machine. Yours, L. A. SHEAD.

S. K. SNODGRASS, 220 Sutter Street, San Francisco.

WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

More than DOUBLE THE CAPACITY with One-Half Less Power and Occupying Less than One-half the Space of any other Concentrator.

Built of Best Steel and Wrought Iron. STRONG AND DURABLE. Price, \$575 f. o. b. Sent for Catalogue and Testimonial.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectively prevents the edges from cracking; plain edges have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates this difficulty.

PATENTED Aug. 19, 1890.

GEO. E. WOODBURY, Man'r, 213 to 219 First St., San Francisco.

— THE —
JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

THE BEST FORM OF FEEDER EVER DEvised,

And pronounced by reputable mining men to be far superior to any other, as the fact that over 3000 have been placed in successful operation fully demonstrates.

WE ARE ALSO MANUFACTURERS OF THE

"STANFORD," "TULLOCK" AND "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

ENDLESS GANDY THRESHER BELTS.
BEST IN THE WORLD.

HINOKLEY, SPIERS & HAYES, Proprietors.
(ESTABLISHED IN 1855.)
Office, 213 Fremont St., San Francisco.
—MANUFACTURERS OF—

TUSTIN'S PULVERIZER.

ENGINES AND BOILERS
OF ALL KINDS,

Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries.
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:
Corlies Engines and Tustin Ore Pulverizers.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

FRISBEE-LUCOP MILL CO.,
—MANUFACTURERS OF—
Centrifugal Roller Steel Mills,

FOR PULVERIZING ORES, WET OR DRY,
For Amalgamation or Concentration, and for Manufacture of Cement, Fertilizers, Paint and all other purposes for which grinding or pulverizing is required.

Send for Catalogue and Price List to
FRISBEE-LUCOP MILL CO.,
145 BROADWAY, NEW YORK.

THE GIANT POWDER COMPANY,
—PATENT OWNERS OF—
NOBEL'S DYNAMITE, NOBEL'S EXPLOSIVE GELATINE, NOBEL'S GELATINE-DYNAMITE, AND THE JUDSON IMPROVED POWDER.
Best and Strongest Explosives in the World.

JUDSON POWDER.
The only Reliable and Efficient Powder for Mump and Bank Blasting. Railroad Contractors and Farmers use no other. As others IMITATE our Giant Powder, so do they Judson, by manufacturing an inferior article.

BLACK POWDER.
The Giant Powder Co. having built Black Powder Works, with all the latest improvements, at Olipier Gap, Placer County, known as THE CLIPPER MILLS, offer this powder and guarantee it the best.
CAPS and FUSE at Lowest Rates.

THE GIANT POWDER COMPANY, 30 California St., San Francisco.

DEWEY & CO. { 220 MARKET ST., S. F. } PATENT AGENTS.
Elevator, 12 Front.

Iron and Machine Works.

CALIFORNIA MACHINE WORKS,
WM. H. BIRCH & CO.,
ENGINEERS AND MACHINISTS,
No. 119 Beale St., San Francisco.

—BUILDERS OF—
Steam Engines, Saw Mills, Mining Machinery, Dredging Machines, Rock Crushers, Cable Railway Machinery, Elliotts Air Brake Co.'s Patent Steam and Hydraulic Elevators, Air Cushions and Air Brakes, POSITIVE SAFETIES, Improved Ram Elevators, Sidewalk and Hand Hoists, B. E. Henricksen's Patent Automatic Safety Catches.
Machines of all kinds Made and Repaired.
Orders Solicited.

UNION IRON WORKS,
SACRAMENTO, CAL.

ROOT, NEILSON & CO.,
MANUFACTURERS OF
Steam Engines, Boilers,
AND ALL KINDS OF

MACHINERY FOR MINING PURPOSES.
Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.
Front St., bet. N & O Sts., Sacramento, Cal.

THOMPSON BROTHERS, EUREKA FOUNDRY
—Manufacturers of—
CASTINGS OF EVERY DESCRIPTION
127, 129 and 131 Beale Street,
Between Mission and Howard, SAN FRANCISCO.
GAS WORK A SPECIALTY.

MINING ENGINEERS.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories, and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHES, ASSAYS AND ANALYSIS OF ORES, WATERS, OREOK, SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. William E. Everette** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

A. S. GRANT, S. B. CONNOR.
CONNOR & GRANT,
Millwrights and Engineers
303 CALIFORNIA STREET,
Rooms 30 and 31, SAN FRANCISCO, CAL.

Designers and Constructors of Gold and Silver Mills, Hoisting and Pumping Works, Tramways, and everything pertaining to the Mining and Reduction of Ores.

ROSS E. BROWNE,
Mining and Hydraulic Engineer,
No. 307 SANBOME ST., SAN FRANCISCO.

THE LAW OF MINES

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO., Springfield, Ohio, or 110 Liberty St., New York. **FRASER & CHALMERS, General Agents,** Chicago, Ill., and Denver, Col. **PARKE & LACY CO., General Agents,** San Francisco, Cal.

KROGH'S MINING HORSE-POWER HOIST

Is known to be the Best Horse-Power Hoist now made. It is strong and durable. The drum will carry 1000 feet of five-eighths steel rope. It can be used to run a pump or blower, in conjunction with hoisting. Manufactured by **F. W. Krogh & Co.,** 51 BEALE ST., San Francisco.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable. Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

BURNHAM, WILLIAMS & CO., Proprietors, Philadelphia, Pa.

CLAYTON IMPROVED MINING PUMPS

THOMAS PRICE & SON,

Assay Office, Chemical Laboratory,

BULLION ROOMS and ORE FLOORS,

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.

SELBY SMELTING and LEAD CO., 416 Montgomery St., San Francisco

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, Etc., Etc.

Standard Shot-Gun Cartridges, Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN **ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,**

LSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals. Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Agents for the Morgan Crucible Co., Battersea, England. Also for E. G. Dennison's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 28 STEVENSON STREET, Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1890

Ores worked by any Process. Ores Sampled. Assaying in all its Branches. Analyses of Ores, Minerals, Waters, etc. Working Tests (practical) Made. Plans and Specifications furnished for the most suitable Process for Working Ores. Special attention paid to Examinations Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO., (Formerly Huhn & Luckhardt, Mining Engineers and Metallurgists)

GREAT REDUCTION! BATTERY SCREENS.

Best and Cheapest in America.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot Cut or burred and Slot Punched Screens. Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice, 611 & 613 Front St., San Francisco, Cal.

INVENTORS, TAKE NOTICE! **L. PETERSON, MODEL MAKER.**

258 Market St., N. E. cor. Front (up stairs), San Francisco. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 6, 1891

General trade shows signs of improving, with the buying apparently of an assortment character. Iron workers are generally busy, with orders in several cases well ahead. The season so far has been favorable to them owing to the lower cost of fuel and iron. The money market is very easy, considering the very heavy crops that are being marketed.

QUICKSILVER—Receipts the past week aggregate 273 flasks. The lessening output of the Almaden mine is having a more favorable influence on the market, which might soon to bring about better prices.

MEXICAN DOLLARS—Under continued light demands, the market does not show any appreciation in prices—last week's quotations holding good for this week's issue.

SILVER—In London higher prices were reached the past week than at any time since the high figures reached last year. In New York, market prices have hung around \$1.00. It is the prevailing opinion that the Government's purchases for this month will be made at an earlier date than they were in the preceding month. All advices received from the East point to a certainty that one of the first acts of the 52d Congress will be to pass a free-coinage bill, and it is given out semi-officially that President Harrison will sign a bill of this character. This, if true, is a long step in the right direction, and which when taken, will take out of politics the cry for more circulating currency. The writer is inclined to believe that the President will sign a free-coinage bill, even if not in accord personally with such a measure, in deference to the wishes of a vast majority of the people of the United States. With this country returned to bimetalism, there can be no question but European Governments will soon be forced into line.

LIME—Receipts the past week aggregate 3821 bbls. There is a continued free movement both for home and for Hawaii.

BORAX—Receipts the past week aggregate 230 cts. The market is reported essentially unchanged.

LEAD—A higher range of prices coming through from New York indicate that smaller holders have sold out, and that buyers' necessities compel them to pay large holders' advanced views. The consumption is said to be enlarging.

TIN—The market is quiet but firm for plate. In pig trading is light, with supplies on spot and to arrive reported to be in excess of the demand. Foreign advices report pig lower and weak at the decline.

COPPER—The market continues to ease off. It now looks as if lower prices may be reached, before any degree of stability manifests itself, than at any time since the disastrous French syndicate deal, yet this appearance may be fictitious, made so as to allow the concentration by a pool or syndicate of all available supplies for another deal. This opinion is strengthened by advices from England, reporting that all offerings are being absorbed at the declining prices.

IRON—Liberal spot supplies and heavy near by deliveries have had their natural effect, and under some cutting the market is lower. At the lower prices larger quantities will go into consumption.

COKE—The market is weak with concessions reported obtainable.

COAL—Receipts the past week aggregate as follows: Nantam, 1083 tons; Sydney, 1500; Departure Bay, 1500; Coos Bay, 700; Comox, 4700. Total, 9443 tons. Light receipts and a steadily increasing consumptive demand create a stronger market. Capt. Wilson, a large and prominent dealer claims that everything now points to a higher range of prices before the close of the present month. Australian advices report more vessels up for this port and after about a fortnight's time ships are again clearing with cargoes.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

- FOR THE WEEK ENDING, July 28, 1891.
- 456,715.—SASH BALANCE—W. Berry, Angel Island, Cal.
- 456,716.—SASH BALANCE—W. Berry, Angel Island, Cal.
- 456,877.—EAVES' TROUGH HANGER—M. Bingham, Shelton, Wash.
- 456,583.—HYDROCARBON BURNER—Blasdel & Morse, Los Angeles, Cal.
- 456,885.—REVERSING VALVE—H. T. Clarke, Portland, Cal.
- 456,720.—FISHING BOAT ATTACHMENT—Pedro Costa, S. F.
- 456,618.—KNIFE SHARPENER—A. Fritsch, Suisun, Cal.
- 456,818.—RAILWAY—W. S. Herrington, S. F.
- 456,623.—ROLLER QUARTZ MILL—C. C. Lane, San Diego, Cal.
- 456,830.—MACHINE WRENCH—M. Martin, Walla Walla, Wash.
- 456,870.—SCISSORS—N. A. Wheeler, Alpona, Wash.

The following brief list, by telegraph, for August 4th, will appear more complete upon receipt of mail advices: California—Owens C. Amegotti, San Francisco, holder for articles of table ware; Samuel H. Benson, San Francisco, steam boiler; Charles Cummings, Oakland, apparatus for transmitting power by means of compressed air; Charles Cummings, Oakland, rock drill; Alfred Dudden, San Francisco, pneumatic door check; Samuel N. Goldy, San Francisco, sash balance; Gilbert Tompkins, San Leandro, adjustable shoe weight for horses; Robert Vint and L. Goldberg, San Francisco; cigar stand and holder; Dornier Walsh, assignor of one-half to W. J. Davis, San Francisco, game apparatus; William E. Weldon, San Francisco, vaginal syringe; John S. Woolsey, San Jose, lawn sprinkler.

Oregon—Richard Clinton, Portland, car coupling; David H. Gotshall and H. Petit, Astoria, neckyoke.

Washington—Charles T. Anderson, Tampico, haling press; Michael E. Reilly, Monte Sano, window sash.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

Comstock mining shares the past week did not make any startling, erratic moves, but gradually gained strength with slight fluctuations in the north end and middle group's shares. The first time for years Potosi sold higher the past week than did Cop. Virginia. What caused the advance is as yet a mystery. Some say it was by cross orders to make the short fills; others think that the management is preparing to show up the ore on which they made the little deal in 1890, while others, again, think it a bluff to sell out stock for the usual winter assessment hatching. As far as this is concerned, the movement along the entire line looks very much like an assessment deal, but to make it successful so as to more easily catch gudgeons, ore will have to be shown in an unexpected quarter, and this showing must or should be assisted by better bullion returns from other ore-producing mines. This, it is said, can be done by a little reformatory work in milling ore, for, as ore is milled, mining men say that which goes over \$60 and \$80 a ton is made to mill only from \$15 to \$25 a ton, the balance going to reported inside rings.

Outside mining shares are lifeless. A subscriber wishes to know why in mentioning coppers, we neglected to state about those who profess by some kind of mystical figures (a book of reported sales, prices, etc., being kept for the purpose), to be able to call the turns in the market. These creatures were not mentioned for the reason that we thought no person so credulous as to believe what is claimed, for if they do, they, in the end, will be knocked financially, higher than the proverbial "Gilroy kite."

News from the Comstock mines is of quite an interesting character. Col. Mackay is in charge of the North End mines and may possibly run into some of the high-grade ore reported by Senator Fair about 13 years ago. Much stress is placed on the 1100-foot level south drift in Con. Virginia. Sen-

ator Fair reported that on the 1400 level running south the ore was low grade, but running north it was high grade. Is it not reasonable to conclude that the same conditions obtain on the 1100-foot level? The Overman management is reticent about the high-grade ore officially reported when they made in last year quite a move in the mines shares. The management also reported important work in Caledonia at about that time. The find reported in Alpha by the superintendent in his annual report has been allowed to sleep; when it is to be reported found in lower down is an open question and only answerable when the pool wishes to deal out the stock again at a good round profit. Similar statements can be made of other mines in the Gold Hill group. Brokers are discussing the west ledge of the Comstock. About a year ago several of them visited the Comstock and were agreeably entertained by Supt. Keating. He took them down the Savage and Norcross mines, showed them around generally, and then, while examining the back-dike wall which forms the foot-wall of the Comstock lode, he is reported to have said: "We will have to penetrate this black dike wall and find something to the west, or we must get the water out and go for the deep levels, because the east country is exhausted of its ore." Since that time Chollar, which is on the south line of Supt. Keating's mines, penetrated that dike wall and found a quartz ledge to the west 50 feet wide. Rumor has it that Supt. Keating was instructed by the President of his mines to fill up the west drifts in his mines and that the orders have been obeyed. Savage, by some accident, has found some ore to the west of the incline, and this find is more than likely to be the cause of more inquiry for the west ledge. Con. Cal. and Virginia had to go east 200 feet from its shaft on its 1200-foot level to get into its "bonanza." Now it goes west 200 feet on its 1650-foot level to get into its new ore body, which ore is in the west ledge.

 keeping, Telegraphy, Penmanship, Drawing, all the
 English branches, and everything pertaining to business,
 for six full months. We have sixteen teachers, and give
 individual instruction to all our pupils. Our school has
 its graduates in every part of the State.
 Send for CIRCULAR.

C. S. HALEY, Secretary. E. F. HEALD, President.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC COAST
 Borax Company, San Francisco, July 31, 1891.
 At a meeting of the Board of Directors of the above-
 named Company, held this day, a Dividend (No. 8) of
 One Dollar (\$1.00) per share was declared, payable
 MONDAY, August 10, 1891. Transfer books will close
 August 5, 1891, at the office of the Company, No. 230
 Montgomery Street, Rooms 11 and 12.
 ALTON H. CLOUGH, Secretary.

Practical Treatise on Hydraulic Mining.
 By AUG. J. BOWIE, Jr.

This new and important book is on the use and con-
 struction of Ditches, Flumes, Dams, Pipes, Flow of Water
 on Heavy Grades, methods of mining shallow and deep
 placers, history and development of mines, records of
 gold washing, mechanical appliances, such as nozzles,
 hardy cutters, rockers, undercurrents, etc.; also describes
 methods of blasting, tunnels and sluices; tailings and
 dump; duty of miners' inch, etc. A very practical work
 for gold miners and users of water. Price, \$5, post-paid.
 For sale by Dewey & Co., Publishers, 290 Market St., San
 Francisco.

WILLIS G. DODD, Vice-President and Manager.

IRA P. RANKIN, President.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have
 our new Concentrating Belt manufactured in
 San Francisco; we can therefore fill all orders
 on short notice. The length and width of these
 belts are the same as is used on the Frue or
 Triumph Concentrating Machines, but can be made of any
 length or width desired. The advantages of these belts
 over any others will be readily seen by practical millmen.
 First, the flanges or edges of our belt stand at an acute
 angle inclining toward the center, and therefore readily
 conform to the change of direction while passing over
 the end rollers; thus the vibration and loss caused by the
 frequent breaking of the flanges of the old style belt is
 practically done away with. Again, our belts, at intervals
 of two to four feet, have a very slight rifled surface for
 the space of three inches, which tends to equalize the
 pulp on the belt, and prevents it from banking on the sides and
 forming channels through the center. These slight rifles
 also save very fine sulphurets and the quicksilver that
 would otherwise escape with the tailings from a belt,
 the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM. NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

PROTECTED BY PATENTS—September 2, 1879
April 27, 1880; March 22, 1881; February 20,

Patents applied for.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Orissa Valley, Nevada Co., Cal.
ORISSA VALLEY, NEVADA CO., CAL., Nov. 10, 1886.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

COMMENT—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

(Signed) Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.
121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS. Varying from the fraction of 1 up to 15 and 20-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY UNEQUALED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Give a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

Crushing and Concentrating Ore.

The arrangements in a stamp-mill for crushing and concentrating ore are about alike in all mills in these days, practice and experience having long since proven the best system. Gravity plays an important part in the plans in vogue, the lump ore from the mine being dumped into the ore hoppers at an elevation, and the ore then passing downward to and through the various appliances for crushing, pulverizing and treating it, the tailings finally passing away at the lowest point. Few modern gold mills are without concentrating plants to catch the sulphurets, these being treated by a subsequent process.

Two of the cuts on the first page of this number of the PRESS (for which we are indebted to the *Overland Monthly*) show the battery and concentrating floors of a large mill in Sierra county. The mill has 60 stamps, and there are 24 concentrators. The concentrating floor looks in the picture like a place with many complications of machinery, but in reality the machines are automatic in their action, and, regulated, once do their work with little attention. One reason that quartz can be worked so cheaply in these times lies in the fact that the machinery in use requires so few men to attend it. As to cost of working gold ore, some interesting figures are given in another article in this issue.

MINING BUREAU SURVEY.—John B. Hobson will soon commence, with a competent corps of assistants, geological and mineralogical surveys for the State Mining Bureau, his especial field being the counties of Nevada, Placer, El Dorado and Siskiyou. The work in Nevada county will be commenced in about two weeks, and will be made very complete of the quartz and auriferous gravel formations.

RAILROAD CONTRACTORS on the Tinto range line, Utah, have struck three valuable bodies of ore in tunneling in the mountains at Homansville pass on the east side of the mountains, in which the great mining camp of Eureka is situated.

A DIAMOND DRILL will soon be set at work at Willow creek, Siskiyou county, to prospect the coal beds there. Coal is now being taken from the old cuts opened.

CORRESPONDENCE.

we admit, unindorsed, opinions of correspondents.—Eos.

Calaveras County Mines.

(From our Traveling Correspondent.)

EDITORS PRESS:—Leaving Mariposa, I drove north to reach Amador county. Passing the old Calaveras, which is now idle, I reached Sheep Ranch.

The principal mine of this section is the Sheep Ranch, owned by J. B. Haggin, with W. H. Clary superintendent. The mine is keeping up its reputation, and at this time the shaft is being sunk from the 1100 to the 1200 foot level. The vein runs from nothing up to five feet in width. The high grade of the quartz, coned with the 1200-foot shoot, make the Sheep Ranch an exceptionally good mine. It is one of those mines that mining operators prefer to own entire—"good enough to keep"—and are not stocked, but little known, and not even mentioned in the report of the State Mining Bureau. If investors knew more of this class of mines, they would not be so quick to condemn mining and assert that it is not a legitimate and profitable industry. It is a difficult matter to give the exact output of this mine, as it is not always policy to publish the facts. Mr. Haggin, however, is credited with saying that the net profit is only \$80,000 a year, which is a very fair showing for a 20-stamp mill.

Indian Creek.

The old Right Bower is idle. Adjoining is the Washington, with genial Harry Harris in charge as superintendent, and he is the right man in the right place. The mine is being developed by lawyer Campbell of San Francisco. Previous to Mr. Campbell's securing the mine, it was operated by some parties who kept the mill running from waste of the dump pile. This paid about \$10 a ton, but as the sulphurets were largely from the country slate, which would go about ten cents an acre, the results were not satisfactory. Mr. Harris has confined himself to the vein and has shown up a body of ore that will pay for the mine before the bond expires. The higher grade ore is shipped to Selby & Co. and realizes as high as \$2.50 a pound. The average milling ore so far has been \$40, with 5 per cent of galena sulphurets that average \$300 a ton.

Mr. Jaquith is prospecting an old mine on the ridge, below the Washington, and it is hoped he will meet with the same good fortune that has come to Mr. Campbell.

The Ragge Bros. of Sheep Ranch are driving an 800-foot tunnel to cut the vein on the Equity mine, and will cut the vein at 280 feet in depth.

El Dorado.

There is little doing in this section. Mr. Rodaseni has a number of valuable prospects that are partly developed and worth looking at by investors. North of El Dorado and near Railroad Flat is a mine called the Greek. The mine is owned by George Nickolls, and, though easily reached, once you know the road, is difficult to find when, like the writer, you go on the hunt for it without a guide. Mr. Nickolls has put down two shafts each 80 feet deep and 110 feet apart. These shafts are under-
out by a drain tunnel showing a vein from one to two feet in width of ore, that, for a distance of 110 feet, averages \$20 to the ton. There are about 250 tons of the same class of ore on the dump. To further develop the mine, Mr. Nickolls is driving another tunnel, which will cut the vein and the ore shoot about 280 feet deep. This tunnel, when in, will prove the vein. The mine has the appearance of a good investment with time for development.

Railroad Flat.

This old camp has a large number of veins with short surface shoots which are worked to a profit by the miners. None of them have been given sufficient depth to prove them. There is a number of old mines that it is thought are good, but for some reason they are not worked. Among them is the Fine Gold (J. B. Haggin's) and the old Pettloot mine. This latter mine was very rich, but in sinking, the shoot was gone through. The superintendent drifted west instead of east, and not finding ore, closed down. It is the common opinion of all the old miners that the Pettloot is still a rich mine, if properly opened.

The Bald Eagle.

J. E. Euright is superintendent of this mine. The mine is situated on the south bank of the South Fork of the Mokelumne river, one mile north of Railroad Flat. The mine is opened by tunnels which cut the vein 250 feet deep and show its width to be 18 inches to seven feet.

The ore averages \$10 to \$15 a ton in free gold and three to four per cent in sulphurets. The mine has a ten-stamp mill, and is in active and profitable operation.

Calaveras Blue-Gravel Lead.

If any evidence were needed that the MINING AND SCIENTIFIC PRESS is extensively and closely read, and the articles of the writer accounted reliable, it is shown here. On my last trip through this section I called attention to this large, unexplored, unclaimed bed of blue gravel. Immediately after that article appeared, parties came in from all parts of the coast, and located the old, covered river channel from this point to Volcano, in Amador county. In a short time these locators will be at work, and

this section made to equal, if not excel her early placer history. At this time the principal work is on the

Lava Bed Mine.

This mine is about two miles south of Railroad Flat, and is situated on a fork or branch of the main channel. The cone is almost east and west, while the main channel, which is to the east, is almost north and south. The gravel is covered with about 100 feet of pink lava ash, followed, in this the Lava Bed mine, by an average of nine feet of blue gravel resting on a slate bottom. The wash is heavy, the gold coarse and bright. So far the channel has shown a width of 80 feet, though the rim has not been crossed in the last 100 feet of the drift.

Crosscuts have been driven 50 feet each way. The average value of the cement thus far has been \$4 in free gold, which can be washed out of the gravel. The remaining gravel seems to hold as much more, which can only be separated by crushing. This gravel deposit was the feeder of Neilson's gulch, as the gulch paid up to the lava. Mr. Lampton put down a number of shafts to strike the blue gravel channel. Beginning at Neilson's gulch is the Summit lead of 160 acres with extension of 50 acres, owned by Evan & Lampton. Adjoining is the Three Brothers—60 acres—owned by Lampton Bros., which joins the Lava Bed, 120 acres, owned by Evan & Lampton. Adjoining is the Wallace, 80 acres, owned by Evan & Lampton.

Next comes the Nut Pine, 140 acres, Haupt & Lampton owners. This brings the east and west channel up to the main or north and south channel. At the junction, Lampton & Evan have 160 acres. South on the main channel is the Shepherd and adjoining it the Swank & Gamble; while to the north of the Evan & Lampton is the Swank. From this point north, claims innumerable have been taken up. In addition to the work being done on the Lava Bed, the Nut Pine owners put a shaft down 128 feet and struck gravel, but were not able to handle the water with a common bucket, so stopped. Upon the main channel, Swank & Gamble put down an incline shaft 200 feet long, struck the lead, and will now erect a hoist. There is no trouble about operating any portion of the channel by incline shaft, as the gravel is in no place covered by over 150 feet of lava.

If all of these claims on the east and west channel were consolidated and operated through one, main tunnel from Neilson Gulch to the main north and south channel, the entire area could be drained and the whole district worked at a big profit. The present owners are not able to carry the proposition through, but will meet capitalists half-way in what looks to be a most promising enterprise.

West Point.

West Point, like some people, is never twice alike, and seems to delight in proving the old song:

"When you're up, you're up.
When you're down, you're down.
When you're half-way up,
You're neither up nor down."

Just now it is "neither up nor down," but looks as though it would soon be on its feet, and that to stay.

The Lone Star.

J. G. Rule is superintendent. This mine is now equipped with Barleigh drills, and with the cost of operating thus lessened in the exceedingly hard country rock, the mine bids fair to do well. The lower drift is being driven ahead, with eight feet of good ore in sight.

The Riverdale.

T. Severance is superintendent of the Riverdale. This mine, like the Lone Star, which is just below it, is being developed by tunnel to cut a shoot of ore that has been opened in the upper workings.

The Smith Mine.

The shaft is being put down by contract and is now down 135 feet. Drifts have been run about 100 feet on the vein, which show an average of two feet of vein matter, with granite walls. The ore in the shoot is of high grade. Adjoining, or rather paralleling the Smith, is the old

Blazing Star.

C. J. Moore is superintendent. At this time the shaft is being put down and has now reached 360 feet. In the bottom of the shaft the same shoot of ore that was cut on the 200-foot level is being opened, with the vein widening. The ore is of the same character. On the 260-foot level the vein was seven feet, with the ore, which was shipped to Selby & Co., realizing \$125 a ton. The ore now coming from the shaft, mills \$70 a ton in free gold and carries a large percentage of sulphurets that run from \$125 to \$700 a ton. This opening the shoot on the 360 level shows that the vein and the gold go down and give evidence that the Blazing Star will "blaze" the way to a new era of profitable mining in West Point by opening the old superficially worked and abandoned mines and giving them depth. E. H. SCHAEFFLE.

Oro Grande, San Bernardino Co.

EDITORS PRESS:—There is quite a boom in this camp, and sales are being made almost daily. As the veins all improve as they gain depth, this is liable to make a permanent camp. The Ophir mine, which has attained a depth of 175 feet, shipped 100 tons of ore to the Sidewinder mill, at Victor, a distance of 11

miles, which milled \$54 in gold per ton. There are still 450 tons of ore on the dump, which will give just as good returns. The owners of the mine contemplate erecting a mill of their own. There are eight men working at the mine taking out ore daily. The vein is about four feet six inches wide, two feet six inches of it being pay rock. The mine is owned by San Diego parties.

The Carbonate mine, from which a pocket of ore was taken out running \$30,000 per ton in gold, at a depth of 240 feet, is timbering up their shaft preliminary to active developments. Mr. Corbet, who was at one time foreman of the Contentment mine at Tombstone, A. T., has charge.

The Althea mine, owned by Blaisdel and Embury, located on the flat within about 200 yards of the townsite of Oro Grande, has a vein 50 feet in width, which, according to assays, will average \$20 in gold across the vein.

Other prospects are looking well, and as soon as a good mill, with a thorough, practical millman in charge is erected, this camp will produce considerable gold bullion. MINER

The Precipitation of Metals from Hyposulphite Solutions.

(Continued from last issue.)

Read by C. A. STETEFELD, of San Francisco, before the American Institute of Mining Engineers.

§ 6. Precipitating-Coefficients.

The precipitating coefficients of a sulphide solution are the quantities of silver, copper and lead precipitated for 100 parts of caustic soda, or caustic lime consumed in its manufacture. In the same way precipitating-coefficients can be established for sulphur.

If a metal is precipitated by an alkaline polysulphide, RS₂, one equivalent of the latter precipitates one equivalent, or a double equivalent, of the former, (x-1)S being liberated as free sulphur.

The following facts are of importance in reference to precipitating-coefficients for caustic soda. If the lower sodium polysulphides are prepared either from lye of proper concentration, but not of sufficient temperature before adding the sulphur, or from diluted lye by boiling it with sulphur, reagents may result with precipitating-coefficients for caustic soda far below the normal values recorded in tables A and B. This can only be explained by assuming that a part of the caustic soda remains free and uncombined with sulphur, which is actually the case. For this and other reasons already stated, it is not judicious to attempt the preparation of a solution containing Na₂S in perceptible quantity in order to save sulphur. A solution in which Na₂S largely predominates will always have precipitating-coefficients below the normal values for caustic soda.

On the other hand, very concentrated solutions of the higher polysulphides may give precipitating-coefficients far above normal values. Since, however, these abnormal values, as already stated, are only obtained by partial precipitation of silver, copper, and lead from a hyposulphite solution, and do not exist in complete precipitation, and consequently not in practical mill-work, the subject is without economical value, and will not be discussed here.

Although great accuracy cannot be claimed for the tables below, regarding actual mill-work, they will be sufficiently near the truth to base calculations of practical value upon them. They refer to freshly prepared sodium sulphide, and not to solutions oxidized by long contact with the atmosphere.

The following precipitating schemes may be considered of practical value.

A. Lead and calcium are absent, or only present in very small quantities.

Method 1.—Precipitation by Na₂S₂, or by CaS₂.

B. Lead and calcium are present in perceptible quantities, or lead alone is present.

Method 2.—Precipitation of lead by caustic lime, followed with precipitation of silver and copper by CaS₂.

Method 3.—Precipitation of lead and calcium by Solvay soda, followed with precipitation of silver and copper by Na₂S₂.

C. Calcium is present in considerable quantity, but not much lead.

Method 1, as given above, is here applicable; but in naming Na₂S₂ as precipitant under "C," it is distinctly understood that the reagent should be practically free from Na₂S, so that an oxidized solution contains only a minimum of Na₂CO₃. If it cannot be prepared with the amount of sulphur needed for the preparation of Na₂S₂ according to equation No. 1, more sulphur must be used.

In considering the economy of the different methods of precipitation, it would be misleading to rely only upon the figures given in the tables. There are other important elements that must enter into calculation, outside of the cost of chemicals, and the relative proportions of silver, copper, lead, and calcium in the solution. It is important, for instance, whether the lead-calcium carbonate can be profitably sold. If calcium predominates, the product may be exceedingly low in lead, and only saleable at the expense of the silver it contains. An equally important factor is the grade of the sulphides in silver. The lower the grade, the heavier the freight and the melting charges per ounce of silver, or the cost of refining if sul-

phides are treated at the mill. To this must be added increased expense in handling, namely, pressing, drying, sampling, and packing of precipitates. Evidently, general rules cannot be established regarding the most economical method of precipitation, but a calculation must be made for each individual case.

As repeatedly stated, tables for CaS₂ cannot be calculated on merely theoretical grounds. An attempt, however, is made in tables E and F, to base values for CaS₂ on actual mill-statistics.

A comparative test was made between Russell's sulphide and CaS₂ at the Cusihiuriachi mill, Mexico, as follows:

The mill, reducing 50 tons of ore per day, was run 38 days, using Russell's sulphide, and 21 days, using CaS₂ as precipitant. The quantities of chemicals consumed were as follows:

Using Russell's Sulphide:

Average value of ore: 35.1 ounces silver per ton.

Consumption of caustic soda: 4.4 pounds per ton of ore.

Consumption of sulphur: 2.9 pounds per ton of ore.

Using CaS₂:

Average value of ore: 39.0 ounces silver per ton.

Consumption of caustic lime: 24 pounds per ton of ore.

Consumption of sulphur: 10.3 pounds per ton of ore.

Outside of a difference in value, the ore was of exactly the same character in both cases. For better comparison, I reduce the above figures for CaS₂ to what they would have been in working ore of 35.1 ounces silver per ton, with the following result:

Corrected Values, Using CaS₂:

Consumption of caustic lime: 21.6 pounds per ton of ore.

Consumption of sulphur: 9.3 pounds per ton of ore.

To make these statistics more available for comparison, the composition of the sulphide should have been ascertained, besides the consumption in hyposulphite. Under the circumstances, I have to take the figures as they are. Considering what has been said about the preparation of CaS₂, and its deterioration by oxidation, the much higher consumption of chemicals involved in manufacturing CaS₂, compared with Russell's sulphide of equal efficiency, is by no means extravagant. To make comparison perfectly fair, we should add, however, for CaS₂ a gain of about 20 per cent in hyposulphite, on a basis of the quantity of this salt contained in freshly prepared Russell's sulphide. For convenience in calculation, the addition of calcium hyposulphite is put down as its equivalent of the sodium salt.

In the financial table F, the price of the caustic lime is taken at 3 cent per pound, and other chemicals as stated in table D.

It is interesting to compare table F with table D. Even under favorable assumptions for CaS₂, this reagent is, at stated prices for caustic soda, sulphur and sodium hyposulphite, very much dearer than Na₂S₂.

CaS₂ would be only cheaper where caustic lime can be obtained at much less than 3 cent per pound, and where the cost of sulphur is abnormally low compared with that of caustic soda.

For this reason, in examining different methods of precipitation for a special case under normal conditions, we may just as well pay no attention to CaS₂ in Method 1, and discard Method 2 altogether.

Finally, if in lixiviation a considerable amount of sodium hyposulphite is consumed to keep up the strength of the stock-solution, it will be more profitable, in most cases, to use an oxidized sodium sulphide solution in place of one freshly prepared. Although the cost of precipitation is thereby apparently increased, the total cost of lixiviation will be diminished.

It has been claimed that in using CaS₂, the sulphides precipitate quicker and settle better than with sodium sulphide. This claim is not sustained by practical experience.

We find it stated in treatises on metallurgy that calcium hyposulphite is a more energetic solvent for gold than the sodium salt. This statement is without foundation in theory or practice. The solvent energy of calcium hyposulphite for silver-compounds is slightly inferior to that of the sodium salt, according to Russell's experiments.

The difference in deterioration of the two hyposulphites by atmospheric influences has already been mentioned.

(To be Continued.)

MEERSCHAUM.—Neff & Rogers put a number of men to work last week on their meerschaum mine, and have taken out some very fine specimens. While there is a large bed of the meerschaum, good solid specimens are rather scarce so far, but as the mine is opened up it will become more solid. Nearly all meerschaum pipes are made from the shavings, as large specimens of meerschaum are scarce in any country. Mr. Neff states that there is no question as to the discovery being meerschaum, as he has been in communication with several importers for some time past. One of the heaviest importers in the United States is trying to contract for the entire product of the mine, and expects to be able to ship it to Europe in large quantities. It is a valuable discovery, and one which will soon bring a great deal of money into Grant county.—Silver City (N. M.) Enterprise.

PLAN OF FRAME FOR TOP-PLATFORM OF NO. 1 BLAST-FURNACE AT FRIEDENSHUTTE.

PLAN OF CLOSED TOP AND CHARGER OF NO. 1 BLAST-FURNACE AT FRIEDENSHUTTE.

PLAN OF NO. 1 BLAST FURNACE AT FRIEDENSHUTTE.

VERTICAL SECTION OF CLOSED TOP AND CHARGER OF NO. 1 BLAST FURNACE AT FRIEDENSHUTTE.

German Progress in Metallurgy.

In recent numbers of the PRESS, illustrations have been printed showing certain features of the progress of German practice in metallurgy. These are from a paper by Dr. Herman Wedding of Berlin, read before the American Institute of Mining Engineers. In our recent numbers, plans and sections were given of the regenerative coke ovens and condensers for saving by-products. In this issue are shown drawings of the improved blast furnace at

Friedenshutte, showing that in furnace construction, practice inclines more and more to the entirely free stack without exterior masonry. Generally the furnace is closed in front as a corncob furnace.

The conditions of the German blast-furnace practice vary greatly. The native ores are nowhere nearly as rich as the more important ores employed in America; for instance, the specular ores of Lake Superior and the magnetites of the West. Perhaps there is no other district in the world where the furnace charge

carries so little iron as in Upper Silesia, where it falls sometimes below 30 per cent.

It is not merely the low tenor of the ores in iron, but also its usual accompaniment, a high tenor in silica, which causes this character of charge. Concentration of the ores is, with a few exceptions, impracticable financially. The finely divided condition of the ore in the gangue prevents any separation by gravity without a previous fine-crushing; and this, again, would introduce new difficulties into the working of the blast-furnace.

One disadvantage they have in common with the iron-masters of the United States—the necessity, namely, as a general rule, of railway-transportation over considerable distances for ores or coke, or both. But they lack the magnificent water-ways, like the great lakes of the North; and the development of internal canals, as a remedy for this natural disadvantage, is still delayed in Germany. The most favorably located furnaces with reference to raw materials are those of Upper Silesia, where the Friedenshutte furnace is situated.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

QUARTZ MOUNTAIN.—Cor. Amador Ledger, Aug. 8: The reverberations of giant powder are again being heard in the interior of the old mount. The company that has taken hold of operations this time is overhauling the old mill from the foundation up. L. Dunbar and a force of mechanics are making quite a change in the appearance of the mount. Arthur Call has charge of the operations. He intends to put in an entirely new plant for the purpose of saving the precious metal, and is very sanguine as to the results of some of his own improvements, the result of a seven years' experience at the Gover. Mr. Goodman and A. H. Bean still hold the fort at the Goodman mine.

OLETA.—A new party has started up the old Hill mine, and every one is in hopes they will get as far as the gold this time. The gravel mine below town is running along the same as ever.

Calaveras.

WEST POINT.—Cor. Calaveras Chronicle, Aug. 8: The Paddock and Morris mine is worked by shaft, and the hoisting is done by horse power. Twelve tons of free-milling rock were taken from this mine and worked, and the yield was \$122 per ton. The owners are taking out rich rock every day. The Dennison is also taking out some rich rock. Prospects look very favorable in the Woodhouse, Keltz and Camille mines. Last Saturday, Aaron and William Cook made a very rich strike in the old Anna mine, formerly owned by Wm. Steger. Prospects in the Horn Spoon mine show a valuation of from \$500 to \$500 per ton. Prospecting is still going on in the Novella, Mentzel and Chick mines. The Buchanan, Black Wonder and Smuggler mines are all turning out rich rock and giving their owners a rich harvest. I believe the Tom Paine mine will soon have a force of men at work and it is to be hoped will soon have its name recorded on the "good" list.

COPPER.—Cor. Amador Ledger, Aug. 8: Mr. Burgen is making preparations to start up his copper mine about two miles from Lancha Plana, on the Calaveras side of the river. When the mine gets in good running order it is said it will employ from 300 to 400 men.

El Dorado.

HYDRAULIC ELEVATOR.—Georgetown Gazette, Aug. 8: The hydraulic elevator at Mammoth Bar is doing splendid work in raising and washing river-bed gravel this season, under the management of Col. Davis. The California Water Co. furnishes the power—about 400 inches.

Inyo.

BIG PINE.—Cor. Inyo Index, Aug. 5: The boom so confidently predicted by the Index seems to approach this locality rapidly. Chances are largely in the direction of increased operations in the borax fields of Saline Valley. The unequalled success of the enterprising firm of Conn & Trudo of this place has stimulated others to investigate the merits of the extensive borax fields of that district. Mr. J. H. Roberts and H. J. Lent, accompanied by Gen. John Hewston, John Hewston Jr. and W. C. Chapin of San Francisco, left here for the claims of the first-named gentleman on Tuesday last. They went equipped for a thorough test of the merits of the locations, and if found satisfactory, the latter gentlemen will undoubtedly invest and put in a plant of large capacity for the production of the borax of commerce. There are many inquiries for Inyo mines on the part of San Francisco capitalists and agents of London companies. Mr. J. Sellier, a French expert of note in the mining circles of the continent, is now on a visit to the huge copper claim in the Saline Valley country, and this immense property is likely to be added to the list of foreign-owned mines. M. Sellier represents a London company largely interested in the development of mines in old Mexico. Should the company invest here, the Whale Copper mine will be thoroughly developed. Mr. Dunlap of Fish Springs visited the hamlet yesterday and reports a number of good cleanups in that camp.

Nevada.

HARTERY.—Grass Valley Tidings, Aug. 7: At the meeting of the stockholders of the Hartery mining company, it was decided to bond the Roach claim and work it in conjunction with the ground adjoining the Hartery, located by the company some time ago. The plant will be removed and a new shaft put down. The ledge will be cut at a depth of about 200 feet. A meeting of the directors will be held at once, and the new operations ordered. The decision by the stockholders was practically unanimous, 70,000 shares being voted for the proposition and but about 1400 against. It is understood that the bond price of the Roach claim is \$5000.

A LARGE LEDGE.—Down on Greenhorn there has been developed to some extent, by tunnel, a ten-foot ledge of quartz, which shows well in sulphurets and looks as though it would pay, under the proper conditions. The property is owned principally by Chas. Duval and M. Provines of this city.

RIVER MINING.—Grass Valley Union, Aug. 8: The Chinese Co. that is working in the river-bed on Bourne, Pollard & Co.'s location on the Yuba, below the junction, have a large section of the river-bed exposed, by the wing-dam that has been built, and are sinking a pit through the gravel. This pit is now 12 feet in depth, and it is expected that it will have to be sunk 25 feet in all. In sinking, a Chinese pump was found, which was used on the claim 25 years ago, and the present company, who knows of the former operations, says good pay was obtained, although the bottom was not reached, on account of there being too much water. This time the claim has been rigged up in a superior manner, with pumps that throw a large and constant stream of water, and a powerful derrick that will remove any boulders that may be encountered. It is the intention when pay gravel is reached to work night and day shifts in the claim. Three other companies are at work in the river besides the company above mentioned, but they are not so well advanced in their operations, but will not have to remove so much top dirt. The river does not fall as fast as was anticipated, as the water is yet about four feet in depth,

Plumas.

SPANISH RANCH AND MEADOW VALLEY.—National, Aug. 8: Last Sunday morning we went to Spanish Ranch and Meadow Valley. At Meadow Valley things were rather quiet, not many of the old miners being around. We made some inquiries, however, as to the mining outlook, and were informed that considerable prospecting is being done in the hills around about, and some good results obtained. On our return, we stopped at Spanish Ranch, where we found several of the old-time miners sitting around, telling of the "days of '49," how when they mined on the East Branch, at the end of a day's work, a yeast-powder can full of golden nuggets was usually picked up. There are several mines around Spanish Ranch that when opened up in good shape will pay a handsome dividend, and there can be but little doubt that a mining boom will strike that section before long.

GREEN MOUNTAIN.—Plumas Bulletin, Aug. 5: The force of men at work on the Green Mountain ditch have completed their work, the water has been turned in and put through the newly-laid pipe without any accident. The air-compressor at the mine has been put in order and probably it will be started to-day. The mine relieved of foul air, the work of repair and development will proceed to greater advantage, though up to date remarkably good progress has been made. Mr. Cornell and Col. Smith are giving the mine their personal attention, and the work is being pushed with energy. Considering the unexplored ground on either side of the tunnels into this mountain—a network of quartz veins—and the large ore bodies in the mines beyond the face of the Green Mountain tunnel, where ore bodies will be tapped from 1000 to 1500 feet in depth. The certainty of a big and profitable mine seems to be beyond question.

Sierra.

POKER FLAT.—Cor. Mt. Messenger, Aug. 8: Nick Berets is employing 17 men in his drift mine at Bunker Hill; 12 men are breasting. Tunnel 1700 feet, mouth to face; 1100, daylight to gravel. Water is beginning to slacken. Lead has just commenced to dry. Average yield of gravel, \$1.25 to \$2 a carload. Dark blue colored gravel, heavy, well-washed quartz boulders. Depth of pay streak, 3 1/2 to 7 feet; width, far as ascertained, 370 feet, with no rims in sight—possibly junction of two ancient river channels. Trains are run by hand power. New tunnel is contemplated in the near future to reach the lead, within only 500 feet. Water blast, 40 feet fall from ravine above, through 11-inch diameter iron pipe in tunnel, for ventilation. On an average, six to seven carloads to the pick—ten-hour shift—are rolled out; in harder ground, four to five loads. Gold is worth \$17.50 to \$18.50 at Scamman's bank, Downieville. Specimens, average value, from 25-cent pieces to \$2, \$3 and \$5. No snow is in sight on the adjoining mountain ridges and peaks. In sunnyside claim, southwest of Berets', tunnel is 500 feet long, within 100 or 150 feet of this comparatively unexplored channel, recently discovered by Mr. Berets—the best way to reach the lead. Prospects are bright for development of valuable mining properties hereabouts in the near future—very encouraging to miners. T. C. Corlett has begun preparatory work for next year, sinking an incline from his tunnel and employs three men. At Steamboat Hill mine, owned by A. R. Brown and Wm. Jones, there was a recent cleanup of \$700. They are helping John Curtis to tunnel through a point for a ditch for mining purposes. Frank Retzer is drifting at head of Illinois canyon, with favorable results. J. K. Walls, of Howland Flat, has a contract for 100 feet of tunnel, at \$8.50 a foot, through lava, for the Forest Queen Co. C. R. Scott is busy, as usual, developing his gravel claim and he believes that the back channel is very rich. J. Z. Hough intends extending his tunnel for the lower part of the rich Howland Flat channel, that he believes is within 200 feet of the face.

TUNNEL.—Mt. Messenger, Aug. 8: The tunnel being run on the quartz ledge at the head of Jim Crow canyon, by Mr. Rouse, reached the ledge last Saturday. The distance was 175 feet. The workmen drove into the ledge about three feet, which showed good-looking ore. This new tunnel gives a back on the front ledge of about 100 feet. Work on the mill was begun again the first of the week. The Fessler claim, at Alleghany, is reported as pay-quite as well as ever. The report is that \$10,000 were shipped last week. There seems to be a fair prospect that the Gold Bluff mine will soon be sold. The parties who were here recently to examine it, were well pleased with the prospect.

ANOTHER BIG CLEAN-UP.—Nevada Transcript, Aug. 8: Accounts from Fessler's quartz mine in the Alleghany district, Sierra county, continue to be very gratifying. If the property were 20,000 miles from here in some almost impenetrable locality peopled by bloodthirsty savages, an intense excitement would be created about it in the minds of California miners. But as it happens to be situated within less than a day's travel from Nevada City, the head-center of the richest gold mining region in the world, people take the marvelous yield as a matter of course and go along quietly about their business. Mr. Fessler has just taken over to Forest City another big lot of bullion estimated to amount to from \$60,000 upward, persons who ought to know claiming that the value of it far exceeds the sum mentioned.

GIBSONVILLE.—Cor. Mt. Messenger, Aug. 8: D. Corbett employs 20 men, working tailings in the North America creek. Horace Tabor has recommenced work on his old drift claim, the owners of which have recently incorporated under name of Tabor G. M. Co. Tunnel is in 2300 feet, in blasting rock, and will be pushed vigorously ahead to pay gravel. Altitude of the Thistle shaft is 5800 feet. Dined here with Supt. Gourley. Was down the 450-foot shaft with C. B. Wingate, General Manager, who showed me through the mine far as developed. Main tunnel crosses channel 500 feet, then swings northeastward. Heavy wash from shaft to end tunnel. A well-defined pay streak has been developed, and when main tunnel catches bedrock, breasting is to be commenced. The main tunnel will be run in the general direction of the old Bootjack shaft workings. At present there is only accommodation for 40 men. Contracts for provisions and timbers are being offered, and preparations made to work the mine for some time through the shaft. Amount of water to be pumped is not very large, but may increase considerably as channel is followed up the ridge. It is hoped and believed

that mine will be on a good paying basis in a few months. Shaft is in good order and needs very little repairing. Bedrock squeezes some in tunnel, but no swelling bedrock has been encountered. Extent of channel or width of pay streak are unknown, but indications evidence a wide and rich lead.

Siskiyou.

CINNABAR MINES.—Siskiyou Telegram, Aug. 5: After showing us through the mines, which in reality is a mountain of cinabar, and graphically explaining the process by which the ore is reduced, we visited the site where the company is building a fine furnace, the foundation of which has just been laid. This furnace will have a capacity of 20 tons per day of 24 hours. This is only one of several furnaces to be built later on when wagon communication is established with the outer world. This lack of a good wagon-road is a serious drawback, not only to the company, but to Siskiyou county as well. Mr. Geo. Senn says that he is in Siskiyou county, and wants to remain here, and to show his appreciation of the county and its people, has named his mine the Siskiyou Consolidated Q. M. Co. The company has 30 men at work at present, which force will be largely increased as soon as wagon communication is established.

EAST RIM.—Yreka Journal, Aug. 7: Lee, Lash & Co., of the Greenhorn mine, upon thoroughly investigating the bottom of their new shaft just sunk near the stage road, have discovered the east rim of the blue-gravel channel, which they have been working near Lee's house, and will commence running a drift in that direction, to tap the blue-gravel bed east of the drift where the cave occurred. From the appearance of the blue gravel near the bottom of this new shaft, the indications are more favorable for rich pay than at the old shaft, where they realized over \$6000 in two months. The Chinese Co., working the old Bentz Bar claim, near Honolulu, Klamath river, has been taking out considerable gold dust lately. The Bebe Bar claim, on Klamath river, which is now being worked for J. S. Cleland, prospects very well, considering no signs of bedrock have been reached. At the other Klamath river claims, the companies are not yet down to bedrock channel, but will be very shortly. Marshal Mahen returned from Beaver creek, Siskiyou mountain, last Sunday, and reports considerable mining in progress on Hungry, Beaver and Bumble Bee creeks. On the latter creek, Thos. Jones of Henley has a force at work on the California Queen quartz mine, which prospects well, and there are some four or five placer claims on the same creek being mined with good success.

Tuolumne.

TO HAVE A MILL.—Sonoma Democrat, Aug. 8: The Stanley mine, situated on Kanaka creek, one mile northeast of Jacksonville, on the east series of the mother lode, is to have a ten-stamp mill erected near by. Frank McCann is the superintendent, and the value of the property will soon be demonstrated. The vein is from 100 to 300 feet wide, and pays well in free gold and sulphurets, as denoted by the assays. The mill to be placed on the mine is the same which has been in use at the Patterson mine.

NEVADA

Washoe District.

CON. CAL. AND VIRGINIA.—1650 level—The various openings of this level have continued to yield the usual quantity of ore. Ore of fair quality has been extracted from the drift run west from the top of the upraise carried up 59 feet above the southwest drift, also from the drift run east from winze No. 3, 73 feet down, in working upward from that point. 1750 level—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. The east drift from No. 1 winze, at a point 50 feet down, has been advanced 30 feet; total length, 56 feet, continuing in a quartz formation carrying a low assay value. There has been extracted from all parts of the mine during the week, 1374 80-2000 tons of ore, of which 265 1860-2000 tons were shipped to the Morgan mill and 1108 220-2000 tons to the Eureka mill. The average assay value of all of the ore worked at the Eureka mill during the week (1290 tons) was \$24.55 per ton. Bullion shipped to Carson Mint, assay value, \$78,477.10. The falling of the water in the Carson river has materially reduced the working capacity of the Eureka mill, and we have therefore resumed shipping ore to the Morgan mill.

OPHIR.—1465 level—We have continued our prospecting work from the openings in the vicinity of the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level. No ore extracted during the week. The ore which was shipped to the Morgan mill, 290 tons, has been reduced, yielding bullion of the assay value of \$7,043.88; which has been shipped to the company's office in S. F.

MEXICAN.—On the 1465 level, the south drift started from the east crosscut No. 1, at a point 618 feet in from the main north lateral drift, has been advanced 40 feet; total length, 132 feet; in vein porphyry showing clay separations.

UNION CON.—The northeast drift started from the east crosscut No. 2 on the 1465 level, at a point 833 feet in from the main north lateral drift, has been extended 27 feet; total length, 110 feet; in vein porphyry carrying some clay, and fine lines of quartz of low assay value.

ANDES.—On the 420 level east crosscut, No. 2 from the main north drift was advanced 10 feet and stopped; total length, 210 feet. Have put in bulkheads in this crosscut to stop the flow of water. North drift from east crosscut No. 3 was extended 17 feet in quartz of low value. East crosscut No. 4 on this level will be started to-morrow.

CHOLLAR.—Extracted and sent to the mill the past week 57 tons of ore, worth \$19.11 a ton, as per battery samples.

POTOSI.—The winze is down 85 feet below the 1500 level. The bottom is in porphyry and stringers of quartz.

WARD SHAFT.—The south lateral drift from the 1800 is out 200 feet; face in soft porphyry.

ALPHA.—North drift from west crosscut, 100 feet north of shaft, 500 level, is out 52 feet; face in quartz yielding low assays. North drift from winze, 550 level, is out 44 feet; face in quartz and porphyry.

EXCHEQUER.—East crosscut on north lateral drift,

150 feet north of the south line, 600 level, is out nine feet, face in clay and porphyry.

SILVER HILL.—South crosscut, 160 level, is out from the winze 650 feet; face in hard porphyry.

UNION SHAFT.—The west drift from the shaft, 900 level, has been advanced during the week 65 feet, a total distance of 850 feet; face in porphyry.

CON. NEW YORK.—The east crosscut, 1100 level, 535 feet north of shaft, is in 12 feet; formation soft porphyry.

OCCIDENTAL.—Have extracted and sent to the mill a total of 45 tons per day of fair-grade ore. The upraise from the 550 level at the head of No. 2 winze is up 22 feet, the top being in good ore. The south drift from No. 2 crosscut on the 650 level has advanced 12 feet; the face is in ore of the average value \$32 per ton. Milled during the week 305 tons of the average value of \$18.15 per ton.

GOULD & CURRY.—200 level: At a point in upraise No. 2, 100 feet up, started east on a small stringer of quartz and clay, which showed some value. Extended the same 10 feet. All work in the east and west crosscuts, 65 feet above this level, has been stopped. Started north drift in upraise No. 2, 65 feet above 200 level, and advanced the same 12 feet, through quartz showing some value.

BEST & BELCHER.—1000 level: West crosscut No. 3 has been extended 18 feet through porphyry and quartz showing some value; total length, 102 feet. 1100 level: West crosscut No. 1 has been extended eight feet and stopped; total length, 428 feet. Have not done any work in east crosscut.

UTAH.—On the 725 level the southeast drift has been extended 48 feet; total length, 94 feet, continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—On the 630 level, west crosscut No. 1, from the northwest drift, 571 feet from the shaft, is advanced 780 feet, 19 feet having been made during the week, in addition to smoke-house inside of drift 20 feet in length. The Kenosha tunnel has been enlarged and repaired 85 feet, leaving 80 feet to face of tunnel.

Arabia District.

RUN FINISHED.—Silver State, Aug. 8: Messrs. Saidmore & Sloan finished a run of 160 tons of ore from their mines in Arabia District a few days ago, which yielded 37 tons of bullion to the value of \$300 per ton. These gentlemen have a small furnace near Townsend and Fourth streets, in San Francisco, where this ore was reduced. They are enlarging their reduction works to the capacity of 40 tons per day, and will put a large force at work in their mines and ship several carloads daily.

Tuscarora District.

NAVAJO.—Times-Review, Aug. 7: The upraise from the intermediate drift has been extended 39 feet; no change elsewhere.

COMMONWEALTH.—No. 1 winze from the 4th level has been sunk five feet, and drift started to crosscut to the vein; progress made, 12 feet.

BELLE ISLE.—Line crosscut, 350-foot level, extended 12 feet, rock very hard.

DEL MONTE.—Third level: No. 2 north drift advanced 22 feet, face being all in low-grade ore, with seam of good ore on footwall.

NORTH COMMONWEALTH.—Third level: Have run an intermediate drift from top of No. 2 raise, a distance of 15 feet in fair-grade ore, average assay car sample, \$62 per ton. North drift from No. 1 winze advanced 28 feet, in vein matter.

NORTH BELLE ISLE.—East crosscut from the south gangway, 400-foot level, extended 19 feet. North drift from the south line crosscut, same level, extended ten feet; the vein is showing considerable spar.

Hawthorne District.

LAPANTA.—Walker Lake Bulletin, Aug. 8: The stope above the east drift, No. 6 incline, shows about 20 inches high-grade ore. In the east drift from the winze below the 100-foot shaft level, the vein is showing strong, carrying all high-grade ore; pitching south-west.

PAMILCO.—Have started a south drift on the ledge cut on the tunnel.

CENTRAL.—Stopping on the 150-foot level. Taking out the usual amount of ore.

MOUNTAIN KING.—Still drifting north on the main vein; ledge running from two to three feet wide, showing gold, lead and silver ore.

FAIRMOUNT.—Drifting south on the main drift; drifting north from the bottom of the winze below the tunnel; ledge showing well at all points.

HARTFORD.—Ledge has improved considerably during the week. About 20 inches between the walls showing considerable heavy lead.

GOLD BAR.—South drift, Martinez tunnel level, being extended on the vein, producing some ore.

WAR EAGLE.—Stopes yielding the usual quantity of good ore.

IDA.—Still producing the usual amount of high-grade ore.

NEW YORK.—South drift on the vein is being extended. The vein is very strong; about two feet wide, carrying gold and a strong streak of heavy lead.

El Dorado District.

MINING SALE.—Pioche Record, Aug. 6: The Southwestern Mining Company of El Dorado Canyon has purchased another lot of mines from John Powers there. The mines now sold are the Ea Extension of the Wall Street, Dutchman, Banner, Free Coinage and Roadside claims. The consideration paid was \$4700. These claims are mostly gold producers and adjoin the Wall Street mine, which the company has so successfully opened up during the past year. The new purchase indicates the confidence of the company in the district, who have operated in that district for many years past in the face of the greatest difficulties, but have made it pay, and now have a showing which they cannot exhaust in a year's hard work.

Pine Nut District.

PROSPECTS OF THE DISTRICT.—Virginia Chronicle, Aug. 7: Tony Cramer is on the Comstock, having recently returned from Pine Nut, where he located what he considers a rich claim within 200 feet of Zirn's bonanza. Cramer is much elated over the prospects of the district, and after securing necessary tools and machinery, will return to the scene of his labors. The daily arrivals at Pine Nut are somewhat astonishing, many arriving each day, but the population is not stationary, as a great many of the new arrivals are experts sent by syndicates in the East and California, who would not know gold or silver, unless it was coined, or whether the formation was igneous or aqueous. They might pick

up a handful of surface soil in a cattle corral, and through their sense of smell decipher its component parts. Pine Nut is but 25 miles from Carson City, a little south of east. Some of the claims are placer, but water is an unknown quantity in the locality. A dry washer is being worked by parties there with good results. The ore found is very rich, the rock showing a volcanic formation, resembling molten lava. The recent rich finds there have lent an impetus to the mining industry of Nevada, and Carson being the *entrepot* for the district, Pine Nut and its prospects form the principal topic of at the Capital city.

Pioche District.

MEN WANTED.—Pioche *Record*, Aug. 6: One hundred and fifty new men are wanted by the Pioche Con. M. & R. Company this month. Of this number, 100 must be practical miners who will be engaged here and in vicinity taking out ore from the company's various mines to have a good supply at the smelters when starting. Fifty additional men can find work along the line of the Jackrabbit railroad.

Oseola District.

NUGGET.—Eureka *Sentinel*, Aug. 8: A gold nugget weighing 53 ounces, besides the quartz, was recently found at Oseola. It is a small howler and only polished a little, indicating it had not traveled far. Some years ago another nugget was found near the same place, of the value of \$5000.

BRITISH COLUMBIA.

WAIT AT LEAST ANOTHER YEAR.—Nelson *Miner*, Aug. 3: Every mail brings letters of inquiry to the *Miner* from people who wish information regarding the Kootenay Lake country. To all these people but one answer can be given: At present there are at Nelson and Ainsworth as many business men and mechanics and laboring men as there is business or work for. Until the mines in Toad Mountain and Hot Springs districts are developed, there will not be business to warrant any large immigration to this section. People should wait at least another year.

REVELSTOCK SMELTER.—From passengers who arrived this week from Revelstock, the *Miner* gains the information that the smelter at Revelstock is doing good work, and that its owners and the resident manager are elated at their success.

IMMENSE LEDGES.—A. S. Farwell, who spent last month in surveying the townsite of Trail and mineral claims to Trail Creek district, returned to Nelson on Friday's train. He reports the ledges in that district of immense size and the country easily accessible. The principal claims are distant not more than six miles from the Columbia, and are not more than 2000 feet higher. But little work is being done, claim owners preferring to wait for purchasers.

ORE SHIPMENT.—The first shipment of ore from Hot Springs district arrived at Nelson on Sunday. It consisted of 514 sacks from the Number One mine, and was forwarded by the Columbia & Kootenay railway to East Helena, Montana.

DEVELOPMENT WORK ON THE SILVER KING.—To-day the owners of the Silver King awarded Robert Yuill a contract to do work that will go far to prove the value of that property. The main tunnel is to be extended 150 feet; a crosscut is to be run from the bottom of the shaft; and the ore body crosscut to several places.

CLEANUPS.—The Whitewater Co. has got the mill on Rover creek working finely, and Manager Davys reports that cleanups will be made regularly hereafter on the 1st and 15th of each month.

BELL WEATHER.—Amador *Ledger*, Aug. 8: The drifting operations at this claim, the property of S. W. Bright, of Jackson, have encountered the ledge. The quartz is considerably broken up and most of it is of low grade. About two feet is of excellent quality, estimated at from \$15 to \$20 per ton. The width of the ore body is only yet ascertained. The flow of water is still larger, and has increased materially since the ledge was struck.

BELMONT.—Tunnel No. 1 now is 380 feet. Plans have been submitted for bids on additional ten stamps. Mine is looking well, and at present two stamps running and doing good work.

MISCELLANEOUS.—The sinking of a shaft has been commenced at the Clinton Consolidated. Drifting at the North Star has reached within a short distance of the Comet claim. Crosscutting will be inaugurated, and if this should not develop anything encouraging, it is more than probable the property will be abandoned without entering the Comet ground.

SUTTER CREEK.—Water was turned on at the South Eureka last week, and sinking is now being energetically prosecuted. The new pipe gave no sign of leaking, and everything about the works is of first-class order.

IDAHO.

RICH ORE IN THE VENUS.—Wood River *Times*, Aug. 5: Vladislav Domske came down from the east fork of Wood River. He reports that exceedingly rich black sulphurates of silver were cut into yesterday at the Venus mine.

THE TRIUMPH TO SINK.—The Triumph Mining Co. is making preparations to resume sinking in its east vein. It will sink 200 feet below the crosscut from the bottom of the shaft before stopping again, and this will give it at least 300 feet of "backs" to open.

AT VIENNA.—Chris J. Johnston is to return to Vienna to a day or two. He has let a contract to continue the tunnel in the Vienna vein from the South Boise side, and will next ship a sample lot of the Mountain Kieg ore to St. Louis to have it tested by the various systems of concentration. While this is being done, he will procure a new steam hoist and pump for the Solace, in order to resume work there.

MONTANA.

AT BUTTE.—*Miner*, Aug. 7: Butte's principal industry—mining—has not been on the wane in this city during the past week. The same old-time activity is apparent on every hand, and additions to the long list of paying properties are being made every day. The Boston and Montana Co.'s mines and smelters are in operation, and under the able management of Capt. Thos. Couch, the company is reaping the harvest to which its enterprise entitles it. At the Lewis and Clark the new hoisting engine is being put in place. The task of putting to a

station at the 600-foot level is about finished, and on the starting of the new hoist sinking for the 1000 will be resumed. It is the intention of the Boston and Montana Co. to run levels from a depth of 1000 feet in the new shaft to the ground of the Mountain View and then to the Harris & Lloyd property, both of which belong to the company. Levels from this depth on the low ground will strike the Mountain View veins at a depth of 1600 feet, and the Harris-Lloyd at a depth of about 1400 feet. The scheme is a great one, and in addition to making a grand outlet for the ore, will supply fresh air to all the company's mines. The new shaft is to be supplied with a large Cornish pump, and it is the intention to have just fall enough to the levels from the Mountain View and Harris-Lloyd to permit the water from these two properties flowing to the new shaft, where it can be handled with ease.

BUTTE AND BOSTON.—The capacity of the smelter portion of the works of this company is now 400 tons per day, while the mill crushes about 75 tons more. The company's bullion shipped by the express offices of this city all comes from the mill, while that contained in the smelted ores goes out by freight in the shape of matte. The ore milled is taken principally from the company's silver claims on the hill, while that smelted comes from the Silver Bow, Ground Squirrel, Belle of Butte, East Gray Rock and West Gray Rock.

OTHER PROPERTIES.—Both mills belonging to the Alice Co. are running full blast, turning out more bullion than ever before. The supply of ore is coming principally from the Alice proper, but the Blue Wing and Magna Charta can be made to yield an unlimited quantity of ore if required to do so. Sinking was resumed in the shaft of the Alice during the early part of last week, and the work will be kept going until the 1500-foot level is reached, the 1400 having been passed.

LOWER CALIFORNIA.

CUSTOM MILL.—*Lower Californian*, Aug. 3: C. C. Lane has sold his mill in Alamo to J. O. Sheldon, who will operate a custom mill in the camp. Col. Lane retains the boiler, engine and rock-crusher of the mill, and if a favorable location can be found somewhere else in Lower California, he will re-engage in the business.

NEW MEXICO.

LONE MOUNTAIN.—Silver City *Enterprise*, Aug. 8: Lone Mountain, though not exciting any unusual commotion to the mining world at present, contains many valuable mining properties, some of which in the past were noted producers. While some exceedingly rich ores have been produced, the major portion of the mines are comparatively low grade. A few of the claims created a noise in the mining world, in years gone by, and may once more attract the attention which they deserve.

MAMMOTH MILL.—The Mammoth mill, at Pinus Altos, which has been undergoing extensive changes, is now ready to start up. The mill is complete in every detail, and is arranged to work ores at the lowest possible expense. The foundation was laid for 20 stamps, but only to were placed in position. The others will be added in a short time. The mine is well opened up, and capable of supplying an unlimited amount of ore.

GEORGETOWN.—Mineral was first found in this camp by Capt. McNulty about 18 years ago, since which time fabulous amounts of wealth have been extracted. This camp, as all others, has had its fluctuating periods, working at different times from 50 to 600 miners. At the present time, not more than 200 men are being employed.

GRANT CO.—The mine industry in Grant county is in a flourishing condition, and the output from the mines will eclipse all previous records.

COOK'S PEAK.—Silver City *Enterprise*, July 31: Lying upon the eastern slope of the Black Range mountains, near the southern extremity, is situated one of the most promising silver-lead camps in the Southwest. The camp takes its name from Cook's Peak, a prominent landmark which can be seen for 50 miles in all directions. The camp has been a producer for a number of years, but until within a few years no development work of an extensive scale had been attempted. The properties being all owned by poor men, work was conducted in a desultory way, until within a year or so ago several companies took hold of the different claims and opened them up systematically. All the mines upon which any considerable amount of work has been done have demonstrated to a certainty that large bodies of ore existed, and that they were of high grade.

WASHINGTON.

NEW PLACER DIGGINGS.—O'Kanagan *Outlook*, Aug. 3: A party of prospectors, consisting of C. C. Sands, Chas. Seibert, Will Hicks and R. H. Redmond, while camped in a gulch on the northeast slope of Palmer mountain one day last week, discovered gold in the gravel to which they were digging for water to cook their grub with. They washed some of the dirt and found it worth about 25 cents a pan. They immediately went to work and located four claims, or 80 acres, and are now busy prospecting to ascertain the extent and richness of their pay ground.

FIRST THOUGHT MINE.—We learn from Supt. Fisher that tunnel No. 3 has cut the vein at a distance of 645 feet. This taps the ledge at an average depth of 600 feet for the whole of the claim. The point where the tunnel has cut the vein is just beyond the north end of the north ore chute, which, on the upper levels, proved to be over 700 feet long. Before drifting south to explore this ore chute from No. 3 tunnel, an air connection with No. 2 level, some 210 feet long, has yet to be made. The work of sinking the air shaft has progressed already 60 feet, and the raise will be started next week. Streaks of good ore at the point of intersection give good encouragement that but a short drift will have to be run south before the main ore chute will appear.

A PARTY OF SURVEYORS.—Under the direction of Chief Engineer Mesab, has started from Sutter Creek to-day to run preliminary lines for the proposed Amador electric railway from Ions City to the several towns on the famous Mother lode of Amador county.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUG. 4, 1891:

- 457,101.—HOLOER FOR ARTICLES OF TABLE-WARE.—O. C. Amyot, S. F.
- 457,177.—BALING PRESS.—C. T. Anderson, Tampico, Wash.
- 457,244.—DEEP-WELL PUMP.—John Bean, Los Gatos, Cal.
- 457,103.—STEAM BOILER.—S. H. Benson, S. F.
- 457,108.—CAR COUPLING.—R. Clinton, Portland, Or.
- 456,941.—TRANSMITTING POWER.—Chas. Cummings, Oakland, Cal.
- 456,942.—ROCK DRILL.—Chas. Cummings, Oakland, Cal.
- 456,945.—PNEUMATIC DOOR CHECK.—A. Duden, S. F.
- 457,195.—SASH BALANCE.—S. N. Goldy, S. F.
- 457,269.—NECK YOKE.—Gothall & Pett, Astoria, Or.
- 457,049.—STAPLING MACHINE.—John Helm, Seattle, Wash.
- 457,092.—STUMP PULLER.—W. B. Morris, Seattle, Wash.
- 457,010.—WINDOW SASH.—M. E. Reilly, Montebello, Wash.
- 457,168.—WINDMILL.—R. B. Sinclair, Alameda, Cal.
- 457,235.—HORSESHOE WEIGHT.—G. Tompkins, San Leandro, Cal.
- 457,037.—CIGAR STANO AND HOLDER.—Vint & Goldberg, S. F.
- 457,018.—GAME.—Dormer Walsh, S. F.
- 457,176.—VAGINAL SYRINGE.—W. E. Weldon, S. F.
- 457,099.—LAWN SPRINKLER.—J. S. Woolsey, San Jose, Cal.

The following brief list by telegraph, for Aug. 11 will appear more complete on receipt of mail advices:

California.—Franklin W. Choate, San Diego, car-wheel and rail; Frederick W. Dohbel, Purisima, wagon brake; Henry P. Holland, assignor to J. A. Fleher, San Francisco, machinery for propelling vessels; Raodell Hunt, San Francisco, concentrator of sub-aqueous structures; William Johnson, Pomona, hose coupling; Edward C. Moulton, San Francisco, pea sheller; William S. O'Brien, San Francisco, eyon; Klaus Oleison, San Francisco, crutch; Edward D. Pike, San Francisco, detonating top; Isaac Smith, Foller, saw sets and axle; Warren Kyjoid and J. G. Burgess, San Diego, vehicle running gear; George A. Williams, assignor of one-half to F. Jones, San Francisco, heating attachment for gas burners.

Washington.—Charles T. Penninger, Prescott, trousers flap supporter.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FISHING-BOAT ATTACHMENT.—Pedro Costa, S. F. No. 456,720. Dated July 28, 1891. This attachment for the use of fishing boats, consists of booms adapted to project from the opposite sides of the vessel, means for attaching said booms and keeping them in place, and means for connecting the ropes of a net so that the latter may be kept open while towing behind the vessel. The booms at the sides of the vessel are like boat booms, and to the ends of these the lines of the net are connected, the lines being about 120 fathoms in length; and by reason of the distance between the outer ends of the boom, the net, which is towed behind the vessel, is kept open to gather any fish which may be encountered. By means of other lines the tow ropes of the net are brought into line with the stern of the vessel, when the net is to be hauled in. Winding drums furnish a means for readily drawing in the net so that it can be hauled aboard and the fish captured.

STEAM BOILER.—Samuel H. Benson, S. F. No. 457,103. Dated Aug. 4, 1891. The object of this invention is to provide a means for preventing the cold water, when first introduced into the boiler, from coming in contact with the highly heated parts of the fire-box and stay-bolts, whereby the latter are loosened and destroyed and the boiler caused to leak. A diaphragm or partition is fixed across the shell of the boiler at some suitable point between the inlet opening and the fire-box. It extends upward from the bottom and sides of the boiler sufficiently to prevent a current of cold water flowing directly along the bottom of the shell, but not high enough to prevent a free and rapid circulation of the water between the tubes. The plate or diaphragm to no case extends above the upper row of tubes, thus leaving several inches of water in depth above its upper edge and a clear space above the surface of the top tubes for the return of the water in its circulation. This enables the water to flow into the water-legs about the fire-box with sufficient rapidity without allowing the movement from the inlet to be too direct. The plate is high enough to give an upward turn to the water as it flows back, and by the time it has passed over the top it is warm enough to pass into the water-legs without injury to the plates or stay-bolts by undue cooling.

GAME APPARATUS.—Dormer Walsh, S. F., assignor of one-half to W. I. Davis. No. 457,018. Dated Aug. 4, 1891. This is a novel game to be played by two or more competitors. The apparatus consists of a table or cloth subdivided and having a central pit with an inclined surface leading upward thereto. Disks with numbers or characters are placed upon the table outside of the pit. Elastic cords are used having one end fixed to a supporting stand or frame and a ball is fixed to the other end, so that the balls may be used to shoot at the disks and impel them into the central pit. Each player endeavors to force as many of his disks into the central pit as possible and the amount of the figures upon the disks will determine his position in the game. The game may be played in many different ways, the most suitable being to

allow each player to shoot in turn and have each shot count as a shot whether a hit be made or not.

LAWN SPRINKLER.—John S. Woolsey, San Jose. No. 457,099. Dated Aug. 4, 1891. In this machine the direct action of the water upon certain floats within the rotary head, in addition to the reactionary force of the arms, causes the sprinkler to rotate with a less head of water than any form depending simply upon reactionary force, while the water will be thrown correspondingly farther.

Mining Share Market.

Comstock mining shares the past week were made quite active through cross-orders, so as to entrap the monied public, but it is not at all likely that the pools' efforts will be crowned with success, for bitter outside experience since the "Bonanza Firm" stopped active operations in the market, has taught them that the mines have been worked in the interest of a few persons, who, through accident or otherwise, obtained control of several mines for looting while making false deals in stocks to catch the unwary with assessments. Two of the "Bonanza Firm" have passed away, but two still remain, Senator Fair and Col. Mackay. The former appears to be engrossed in other pursuits, but the latter every little while returns to his first love, and when he does and gives strict personal attention to the mines in which he is reputed to be largely interested, he institutes some kind of reformatory work in the interest of outside shareholders. In 1886 he had the Jones' lease of Con. Virginia broken, and was mainly instrumental in showing up ore which paid regular dividends for many months. From that time up to a few days ago Col. Mackay has not apparently given much attention to the workings of his particular mines, but commencing with this month he is in active charge of them, and all reliable information points with unerring certainty that good results will follow. While this will unquestionably result, yet the monied public will hardly be drawn into dealing in the market until the serious charges preferred by the Mining Stock Association through the press in this State, and also at the East, are disproved, or else such reformations made in the mining and the milling of ore so as to conform to the laws of this State, which, briefly stated, are the making public of mine assays of all ore taken out, and from which levels, and all information of work being done in the mines, besides all ore run into, its assay, width, etc. Of course this also covers the honest milling of ores.

It is only reasonable to conclude that, judging from Col. Mackay's public record, this law has escaped his notice, and now that his attention is cited to it, he will give to it that attention, that keen sense of justice and right for which he is noted, and in doing so he will have the laws conformed to, so far as the official reports and the working of the mines are concerned. There is another thing the Mining Stock Association has openly charged, viz., that in milling ore, the bulk and the richest part is run off into slimes, etc., which are confiscated by a reported mill ring. These charges have never been refuted, and, so far as we know, no effort made to correct the abuse. Would it not be in the right direction for Col. Mackay to look into these charges—not only this, but have turned over the slimes, concentrators, etc., to be worked for the benefit of shareholders, and out, as heretofore, for mill-owners' benefit? He might also go still further, so as to disarm criticism. The miners might lease or buy the mills for their own use. With these abuses corrected, there will be no further necessity for an organization to fight for needed reforms. The past will be buried, and all join in the onward progress toward right and justice.

The following resolution was adopted by directors of West Con. Va. and Cal. Mining Co., July 29, 1891: It has been reported and is believed that the Con. Va. and California Mining Co. is now and for a long time heretofore has been running drifts into and extracting large and valuable quantities of ore out of the ledge belonging to this company without the consent of this company, and have applied the proceeds thereof to its own use. Be it

Resolved, That the president of this corporation be instructed to take all necessary steps to protect the property of this company, and to employ attorneys, and institute, in the name of the company, any and all proceedings necessary for the protection of the interest of the company, and particularly to take such steps as are necessary to procure a survey of the mine of the said Con. California and Virginia Mining Co. to ascertain the truth or falsity of said reports.

The share market opened this (Thursday) morning strong, but as yet very little interest is taken in the moves by outsiders. It looks as if the market will go higher, but of course breaks or setbacks must be expected, so as to induce trading. In outside shares, there is an entire absence of vitality. They appear to be orphans, no one willing to either father or mother them for a deal.

News from the Comstock mines is confirmatory of more energetic work, some in the right direction, but the most appears to be done to kill time and eat up assessments. Sierra Nevada is about ready to commence active operations to open up its grounds to the west, through the Kenosha tunnel. Good results are looked for. In Union, Mexican and Ophir, interesting and important work is being done. Con. Virginia is closely watched by dealers. Reports of improvements are afloat, which partially confirm what we have heretofore said. To a short time, full confirmation will come to hand. There is a growing belief that in Best and Belcher, a strike ought to be made within the next three or four weeks. Official and private advices from Hale and Norcross and Savage grow more interesting. In Chollar, on the 1100-foot level, the crosscut was not run far enough to cut the west ledge; but a small vein, four feet wide and assaying, so reported, about \$700, was passed through. In Potosi and perhaps in Bullion, it is claimed that west crosscuts have been started. If this is so, they ought, unless work is stopped, tap the lode lying to the west, which is rich in gold. The Milton mine, lying to the west, was worked in early days under Col. Mackay's superintendency, and very rich ore taken out. If they should happen to strike the downward continuation of the lode, quite a surprise would be in store for dealers. In Crown Point, work has been resumed to the west crosscut on the 500-foot level. In other gold hill mines, important work is under way, as are more assessments on the way.

MECHANICAL PROGRESS.

Flame Contact.

Some three years ago Mr. Thomas Fletcher, of Warrington, England, made a series of very interesting experiments, which showed in a most unmistakable manner, that notwithstanding when the most intense flame of holler furnace, or even blow pipe flame, was urged against the surface of any vessel containing water, there was always existing, between the flame and the surface of the vessel, an impenetrable cold zone or space. This extraordinary fact was quite new and unexpected, and is of the utmost interest and importance to steam-heaters and holler-makers. It was shown that a paper label will remain on the bottom of a tin or copper kettle placed on a sharp fire, until by drying, it gradually becomes loosened, and loses its contact with the metal, and so becomes burnt. Care, of course, must be taken that the paper and paste must be very thin, and the latter perfectly dry. Gnm will not answer, as it will swell, rise up and burn.

The important problem to be solved, is to discover what the actual temperature of this cool and flameless zone is, and whether this practically wet blanket can be removed. Efforts to remove it have been partially successful by the use of projecting studs, or webs of definite proportions. Experiments have shown that that flame contact can be made with the ends of copper rods or wires, four diameters in length, made to pass through a water-containing vessel into actual contact with water within. Paper placed upon the outer ends of such wires is soon charred. It has further been proved that the surface of the rods so presented to the action of flames is about six times as effective as the same area of surface on a holler or holler tube.

It has moreover been quite satisfactorily shown that the evaporating power of any properly proportioned studded or ribbed plate has no limit except the practical one of removing the steam quick enough to prevent it lifting the water bodily out of the boiler.

It was also shown in these experiments that not only the maximum temperature can be determined by the presence or absence of charring of known organic substances, but also the thickness or depth of the cold zone can be measured by using paper of different thicknesses pasted to the surface of the vessel. When the paper is thicker than the depth of the cold zone, the surface is charred or completely burnt to an invariable depth by each source of heat; but if this charred surface is cleared off, the under part will be found perfectly white and clean, and on again directing the flame on this clean surface, it remains untouched.

The experimenter, Mr. Fletcher, further says: "The cold zone, although impassable by flame, is powerless to resist the carrying of heat through it by solid bodies, and while the blow-pipe flame is being directed on the paper without the slightest effect, a wire passing through the flame and touching the paper will burn it instantly and completely, although the actual temperature of the wire must of necessity be far below that of the blow-pipe flame."

The extraordinary part of the whole series of experiments seems to be the existence of a zone of cold against all surfaces of metal having water behind them, this space being, to radiate heat and flame, almost as impenetrable as the metal itself is to the water. Some heat certainly does pass, or the water would never boil; but the quantity which does make its way through is very trifling as compared with what would pass, and, in fact, what does pass under such conditions as permit of direct flame contact with the metal.

The result of these experiments does not fit the ordinary accepted theories of radiation and absorption of heat. The fact is that the high temperature stops suddenly at a very clearly defined distance, the division line being sharply drawn. It cannot be said that the heat is absorbed at a sufficient speed to produce this cold zone, because, as a matter of fact, the heat rebounds and is dissipated, to a large extent, sideways, and this rebound takes place at an invariable distance from the vessel, irrespective of the angle at which the flame is driven, and depending only on the force of impact of the flame. If we could imagine the surface of the vessel covered with a layer of elastic material which is compressed by a torrent of small shot driven steadily against it, we get a mechanical representation of the actual state of things between a flame and a cold vessel, additional force of impact reducing the thickness of the elastic layer, but being powerless to annihilate it."

These experiments go far to account for the small amount of work actually realized from the combustion of fuel under a holler. The small results thus obtained have even been a problem, unaccountable by any rational theory of radiation or waste of heat in any other hitherto obvious manner. If an actual contact of flame with the surface of a holler, without any intermediate cool zone, can increase the work six times, as above stated, inventors have an economic problem of the greatest value to work upon.

The experiment of inserting wire rods was made by first drilling holes through a copper vessel and inserting therein wire rods so that they depended four diameters below the outer surface of the vessel, and flattened down with a broad head like a rivet, nearly level with the

inside surface. The theory connected with the utility of these rods is as follows: The lower ends of the rods, not being in close communication with the water, can, and do attain a temperature sufficiently high to admit of direct flame contact, and as their efficiency, like that of the water surface, depends on the difference between their own temperature and that of the source of heat in absolute contact with them. Thus a far greater duty must be obtained for such surface. The heat of the fuel is thus utilized to a much greater extent than by the imperfect flame contact with the ordinary boiler surface.

Of course there are drawbacks connected with the use of rods as described. Says the experimenter:

"To put such rods in a holler-plate necessitates the plate being drilled all over with holes, causing a dangerous source of weakness, as the rods cannot be used as stays; further than this, they would render really efficient examination a matter of extreme difficulty, and would be liable to give rise to frequent and almost innumerable leakages; but there is, fortunately, a very simple way to overcome this difficulty. I have found that rods or points, such as I have described, are not necessary, and that the same results can be obtained by webs or angle-ribs rolled in the plates. My experiments in this direction are not complete, and at present they tend to the conclusion that circular webs, which would be of the greatest efficiency in strengthening the flues, are not so efficient for heating as webs running lengthways with the flue, and in a line with the direction of the flame."

LEAD BURNING.—A correspondent of the *American Machinist* furnishes that journal with the following instructions on the very difficult art of "lead burning": "The art of lead burning seems to be very closely guarded, and few are taught it; in fact, it is made a sort of family affair, being handed down from father to son, through several generations. The process which I shall describe is for through burning, and not surface burning. The flame used is hydrogen gas mixed with air under pressure. This melts the lead on each side of the seam, and forms one piece of the sheets. Strips of lead are used instead of solder. To burn flat seams, such as bottoms of tanks, floors, etc., butt the sheets closely together, and under the joint place a strip of common brown or grocer's paper, about two inches wide, scrape bright for one-fourth of an inch on each side of seam, also scrape the piece of scrap lead, which should be about one foot long, one-half inch wide, and say, one-eighth inch thick, or the thickness of the sheet to be burned. Regulate the flame to the weight of the lead and let it play directly upon the seam, at the same time hold the piece of scrap in the flame, resting it on the lead, just at the seam; when the melt takes place, quickly withdraw the flame, and allow to cool down; when sufficiently set, commence again at a point just in advance of the solid seam. By these repeated meltings and coolings you will form a lead to lead joint, which is as strong as any other part of the sheet. To burn upright seams, which is the most difficult, commence at the bottom and burn upward, melting and cooling, as in the case of floor seams. When an upright joint is finished, it looks just as if it were shingled with round disks of lead, about the size of a cent, with about one-half the diameter of the disk to the weather."

The above writer describes a very carefully constructed apparatus which should be used, but which cannot be made intelligible without illustrations.

AMERICAN LOCOMOTIVES.—We have already made reference to the fact, so complimentary to American locomotive builders, that the government of New South Wales has recently ordered 27 locomotives from the Baldwin locomotive works of Pennsylvania. The *Australian-American* gives the reason for the preference of that government for American over English-built locomotives. That journal says: "American locomotives have had no easy road to travel in Australia, thanks to English opposition in the office, at the shops, and even in the cab. The order in question goes to a Philadelphia firm, and is based on the conceded advantage of American-built locomotives for climbing heavy grades and turning sharp curves. The freight locomotives are of the heaviest and strongest build, and with tender attached, will each weigh from 80 to 85 tons. The cost of the American-made locomotive is from \$8000 to \$12,000. Those destined for Australia will be sold to the government there for about \$10,000 apiece, the sale aggregating over a quarter of a million dollars. It is a "rush" order, and a special steamer will be ready to take the engines out when complete." This large order with the reasons for its being given to American builders, may be considered one of the greatest triumphs of American mechanical skill. It may be added here 12 locomotives were recently built for export to South America.

SINGULAR BUSINESS ENTERPRISE.—It is said that a steamer built at Bay City, Michigan, for the Pacific Coast trade, is now on her way to the ocean, via the St. Lawrence river. She is a steel ship of 2512 gross tonnage, with 1300 h. p. engines. Questions of cost largely figured in the selection of a building place on the Great Lakes for the vessel, and it is said that the Michigan builders stood ready to deliver her on the coast at a figure below the estimates of firms which launch their vessels in salt

water. Other vessels, it is announced, will follow her and will be dispatched to the Pacific Coast.

SCIENTIFIC PROGRESS.

Properties of Color.

The sun is, doubtless, the origin of all colors, as colors, with all their variations, are due to light. To us, color would have no existence if the eye and light did not exist to make it. Sound has no more to do with the eye than color has with the ear. Thus we see that both sound and color are the results of their conditions. Reflection is to light what echo is to sound, so that when light is reflected from visible bodies, it paints the image of those bodies upon the retina of the eye; thus we see them. In the autumnal season when we look across the landscape to the bordering forest with its green and yellow tinted foliage, how impressed we are with the transformation scene! At noon it is light and dazzling; in the evening, when the sun is lowering, it is somber and mellow. These effects are caused by the varying shades of light.

Newton was the first to discover the analysis of white light. He decomposed solar light, or rather common daylight, by means of a prism, or triangular piece of glass. To do this, he made a small, round hole in the window shutter of a darkened room. The aperture was large enough to admit of the necessary ray of light, which, passing through the prism, threw a prismatic spectrum on the blackboard placed to receive it. This spectrum was really an artificial rainbow, or solar spectrum. The solar spectrum is caused by suspended water in the atmosphere, or a rain-shower falling between the sun and the dark cloud which forms the background of the rainbow. The rain-shower acts as a prism. By means of a prism, Newton found that white light was capable of being broken up into its component parts, each part being a constituent of white light.

From such experiments it has been inferred that the sun's light is not homogeneous, but that it consisted of seven cardinal colors. These seven colors have different forms of refrangibility—that is, the prism through which the light passes bends some of the colors to a greater extent than others, giving each its respective place in the spectrum. From bottom to top, colors range as follows: Red, orange, yellow, green, blue, indigo and violet. Green, you will perceive, is in the center, and for that reason, perhaps, is the most universally agreeable to the eye.

From the arrangement of the colors, however, we see that red has the least degree of refrangibility, and violet the greatest, while green has the intermediate. Through the round aperture, used by Newton for the transmission of light, it was found that the colors overlapped or intercepted each other; but a German scientist, Kirohoff, experimented with a slit in the shutter, which he found gave a distinct and definite spectrum, free from the interceptions caused by the round aperture, and thus the color theory was definitely settled.

Natural bodies, such as flowers, plants, textile materials and all other bodies, of course, possess the power of extinguishing or absorbing some of the colors which enter them, reflecting others from their surfaces. This property of absorption is selective, and decides the color of the said plants and flowers, as also of painted or dyed materials. When the light which enters a body is wholly absorbed, the body is black, none of the seven colors being reflected, either combined or separate. The combined colors, when reflected in compounds, give tints which differ from the cardinal colors, such as pink and magenta, the latter being so called from its being discovered in the year of the battle of Magenta, 1859. A body which absorbs all the light waves equally, but not totally, is gray, while a body which absorbs all the waves unequally is tinted with various colors, hence the vast variety in the color of flowers. A body which gives back all the waves, without absorbing any, is white. Those constituents of white light, which bodies return to the eye, constitute their colors. A body placed in a light, which it is incompetent to transmit, appears black, however intense the illumination.

A stick of red sealing-wax, when placed in the vivid green of the spectrum, is perfectly black, and red cloth on which the red of the spectrum is permitted to fall, shows its color vividly, but appears black beyond that position. Indigo is largely used in dyeing. The indigo plant could itself be largely used for that purpose, but from 200 to 250 pounds of it would be required to produce the effect of a single pound of prepared indigo. The most important of red colors are produced from cochineal, a small insect found chiefly in Mexico, and from madder, the root of a certain plant, the former being used for woolen and the latter for cotton.

Indigo is distinguished from nearly all other coloring matter by its complete insolubility *per se* in water. Alcohol, methylated spirits and the like have to be resorted to as solvents, as indigo is largely used in dyeing. Let wool or silk be immersed at boiling temperature, in decoctions of any of the best known natural dyestuffs, such as cochineal, logwood, madder or quercitron bark, etc., and then washed in water, it will be found that the fibers of the

material are merely discolored or stained of no definite shade, hence the use of mordants.

The term "mordant" is found in Latin and Italian manuscripts of the twelfth and thirteenth centuries, as the name of an adhesive composition by the means of which gold leaf was attached to wood, marble and the like, but was latterly used for the decoctions used to give permanence to color in clothing materials. The chief mordants used in dyeing are salts of aluminium, of iron, tin, copper and a few other metals.

The purple dye is spoken of from earliest history, and the priests were distinguished from common folks by the colors of their garments, and other favorites wore coats of many colors, such as the Joseph who was sold into Egypt. We also learn from the writings of Pliny that the priests of Isis and Osiris in Egypt wore garments ornamented with purple trimmings, the colors of which were derived from a certain shellfish. By the aid of Pliny's records, this shellfish has been rediscovered, but the color derived from it is said not to be very brilliant. The ancients, however, may have had a better method of preparing it, for some of the colored threads found among the wrappings of Egyptian mummies distinctly show that the ancients of Egypt excelled in imparting colors to woven materials, and doubtless the Hebrews derived their superior knowledge of dyeing wool from the Egyptians.—*Fiber and Fabric.*

THE AGE OF MAN.—When was man first placed on earth? No one can answer that question. Hugh Miller says that man's habit of hurrying his dead out of sight makes it very easy to be mistaken on that point; for, because of burial, men's bones may be found among the animals that have lain in the earth for ages. There is one thing, however, that gives us an inkling of when he came. Certain tools, that only man could have made, have been found hurled in caves, in peat beds and in the bottom of lakes. Often these are covered by layers of rock, and by calculating how long it took to make the layers, a guess can be made as to when the tools were put there. Still it is only a guess, and no one pretends to regard that question as settled, because under some conditions the layers would be made much faster than under others; but the bones of certain animals, the mammoth and other great creatures of that time, which have long since died, have been found with these tools. By calculating in what ages these animals lived, and how long it takes a race of animals to die out, a surer result can be arrived at. In a cave in England, buried under a limestone layer from 1 to 15 inches thick, tools have been found mingled with the bones of elephants, tigers, rhinoceroses and hyenas, which roamed over that country thousands and thousands of years ago. The peat hogs of what is now Denmark and Scandinavia are filled with stone tools. Some have been found in beds of gravel, underlying peat which is certainly 7000 years old. This seems to show that man must have dwelt on earth at least as many years ago.—*St. Nicholas.*

THE MYSTERY OF THE STARS.—The fixed stars (so called) are not fixed, at least we know that great numbers of them have motions, which can be measured and defined by modern telescopes; hence it is naturally inferred that all are in motion. Motion seems to be one of the universal laws of nature. The moon revolves around the earth, and the earth, carrying the moon with it, revolves around the sun. Just so in a triple-star system we behold one star revolving around another, and the two together revolving around a third. The resemblance goes even further, for the smallest star of the three revolves around the second in size, and that in its turn around the largest. Stars are not only revolving around other stars, but they also have secondary motions through space. Many stars are approaching our solar system, others are moving away from it, and both motions are in various directions. Our own sun, with its attendant planets and their satellites, are moving in an apparently direct line through space. The line is apparently direct, but most probably the motion is curvilinear. The mystery of the motions of the stars must forever be an unsolved problem. They can no more be measured than can be the unlimited depths and vastness of space.

WOMEN IN SPECTROSCOPIC ASTRONOMY.—In spectroscopic astronomy, says a contemporary, the eye has been superseded of late to a great extent by the photographic plate, which is now able to recognize fainter impressions than the eye, and register them permanently. The instrument employed is a photographic telescope, with a prism, or a series of prisms, in front of the object glass, the whole mounted like any large telescope, and provided with an accurate driving clock. It has thus become possible to complete, in a comparatively short time, a general survey of the spectra of all the brighter stars of the northern hemisphere, and the survey is now being extended to the southern hemisphere, where it is already well advanced. Whenever the spectrum of a star, thus photographed on a small scale, is found to possess any interesting peculiarity, it is examined with a more powerful instrument, which photographs its spectrum on a much larger scale, and this second photograph is then enlarged again for special study. It is a notable fact that the examination of the Harvard photographs has been made almost entirely by women, who are assistants in the observatory.

GOOD HEALTH.

Apples as Medicine.

Chemically the apple is composed of vegetable fibre, albumen, sugar, gum, chlorophyll, malic acid, gallic acid, lime and much water. Furthermore, the German analysts say that the apple contains a larger percentage of phosphorus than any other fruit or vegetable. This phosphorus is admirably adapted for renewing the essential nervous matter, letholism, of the brain and spinal cord. It is, perhaps, for the same reason, rudely understood, that old Scandinavian traditions represent the apple as the food of the gods, who, when they felt themselves to be growing feeble and infirm, resorted to this fruit for renewing their powers of mind and body.

Also, the acids of the apple are of signal use for men of sedentary habits whose livers are sluggish in action; these acids serving to eliminate from the body noxious matters, which, if retained, would make the brain heavy and dull, or bring about jaundice or skin eruptions and other allied troubles. Some such experience must have led to our custom of eating apple-sauce with roast pork, rich goose, and like dishes. The malic acid of ripe apples, either raw or cooked, will neutralize any excess of obnoxious matter engendered by eating too much meat. It is also the fact that such fresh fruits as the apple, the pear and the plum, when taken ripe and without sugar, diminish the acidity in the stomach rather than provoke it. Their vegetable salts and juices are converted into alkaline carbonates, which tend to counteract acidity. A good ripe raw apple is one of the easiest of vegetable substances for the stomach to deal with, the whole process of its digestion being completed in 85 minutes.

Gerard found that the "pulp of roasted apples mixed in a wine-quart of fair water, and laboured together until it comes to be as apples and ale—which we call lamb-wool—never falleth in certain diseases of the rashes, which myself hath often proved, and gained thereby both cures and credit. The perling of an apple, out somewhat thick, and the inside whereof is laid to hot, burning or running eyes at night, when the party goes to bed; and is tied, or bound to the same, doth help the trouble very speedily, and contrary to expectation—an excellent secret."

A poultice made of rotten apples is of very common use in Lincolnshire for the cure of weak or rheumatic eyes. Likewise, in the Hotel des Invalides, at Paris, an apple poultice is used commonly for inflamed eyes, the apple being roasted and its pulp applied over the eyes without an intervening substance. A modern maxim teaches that "To eat an apple going to bed, the doctor then will beg his bread."—*London Hospital*.

SEASICKNESS.—Some one writes very sensibly upon seasickness, as follows: "Seasickness is a mental malady, in a sense, that is, it can be cured mentally. I have seen a whole mess of seasick persons cured in one minute by an alarm of fire. Sometimes ladies are cured by a steward spilling the soup in their laps. I have several times seen people fall over the rail when 'heaving up,' and when we fished them out of the water no trace of the complaint remained. The claim that it is good for general health is a humbug—a gross humbug. An emetic is a good thing in this time of onrs, when every one eats like a cormorant, and that far seasickness may do some good. Prevent it, you say! Well, in the first place, have nothing to do with doctors or their nostrums. Seasickness is not always alike, but generally begins with acidity of the stomach, and this acidity is the result usually of two factors, liquids and grease. The stomach is the greatest apparatus known for distilling fat acids—don't drink anything and eat no grease. When ill lie on your back, fore and aft ship, and swallow broken ice, slowly. I don't mean at first, but after a few hours when the stomach is sure to be inflamed and hot, while your hands and feet will be cold. When you get the boiler, I mean stomach, cooled off and empty, heef tea, broth if you can get it, cream, are suitable things to fill up on. The only medicine you need is some alkaline to correct acidity; calcined magnesia is best. For solid diet fat pork or old cheese."

MORE DANGEROUS THAN THE TARANTULA.—Truxton Davidson of Mission Valley, Tex., was bitten by a spider, inflicting a painful and dangerous wound. Dr. Boatner was called in great haste to the bedside of the sufferer and by the prompt application of remedies succeeded in relieving him of his pain. There is a small gray spider in this section whose bite is both painful and dangerous, at least two oases within the writer's knowledge having resulted fatally. It is about the size of a man's thumb-nail and may be distinguished by a wavy line of red or yellow that extends from its head down the center of its back the entire length of the creature's body. Its bite is far more dangerous than that of the tarantula or any of the venomous serpents except the rattlesnake. —*Galveston News*.

OLIVE OIL AFTER A BATH.—Any one can add strength and weight to his body by rubbing well with olive oil after a warm bath. Oil baths are particularly beneficial to delicate children.

THE WOOD WORKER.

Speed in Wood-Working Machinery.

A correspondent of the *Manufacturer's Gazette* writes as follows:

There has been a great deal written on this subject, but as it is one which admits of considerable argument, and every man has a right to his opinion, I thought it no harm to express mine, and hope others will follow the example.

The proper speed at which all kinds of machinery, and especially wood-working machinery, should be run is of great importance and concerns both the proprietor and the workman. As to the former, it means the greatest amount of good work in a given time, while considering the wear and tear upon the machine. No one will be foolish enough to think that it is profitable to force a machine to turn out a few dollars, or even cents worth of work, in a day, if by so doing the quality of the work and the condition of the machine are rendered less valuable.

And it is just here that the value of the operative's services and the degree of his skill are manifest. It is necessary that he should be able to judge as to the speed which a machine should be run to do its best work, and yet without strain or damage. If the machine is speeded too low, then it cannot do sufficient work to make its employment profitable.

Now there are certain laws and general principles which govern the speed of a machine for a given work, to do it profitably and economically. There are certain limits beyond which it is neither safe nor profitable to go.

No matter what is claimed by the manufacturer of a certain machine, there is a law which says that all bodies revolving around a common fixed center have a tendency to fly off in a line tangent to that center, and that force increases in proportion as the square of the velocity. Now, in calculating the centrifugal force of a revolving body, the diameter has to be taken at the center of gravity. In the case of regular shaped bodies, such as pulleys, fly-wheels, etc., the center of gravity is found to be very near the outward surface, and is very easily determined, and the centrifugal force may be calculated as follows: Multiply the square of the velocity in feet per second by the weight, and divide the product by 32 times the radius in feet at the center of gravity, which will give the centrifugal force in pounds.

Having ascertained this, it is a very easy matter to calculate the limit of safety at which a given body may be speeded to stand the strain exerted by this force, and in setting up machinery it is all important that these calculations be accurate.

There is too much guess-work in the average shop. Getting a pulley that is about right and near enough is poor policy, and is not only an injury to the machine, but an injustice to the maker, who guarantees it to do a certain amount of work under certain conditions, which cannot be guessed at and give satisfaction.

It is poor policy to employ poor workmen at any time or upon any occasion, but it is positively wasteful and disgraceful to employ a "blacksmith" to set up a new machine, and especially wood-working machinery, which admits of being run at a high rate of speed, but to which there is a limit of endurance and efficiency.

TO SAW TOUGH TIMBER.—All tough timber, when the logs are being sawed into lumber of any kind, whether scantling, boards or planks, will spring badly when a log is sawed in the usual manner, by commencing on one side and working toward the other. In order to avoid this, it is only necessary to saw off a slab or plank alternately from each side, finishing in the middle of the log. We will suppose, for example, that a log of tough timber is to be sawed into scantling of a uniform size. Let the sawing be done by working from one side of the log to the other, and the end of the scantling will be of the desired size, while at the middle some of them will measure one inch broader than at the ends. After the log has been spotted, saw off a slab from one side; then move the log over, and cut a similar slab from the opposite side. Let calculations be made before the second is cut off, so that there will be just so many cuts—no more, no less—allowing for the kerf of every cut. If the log is to be cut into three-inch scantling, for example, saw a three-inch plank from each side until there is a piece 6½ inches thick left in the middle. The kerf of the saw will remove about one-fourth of an inch. When a timber log is sawed in this way, the cuts will be of uniform thickness from end to end. Now turn the log down and saw the outside the other way, in the same manner, and the scantling will not only be straight, but of a uniform size from one end to the other, if the saw be started correctly.

"QUARTERED" OAK is made by sawing the oak log first into quarters, and then laying the round side down and sawing each quarter up into boards. This method of working up the log gives to the boards a peculiar figure in the grain that is lacking in oak prepared in the ordinary way by cutting the whole log up into strips.

USEFUL INFORMATION.

How Gold Is Shipped.

As few people realize the vast bulk of gold coin that is shipped annually from one country to another, and are unacquainted with the manner of shipments, the following from the *American Banker* will be interesting:

The Bank of America is the largest single shipper of gold from New York, and indeed from the United States. Shipments are made in stout kegs, very much like the ordinary beer keg. Every one contains \$50,000 in coin or bar gold. The latter is the favorite of these shipments, since the Government has permitted the Sub-Treasury to exchange coin for bar gold, as coin, in a single million dollar shipment, is liable to loss by abrasion of from eight to 20 ounces, or from \$128 to \$320; while the bars only lose about three-fourths of that value. Where coin is sent, double eagles are preferred. They are put in stout canvas bags, each containing 125 double eagles, or \$5000; and ten bags fill each keg. About the only precaution taken against tampering with kegs is a treatment of kegs' ends technically known as "red taping." Four holes are bored at equal intervals in the projecting rim of the staves above the head. Red tape is run through these, crossing on the keg's head, the ends meeting at the center, where they are sealed to the head by the hardest wax and stamped with the co-signor's name. The average insurance is about \$1500 per \$1,000,000. There is an expense of about \$2 per keg for packing and cartage aboard ship, or \$200 for the same sum and the inevitable loss by abrasion, whatever it may prove to be. The great Wall street firms ship from \$25,000,000 to \$40,000,000 annually. Some of these have for years insured themselves, and assert that the saving has been sufficient to replace a loss of \$1,000,000. These are large figures, but this has become a country of large figures and affairs.

The loss, by abrasion, on every \$1,000,000 in gold coin shipped across the Atlantic is said to be between one and two thousand dollars.

INGENIOUS MAKESHIFTS.—Ingenuity can extemporize the most unusual methods for attaining certain purposes. The Lounger happened into a rolling mill one evening last week and witnessed a novel feat in the beefsteak-broiling line which commended itself from sheer force of ingenuity. On the cooling bed, back of the rolls, lay a pile of red-hot iron which had just been rolled. The "heat" was over, and a brawny "rougher-up" began to prepare his supper. In a jiffy he had slipped a beefsteak on the hot iron, and by quickly turning it as often as once in five seconds, he broiled that steak to a nicety. This was equal to the makeshift of a hot-carrier at work on a Dearborn street building. When the noon hour struck, he rammed a handful of lime in a hole scooped in the sand, and sprinkling it with water, placed his dinner-pail over his flameless fire, securing a warm dinner and the open-eyed admiration of his amused spectators. —*Chicago News*.

TO PRODUCE GROUND GLASS.—The following process to produce ground glass has been recommended to me by a professional photographer. A cup is filled up to one-half with water, to which some emery powder is added. Stir well, allow to stand for about five minutes, and decant into another cup. Allow to stand again for five minutes, and decant the fluid into a third cup. In each of the cups remains a sediment of emery powder of various degrees of granularity. Take a well-cleaned glass plate, and commence to grind it with the coarsest grain; proceed with the grain of the second cup, and finish with the finest one. A semi-transparent glass plate of exceeding fineness is obtained by this method. —*Photo. News*.

THE PLEURO-PNEUMONIA IN ENGLAND.—The outbreak of this disease in the herds of the East Riding and the action taken by the Agricultural Department have caused quite a stir among the agriculturists of Yorkshire. The number of animals ordered to be slaughtered is 170. The slaughter is expected to occupy ten days in all, and the value of the beasts destroyed and to be destroyed is estimated at fully \$15,000, which will be paid by the Agricultural Department of the Privy Council. The outbreak of the malady is on a scale unprecedented in so small an area.

MONUMENTAL STRUCTURES.—The Boston cemeteries are said to contain no monument valued at over \$5000. Greenwood, New York's city of the dead, has memorials whose cost runs up into the hundreds of thousands.

THE LARGEST DEPOSIT OF SULPHUR on this continent is said to have been discovered in the Cocopah mountains, 75 miles southwest of Yuma. It is 1100 feet long, 60 feet wide and 40 feet through.

AN IMPROVED CASH REGISTER.—A cash register has been invented which, it is said, prints numbers and cuts off a check in one motion. The amount is, of course, registered at the same clock.

NASTURTIUMS PICKLED.—As soon as the blossoms are off, gather the little knobs; put them into cold water with some salt; move them about once a day for three successive

days; make a cold pickle of white-wine vinegar, eschalot, pepper, cloves, mace, nutmeg out in quarters and horse radish. Put the nasturtium buds into this pickle.

STEAM BOILER NOTES

KEEPING UP STEAM OVER NIGHT.—An engineer has been telling a contemporary how to keep up steam in a boiler over night without banking. First, the damper is closed tightly and ashes drawn to the ash-pit door, making it air tight. Then the smoke-box door is opened a trifle, the result being that the engineer had 15 to 25 pounds pressure in the morning. With a setting that is not full of leaks, it should be easy enough to keep up pressure over night without any fuss, and if not, there is some leak somewhere that should be attended to. The leak may be of steam, through faulty connections or in a cracked setting, letting the cold air come in contact with the boiler. Then some engineers have an idea that the top of the boiler should not be covered, and here is an avenue for the heat to escape. I have let the fire under a boiler go out early Saturday afternoon, and on Sunday afternoon have found 25 pounds pressure, and nothing was done but close the damper, furnace door and ash-pit door. The heat practices is to bank the fire, but when this is done, there is more fear of a pressure too high than otherwise. Any one who has a steam-pressure recorder will note that the pressure runs very high during the night, and passing through any of the city streets late at night, the hiss of steam escaping from safety valves is plainly heard, and leads to the suggestion that some may be in condition less responsive to the excess in the pressure allowed.

LIMITS OF STEAM EXPANSION.—The following extract from a circular issued by the English builders of a high-speed engine said to run satisfactorily at 700 revolutions per minute and to develop 200 horse-power, is interesting, since it attempts to confine the use of double and triple expansion to certain limits: If the boiler pressure always exceeds 70 pounds, it is worth while to use a compound engine; if as high as 150 pounds, a triple-expansion engine. If the engine exhausts into a vacuum, the corresponding pressure will be about one-fourth lower. The extent to which the steam may be expanded with advantage depends upon the boiler pressure. If the expansion is carried to more than a certain number of volumes, it is advantageous to divide it into two stages, i. e., to expand partly in a high-pressure or small cylinder or cylinders and partly in a low-pressure or large cylinder or cylinders. With still greater expansion, it is worth while to expand in three stages, i. e., in three successive cylinders of increasing diameter, and so on. But, although there are great practical and economic advantages in the system of expansion in successive stages, there is no essential difference in principle between expanding, say eight times, in a series of three cylinders, with comparatively late cut off in the first or smallest one, and expanding eight times in the largest of the three only, with the steam admitted to it direct and out off at one-eighth stroke.

MANAGING SAFETY VALVES.—An engineer, speaking of neglected safety valves, said: "Safety valves that stick will stick even though tried every day, if they are simply lifted and dropped to the old place on the seat again. If a boiler should be found with an excessively high pressure, it would be one of the worst things to do to start the safety valve from its seat unless extra weight was added, for should the valve once start, it would so suddenly relieve the boiler of such a volume of steam as would cause a rush of water to the opening, and by a blow just the same as in water hammer rupture the boiler. Such a condition is very possible to occur of itself when a safety valve sticks. The valve holds the pressure, that gets higher and higher, until so high that the safety valve does give way and allows so much steam to escape that the sudden changing of conditions sets the water in motion, and an explosion is the result."

IN PACKING the stuffing boxes of piston rods and valve rods, the utmost care should be taken to put in the packing evenly, so that the steam may be prevented from seeping without the necessity of screwing down the glands so tightly as to interfere with the free movement of the rods. The packing should be changed as often as may be necessary to prevent it from becoming hard and gritty, as keeping it too long in use may be the means of grooving or creating the rods, thereby occasioning leakage and consequent trouble.

CYLINDER LUBRICANT.—Too many engineers behind the times still use tallow as a cylinder lubricant, and by so doing run a great risk of eventually destroying the engine, as the several fatty acids, stearic, oleic, margaric, etc., of which tallow is composed are almost sure to eat out the valve seat, piston rings and other parts of the cylinder. Some good mineral oil should be used, which is known to have a reputation.

A HIGH PRESSURE ENGINE runs by the direct pressure of the steam only. In a low-pressure engine, the steam is condensed with water or otherwise, and a vacuum formed in front of the piston, adding from 13 to 14 pounds per square inch to the power of the piston.

Passing Events.

The Pine Nut excitement, Nevada, still continues, but as yet little is known of the veins. There is only one claim thus far that shows large prospects, and its owner is very mysterious about it, prohibiting all examination by other miners. He claims to have taken out several thousand dollars. Numbers of prospectors are working in the district testing other prospects.

The Golden Gate river mine, on the Feather, is now ready for operation, the river having been turned into the flume. The pumps are being rigged to remove the pools in the river bed, and in a very short time they will know whether the river bed is as rich as supposed. This is an exceptionally good season for river mining, the waters in the streams being very low.

A prominent mining company in this State has commenced suit against certain interior merchants for buying gold alleged to have been stolen from the mine by miners working in it. This is a new move and will be apt to make gold-dust buyers careful in their purchases. Suits have been commenced also against some of the miners.

The reports of earthquakes in Lower California appear to be greatly exaggerated. Some severe shocks have been felt in the region about the head of the Gulf, but no great damage has been done.

Early Favors Appreciated.

Subscription receipts have been slow in June and July. Now, as the season has advanced, will not our subscribers, more or less in arrears, pay up to date and a year in advance? We can give them all the better issues for prompt payment, and will thank them besides. Try and get your neighbor to take our paper, and we will give him cause to rejoice at its many good visits.

Expenses Per Ton of Ore.

The Alaska (Treadwell) gold mine, Douglas island, Alaska, which we mentioned last week as having the largest gold-milling plant in the world, produces and mills 600 tons of ore per day. During the year, ending May 31st, the company's receipts were \$790,001.71, of which \$18,977.19 was from the store. The ore crushed aggregated 220,686 tons, yielding \$3.58 per ton. Operating expenses subtracted, the net revenue was \$418,208.90, of which \$200,000 was paid out in dividends.

Some of the figures from the report of this company are of general interest to miners. The expenses per ton of ore were divided as follows: Mining, 220,686 tons—labor, \$0.4555; supplies, \$0.2495; total, \$0.7050. Milling 220,686 tons of ore, 5,777 tons of concentrates being saved—labor, \$0.1940; supplies, \$0.2266; total, \$0.4206. Chlorination of concentrates—labor, \$5.0312; supplies, \$3.9852; total, \$9.0164 or \$0.2193 per ton of ore. General expenses, including salaries, interest, exchange, insurance, hospital account, etc., \$0.0804. San Francisco office expenses, \$0.0239. Bullion charges, \$0.0528; total operating cost, \$1.5020. Legal and other expenses of incorporation of company, \$0.0286 per ton of ore; construction account, \$0.1540 per ton of ore; total cost of operating and construction, \$1.6564. The yield per ton of ore was \$3.58, the net profit being \$1.90. In 1885, from August to December, inclusive, the ore yielded \$7.02 per ton. In 1886 the average yield was \$4.03; in 1887, \$4.40; in 1888, \$3.55; in 1889, \$3.04, and in 1890, \$3.58.

This shows that the cost of mining was 70 cents, and of milling 42 cents per ton. The total operating cost was \$1.50 per ton of ore. Including these with construction and operating expenses, the cost was such as to permit a profit of \$1.90 per ton on ore which yielded \$3.58 per ton. This shows cheap working and proves what can be done with low-grade ore. It was no small batch of ore either, but over 220,000 tons were mined and worked in the year.

The North Fork District.

When the boundaries of the Yosemite Reservation were recently enlarged to preserve the timber and maintain the water supply, the lines took in the North Fork mining district, where prospectors were at work before the last Act of Congress was passed. There are no natural curiosities or wonders in the district, but it is supposed to contain valuable mineral ground. Miners who have attempted to work on the ground have been driven off by U. S. troops in charge of the reservation.

The miners are endeavoring to have the laws amended so the boundaries of the reservation will exclude the mining district. They have applied to the State Mining Bureau to endorse the appeal to Congress to change the law. State Mineralogist Ireland will send an expert to examine into the mineral character of the region, and if the facts are as represented, will endorse the appeal.

It is not at all probable, however, that Congress will change the law establishing the boundaries of the reservation because the miners want to work ground there. The Government departments generally, as well as the Government courts, seem to be unfavorable to the mining industry, and pay little attention to the demands of miners. Railroads, capitalists and agriculturists have money influence or votes, and are apt to get what they want from Congress. The miners have no association or alliance of any kind to enforce attention, so their demands meet with little favor. As to Mining-Bureau influence, it had a very close call to get recognition from its own State Legislature, and what it can do with Congress is problematical. A good, smart, influential Representative or Senator from this State, with the slightest interest in the miner or mining industry, might straighten the matter out favorably, but we have little hopes under present conditions. The miner need expect little aid from either our Legislatures or Congress.

Milling Comstock Ores.

Official figures show that from the Comstock mines in the last quarter, 56,430 tons of ore were extracted. The gross yield was \$934,274; cost of extraction, \$464,274; cost of transportation and reduction, \$365,244. The Cons. Cal. and Virginia made a profit of \$218,049 from 25,940 tons of ore, and the other eight mines made an aggregate loss of \$113,440 in the quarter. Savage lost \$6931 in 7030 tons of ore; Ohollar lost \$19,284 on 6930 tons of ore; Overman, \$33,790 on 7813 tons of ore; Yellow Jacket, \$21,434 on 4973 tons; Justice, \$11,511 on 1139 tons of ore. It cost the Challenge \$11,980 to extract 431 tons of ore, the gross yield of which was only \$6499, and they paid \$3020 for working it. Confidence got out 780 tons, which yielded \$11,924, but it cost \$13,032 to extract it, and \$5460 to pay transportation and reduction. Justice took out 1139 tons at a cost of extraction of \$20,649, and the gross yield was \$17,113 and \$7975 for reduction and transportation.

The Cons. California and Virginia paid a hullion tax of \$10,575 to the State of Nevada, but none of the others had to pay any tax, there being no profit. For the first quarter of the year, these same mines, with the addition of Crown Point, produced 44,044 tons of ore, valued at \$652,732, or an average of \$14.82 per ton.

For the fiscal year ending June 30, 1891, 15 Comstock mines produced 236,599 tons of ore valued at an average of \$14.50 per ton, or \$3,430,621 in bullion. Among these, Cons. Cal. and Va. produced 89,429 tons of ore of an average value of \$17.25 per ton, equal in hullion to \$1,543,311. For the preceding year, the average of 266,097 tons of ore was \$15.90 from all the mines; and in the year before that, the average of 266,611 tons was \$19.21 per ton. The average for the last fiscal year was the lowest in five years.

With one exception none of these mines have been paying dividends, or even expenses, with the grade of ore extracted. Most of them have been losing money right along. The high cost of mining incident to deep work, prospecting operations, etc., and the extreme cost of hauling ore and milling it prevent any profit being made. As a contrast to this may be mentioned, the figures given elsewhere in this issue of the cheap work being done in the Alaska gold mine, where they are paying dividends on ore worth only \$3.58 per ton.

The product of the Daly mine, Utah, for the first seven months of 1891 was as follows: \$220,195.44 from the sale of sulphides, and \$135,543.65 from ore sales. Seven regular monthly dividends of 25 cents each per share, aggregating \$262,500, have been paid the present year. Total dividends to date, 53, aggregating \$2,025,000.

The product of the Ontario mine, Utah, for the first seven months of 1891, has been as follows: 533,540 ounces of bullion, and \$376,169.60 from ore sales. Regular dividends have been paid each month of 50 cents per share, aggregating \$525,000. Total dividends to date, 182, making a grand total of \$12,025,000.

NEW BAG MILL AT THE PRISON.—At the last meeting of the State Prison Directors, plans, with a synopsis of specifications for the proposed jute-mill at San Quentin were submitted by P. A. Humbert, who advises the erection of a mill of 200 looms, costing \$139,645. The plans were approved.

WM. A. BOLINGER, a pioneer miner and merchant, died at Independence, Inyo Co., two weeks ago. He was formerly engaged in extensive quartz-mining enterprises in Plumas county, and more recently in Inyo county.

THE assessed valuation of the mining claims of the Sierra Buttes Co., at Johnstown, Plumas county, were reduced this year by the assessor \$90,000 below last year's estimate.

CALISTOGA quoksilver mines shipped 807 flasks last month—an exceptionally large amount. Judging from shipments, the mines are in a flourishing condition.

New Excavating Machinery.

A Successful California Invention.

The contract for the excavation of the main canal of the Central Irrigation District, from Sacramento river to Stony creek (a distance of about six miles), was let to the San Francisco Bridge Co. on October 10, 1889. This contract involved the excavation of about 1,250,000 cubic yards, this section having an average depth of about 15 feet, while in some places it is 19 feet 6 inches deep, with a bottom width of 60 feet and top width of about 100 feet.

The contract price was 17½ cents per cubic yard. The bid of the Bridge Co. for this work was about \$30,000 lower than that of any of their competitors. It was the only firm of contractors who figured on doing this work by machinery; the other contractors estimated on doing it by the old method of scrapers and horses.

The machine, a photo-facsimile of which is herewith presented, was conceived, invented and designed by the Bridge Company for the carrying out of its contract, and it has proved remarkably well adapted to the work and in every way a success. It would have been absolutely impossible to have excavated this ditch in the old way with scrapers, owing to the presence of water, which in the summer months stood about two feet deep in the ditch, and in the winter months was often as deep as five to seven feet. The designers of the machine anticipated this condition, and ingeniously arranged the machine to rest on the original ground at the foot of the spoil bank at the top of the ditch, and not on the bottom of the ditch, as steam excavators usually do.

A standard-gauge railroad track is laid on either side of the ditch, as may be seen in the cut. On each of these tracks are located three very heavy railroad trucks, similar to flat cars, only shorter. On these trucks are rested the three tines that span the ditch and carry the car which runs on double-track standard gauge, and on which is located all the excavating and transporting machinery, as shown in the illustration.

The cars on the tracks on either bank are moved forward eight or ten feet at each shift by means of wire ropes worked by steam drums, fastened to "dead-men" or anchors fixed in the ground 100 or 200 feet ahead of the machine; then the excavating chain and hockets are lowered by means of another steam gipsy until the hockets come in contact with the ground, and the car is started across the transverse track by means of another steel cable worked by a steam drum, and the hockets, as the machine passes transversely across the ditch, takes a cut off the top of the ditch of the whole area of the eight or ten feet which the machine moved forward; and when the machine arrives at the outer side of the ditch, the boom is again lowered and the car started back and another cut is excavated by the hockets. This operation is repeated until this section of the ditch is taken out clear to the bottom; then the ladder is raised by a steam drum so that the hockets clear the ground, and the side cars are again run ahead, another "fleet" of eight or ten feet is made as before, and the hockets are again lowered until they come in contact with the ground and the car started on the transverse track again. The hocket dump or discharge into a hopper, the bottom of which is inclined and reversible, and the material after falling into the hopper falls down over this incline bottom, which delivers it on to the rubber-helt conveyor which carries it to the spoil bank.

When the machine passes the center of the ditch, the bottom of the hopper is tilted to the other side and the material is thrown onto the other conveyor, which delivers it on the opposite bank. All these movements of the machinery are controlled by one lever man, who may be seen in the cut, standing on the platform, on the right-hand side. He has control of five separate levers: one for raising and lowering the bucket chain, one for moving the car to the right, another for moving it to the left, and another for moving it forward on the side tracks, and the fifth controls the engine. The rapidity and facility with which all these movements are made is surprising, especially when you take into consideration the momentum and immense weight of the car holding the excavator's machinery, which is about 300 tons. As the machine excavates the ditch, the track is

BLAST FURNACE AT FRIEDENSHUTTE, UPPER SILESIA. See page 99.

Good Building Rock.

The fact that the writer has been asked to pass judgement upon the value of many specimens of stone for building purposes, and that to the majority of the questions, a negative answer has had to be given, leads the writer to the opinion, that a very great number of people have wrong views upon the value of such rocks.

It is a fact by no means universally known, that rock which may appear fair to the eye is not all fit for building purposes. Many points have to be taken into consideration, and for safety as well as for economic reasons it is best to have a thorough test of the rock. The points mentioned below, are not by any means the only ones that would be considered by a chemist or economic geologist, but if carefully observed much useless expense, as well as much time and labor, may often be saved.

There are essentially two classes of qualities which may fit stones for various building purposes. First, strength and durability, which may be called necessary qualities, and second, facility of working and heavy, which may be called desirable qualities.

In the first place it is, of course, evident that the rock must have sufficient strength to withstand any strain to which it may be subjected, and must also possess qualities that will enable it to resist the usual agencies of decay, otherwise it must be rejected as wholly unfit for use in any important structure.

There are several points upon which the strength of a rock depends. A compact texture is very essential, and the value of a stone for building purposes, other things being equal, is largely in proportion to the compactness. It is essential that the grains of the stone touch each other in many points, that they may mutually sustain each other.

The second point of consideration is the degree and manner of consolidation. The cementing material must surround the particles well and fill all spaces. The intrinsic hardness, particularly if the rock is of felsitic crystals, bears largely on its value. The smaller the size of the grain, and the finer the texture, the more varied will be the direction of possible cleavage, and hence the less it will be liable to yield to a crushing force.

The durability is affected by the various conditions under which the stone may be placed, but attention will be directed only to those of the greatest importance and such facts as can be easily observed.

1. Sufficient consolidation, which has already been mentioned as a condition of strength, and this is also the more important in rock which lacks the second requisite.

2. Density, which is shown by the relative imperviousness of stone to water. If the rock seems quite porous it must, in any case, show undoubted proof of durability before being placed in any large structure.

3. Fineness and uniformity in the size of grains has a very decided influence on the durability of rock.

4. The presence of impervious minerals, of which iron pyrites is the most common, and also the most to be feared. It is even the more dangerous when disseminated throughout the rock in very fine crystals, and nearly imperceptible. Iron also occurs very commonly in the form of a carbonate, and after as a protoxide, which have a tendency to pass to a higher state of oxidation, especially in bluish or gray sandstones. In some sandstones, reddish or brown, even the cementing material may be iron oxide.

5. The presence of clay is to be looked upon with great suspicion, for it acts as a great retainer of moisture and hence is liable to cause great damage.

Good building rock on this coast is of great value and particularly in the north Pacific States, but many are disappointed in receiving an unfavorable report from a chemist. If the above-mentioned facts are borne in mind, a clew will be had to the advisability of having further tests made. In themselves they are not sufficient, but in nearly every case, if a stone answers the above requirements, it would be advisable to have it further examined.

G. W. S.

THE largest shipment of Mexican dollars went out on the last steamer for China that has been made for over one year. It aggregated nearly half a million dollars.

taken up behind and relaid in front, leaving the berm of the original ground between the toe of the spoil bank and the top of the ditch. In 15 foot cutting, the distance from the bottom of the ditch to the top of the spoil bank is about 33 feet. The cost of the machine was about \$60,000, and its output is from 80,000 to 90,000 cubic yards per month. It is now on the last section of the work, and will complete the contract in about five months.

The production of this machine was certainly a bold and original conception. It stands

unique and without parallel or approach in the history of steam excavating machinery—in this or any country.

The builders deserve great credit for their faith in the idea, and the pluck and courage which they displayed in spending so large an amount of money in the production of this machine, which was experimental. Their enterprise was amply rewarded by the grand success of the invention. The machine was built under Letters Patent dated, May 4, 1886, September 9, 1890 and December 23, 1890.

About 150 miners are at work on the Forty-mile placers, Alaska. The product this year is expected to be about \$50,000. Some miners make from \$1000 to \$1400 each, while others make but \$200 or so. Provisions are high. Flour is worth \$15 a hundred pounds, raisins 37½ cents a pound, matches 25 cents a bunch, hoon 40 cents, beans 25 cents, butter \$1.50 a roll and coffee \$1 50 for a three-pound can.

THE mining dividends paid in Montana since January 1st of this year aggregate \$2,729,200.

**A COMPLETE TREATISE
ON THE****Electro-Deposition of Metals**

Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Imposition Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, Proprietor of a Manufactory for Chemical Products, Machine Apparatus, and Utensils for Electroplaters, and of an Electroplating Establishment, in Leipzig. With additions by William T. Brann, Editor of "The Techno-Chemical Receipt Book." Illustrated by 125 engravings. In one volume, 8vo, 404 pages. Price, \$4.00, free of postage to any address in the world.

ABSTRACT OF CONTENTS:

I.—GENERAL HISTORICAL PART. Chapter I. Historical Review of Electro-Metallurgy. II.—THEORETICAL PART. Chapter II. Magnetism and Electricity; 1, Magnetism; II, Electricity; Electro-Magnetism; Induction; Chemical Actions of the Electrical Current. Chapter III. Galvanic Elements; Thermopiles; Magneto and Dynamo-Electric Machines. (a) Galvanic Elements; (b) Thermo-piles, (c) Magneto and Dynamo-Electric Machines IV.—PRACTICAL PART. Chapter IV. Arrangement of Electro-Plating Establishments in General; Electro-Plating Arrangements in Particular. V. Treatment of the Metallic Articles; (a) Mechanical Treatment; (b) Chemical Treatment. VI. Processes of Electro-Deposition. VII. Deposition of Nickel and Cobalt; 1, Nickeling; 2, Cobalting. VIII. Deposition of Copper, Brass and Bronze; 1, Coppering; 2, Brassing (Cuprepol) Deposition; 3, Bronzing. IX. Deposition of Silver. X. Deposition of Gold. XI. Deposition of Platinum and Palladium; 1, Deposition of Platinum; 2, Deposition of Palladium. XII. Deposition of Tin, Zinc, Lead and Iron; 1, Deposition of Tin; 2, Deposition of Zinc; 3, Deposition of Lead; 4, Deposition of Iron (Steeling). XIII. Deposition of Antimony, Arsenic and Aluminium; 1, Deposition of Antimony; 2, Deposition of Arsenic; 3, Deposition of Aluminium. XIV. Galvanoplasty (Reproduction); 1, Galvanoplastic Deposition in the Cell Apparatus; 2, Galvanoplastic Deposition by the Battery and Dynamo Machines. XV. Coloring, Plating, Oxidizing, Etc., of Metals—Lacquering. XVI. Apparatus and Instruments. XVII. Hygienic Rules for the Workshop. XVIII. Chemical Products Used in the Electro-Plating Art; 1, Acids; II, Alkalies and Alkaline Earths; III, Sulphur Compounds; IV, Chlorine Compounds; V, Cyanides; VI, Carbonates; VII, Sulphates and Sulphites; VIII, Nitrates; IX, Phosphates and Pyrophosphates; X, Salts of the Organic Acids. XIX. Useful Tables. Index.

A circular of 6 pages quarto, giving the full Table of Contents of this important Book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO.,INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,
810 Walnut St., Philadelphia, Pa., U.S.A.**Giant Powder Fuse Cap Fastener.**

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mines. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, \$2 each, or the three instruments furnished in gold plate, \$3. N. W. MOODY, Fresno, Cal.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented Oct. 8, 1889, and Dec., 1890.

ANGELS, CALAVERAS COUNTY, Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON GARRARD,
Supt. Gold Cliff Mine.

HELENA & IDAHO GOLD MINING CO., SUPERINTENDENT'S
OFFICE, GIBBONVILLE, IDAHO, Oct. 8, 1890.

MR. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting, and the other one is all ready to start. They were so easy to set up and run that I forg't all about the "letter of instructions" until they were set up and running and you recalled to my mind your letter and instructions. Yours truly,
MYRON E. RODGERS, Supt.

ANGELS, CALAVERAS Co., Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours,
T. M. LANE, Supt. Madison Mine.

ANGELS CAMP, July 25, 1891.
MR. JAMES TULLOCK—Dear Sir: We are working sulphurets from mines in Calaveras and Tuolumne Co's. We find the sulphurets saved on your machines cleaner than those saved on any other. Yours truly,
THOS. N. SMITH, Supt. Utica Chlorination Works.

Price, \$450.

An Electric Coal-Cutter.

We give herewith an illustration of the electric coal-cutter made by the Edison General Electric Co. of New York and 112 Bush St., S. F. In this machine the under-cut is made by revolving tools, the axes around which they revolve being either a horizontal line parallel with the coal (outter bar) or a horizontal line at right angles with the coal (augers) or a vertical line (chain machine). The machines generally consist of a stationary bed upon which slides a movable frame bearing the cutting devices.

The latter is gradually fed into the oval as the knives or tools cut the oval away in front of it. The electric motor is attached to the movable frame or to the stationary bed, suitable gearing or chains transmitting the power to the cutters. The feed is automatic. The coal is generally undercut, the cutters making a groove in the coal the entire length of the bar. The motor used on this coal-cutter is capable of giving 15-horse power when doing steady work. This motor is specially adapted to the work it has to perform. It runs entirely without sparking, and has all its vital parts well protected.

EDISON ELECTRIC COAL-CUTTER.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Amador County Mines.

(From our Travelling Correspondent.)

Irishtown.

The principal mines of this section are those of the Clinton Cons. which are 6½ miles northeast of Jackson. The Clinton mines are under the superintendency of Mr. J. B. Francis. The properties consist of the Clinton quartz mine, the Pangh, Pangh Extension and Union mine, covering 3000 feet on the strike of the vein, and with other land purchased, about 700 acres of ground. The three ledges on the Clinton Cons. are ore-bearing by a main tunnel 1000 feet long, which taps the veins 260 feet deep. In addition to the tunnel a three-compartment shaft has been started on the Union ledge. From this shaft crosscuts will be run to cut all of the veins. Between the two ledges of the Union is a porphyry dyke 60 feet in width, forming the footwall of ore and the hanging wall of the other vein. As depth is attained these two ledges out and will no doubt, in time, entirely displace it. The country rock is slate. The veins on the Union are the southeast vein, 3 to 6 feet in width and the northwest vein, 3 to 36 feet in width. All of this is milling quartz, carrying from \$4 to \$7 a ton in free gold, and 2 per cent of sulphurets of from \$40 to \$80 a ton value.

On this property the company have a 20 stamp mill of 1000 pound stamps, the mill crushing, 75 to 80 tons daily. The power is water under 365-foot head. They use a six-foot Pelton wheel; and have also a two-foot Pelton motor. In addition to the mill the property has a large boarding house, sleeping house and a number of residences in the course of construction. The Clinton also own the Maeto mine which adjoins and are about consolidating it. This is opened by a 200-foot tunnel, cutting the vein 120 feet deep. The vein runs from 4 to 40 feet in width of ore that averages \$2.50 a ton in free gold. In addition to this, there is a large amount of high grade ore, which is soaked and shipped for treatment. The mine has a 10-stamp mill. The Clinton Co., are carrying out the most extensive system of operations of any mine in the county, and in addition, will put in 10 more stamps, a chlorination plant and in all probability, an electric plant in the immediate future.

The Reed & Askey.

The Chapmans have taken hold of this old mine and have driven a tunnel and shown up a four-foot vein of good ore that they are now dropping 10 stamps on.

Leaving Irishtown, the drive down to Jackson is one to be remembered. If the reader has never been "given a fair shake," he should take a drive over that road and he will more than get it, if his rig don't break down.

Jackson.

The Casto mine, generally known as the Hardenburg, on the west bank of the Mokelumne river, three miles south of Jackson, on the mother lode. The vein is opened by shaft to a depth of 500 feet, with drift run 389 feet on the vein, which averages three feet in width. The mine has a ten-stamp mill running steadily to test the ore of the mine. At this time the mine is being developed under bond.

The mines of the Amador Gold Mining Co., although splendidly equipped, are idle, with no indication of their being operated.

The Zeile.

The Zeile, W. F. Dieter, superintendent, is now down 1160 feet and is crushing three tons a day to each of the 40 stamps. The ore is from a 25 to 40-foot vein. They chlorinate their own sulphurets. The Zeile pays because the superintendent wills it, so if the ore was but half its present value, I don't doubt but Mr. Dieter would find a way of making it pay its way. The superintendent of one of the largest mines in the county said to the writer: "Mr. Dieter is my book of reference; he has everything down to a hair, and no one figures as close."

It has not been Mr. Dieter's good fortune to have a high-grade proposition to turn out big dividends from, but he has made a record as a successful manager where all others failed. This marks him as a superintendent of exceptional business ability, in addition to his mining knowledge.

The Kennedy.

The Kennedy, J. Parks, superintendent, is now down 1350 feet, with the vein running from one to five feet of high-grade, free-milling ore that keeps the 40 stamps at work. The mine is keeping up its record as a billion producer and is to-day paying the largest amount in dividends of any mine in the State. This information is not from the superintendent, who is noncommittal, but from the friends of the fortunate stockholders.

Mr. D. G. Gates is running his blanket system of concentration below the Kennedy mill. Although the mill is equipped with concentrators, Mr. Gates catches what fine, high-grade sulphurets are carried off by the sand and water. The quantity and quality speak well for his method, which is the best arrangement of blankets in use. In addition, Mr. Gates has in operation a concentrator of his own construction for re-concentrating his sulphurets. This differs from other concentrators in this: that the feed comes on all along

one edge of the belt through a trough, which sizes the sands as well.

The vibrating motion of the table causes the sands to travel forward, while the incline gradually sends the flow across down the side as well as the end of the table. By this system the ore has to travel a much greater distance before being discharged. The coarse ore is given a chance to separate and the concentrates are very clean. The machine works finely in reclaiming sulphurets and will no doubt do well immediately below a battery.

Mr. H. M. Stetson has placed one of his Excelsior amalgamators immediately below the Kennedy mine. All the tailings from the mill flow through the amalgamator, which is a padlocked box with a system of plates and traps. When desired the box can be unlocked and the plates and traps cleaned up. The machine is purely automatic in its operation. Mr. Stetson claims that in 24 hours he caught below 28 stamps of the Omaha mill at Grass Valley \$5 in gold and five ounces of quicksilver.

The South Eureka.

J. Parks is superintendent of this mine. This location is in a very good section. The shaft was put down 40 feet to the vein, the course of which was determined by survey. The vein was struck, but so far the fissure is filled with gangue matter. The owners deserve success for their faith in thus sinking where the vein not only did not drop throughout the length of the location, but was covered all the way by many feet of cemented gravel. The hoist of the Hix mine has been purchased, and is being put in place.

Sutter Creek.

The Hector G. M. Co. owns what was formerly the old Mahoney mine. The Valentine Bros., managers, have started up the 40-stamp mill on ore from the Hubbard, McAdams and Mahoney veins. The old shaft has been reopened, timbered, and a novel and complete water-power hoist erected. Water is brought out to the mine through 5500 feet of steel pipe which delivers the water under a pressure of 450 feet. The hoist takes its power direct from two eight-foot Knight wheels, which are fastened direct to the plinths of the reel or drum, thus doing away with all intermediate shafts, pulleys and belting. The old Mahoney shaft is down 1000 feet with all the ground between the 200 and 600 foot levels to draw on. The Valentines are proceeding in a way that if success is possible will surely bring it. Once the mine's equipment is complete, it is doubtful if any other mine in the county can be worked for less money than the Old Mahoney under S. L. Valentine's management.

The Lincoln.

The creditors are operating the mine and running the mill on surface ore. As they merely aim to get out of the mine what they have got in it, no development work is carried on. It is commonly believed that the Lincoln is a good mine if properly developed and worked.

The Belmont.

The Belmont, J. H. Tibbitts Supt., adjoins the Mahoney, and is east of the Lincoln. The mine is opened by open cut and drift, on the vein, which is 30 feet in width of \$5 ore. Ten stamps are running, with 10 to 20 to be added in the near future. The company will also put down a two-compartment vertical shaft.

Wildman.

The shaft is now down 800 feet on the vein, which runs from 15 to 60 feet in width on \$3 to \$6 ore. The 30-ton mill is handling 60 tons a day of hard quartz, which Mr. J. Tregloan, the superintendent, manages to mine and mill for \$3 a ton. This mine is equipped with every appliance for saving labor.

Knight & Co.

The Sutter Creek Foundry of Knight & Co. is very generally known through the manufacture of the Knight water-wheel, which finds a steady and increasing sale from the little six-inch wheel driving a 12-inch circular saw; the 12-inch furnishes 15 horse power, or sufficient for a ten-stamp mill at the nominal cost of \$60, up to the eight-foot wheels erected on the Hector mine.

Wheels are constantly being shipped, the last order being for four wheels to the carbon coal mines of Washington. The works have just completed a very fine hoist for the south Spring Hill mine, in addition to that of the Hector mine, and have put in a number of their hydraulic pumping engines, besides furnishing a large number of batteries, blowers and other mill machinery, for all of which the works have an enviable reputation.

Amador City.

The South Spring Hill, J. R. Tregloan Supt., is opened to a depth of 900 feet with drifts run 2000 feet on the vein, which carries an average width of eight feet. When crushed in the company's 40-stamp mill, this ore keeps the mine in the rank as a dividend payer. The company has recently erected a Knight water-power rope-transmission hoist, capable of sinking to a depth of 1500 feet. This hoist effects a saving of \$7 a day over the former steam hoist, and is far more satisfactory. The mine is now equipped in every way, and that in the best manner possible, which, coupled with the large vein of high-grade ore and competent management, makes the future of the mine most promising.

The Keystone.

E. T. Hale is superintendent of the Keystone. The ore at this time is coming from old reserves on the 600-foot level, where a large

body of low-grade ore was left standing in the early working of the mine. The superintendent has 20 stamps running on this body of ore and 5 more on ore taken from different parts of the mine to prospect the ore. The Keystone has been worked to a depth of 1400 feet, and, as in all mines, a large amount of ore was left standing which will now be thoroughly tested and, if of sufficient value, worked. In a former article I gave the output of the Keystone, which was over \$7,000,000, with dividends of over \$3,000,000. All of the ground below the 1400 is virgin, and, if explored, may, in depth as at Grass Valley, come in richer than in the upper levels. Mr. Hale is conducting the mine with the greatest economy possible and working in every way to the best possible advantage. If he don't make it pay, it simply can't be done on the present ore bodies.

Bunker Hill.

John Myers is superintendent of this mine. The difficulties that recently closed down the mine have been adjusted and Mr. Myers is now busy repairing the mill, taking the water out of the shafts and getting into shape generally to "resume business at the old stand." The new shaft is being sunk and is now down about 310 feet. This, the north shaft, is operated by a Knight hoist. The motive power is conveyed 800 feet up the mountain side by five wire cables running over sheaves, delivering the power 250 feet (vertically) above the eight foot water-wheel. The entire cost of the power is but \$1.20 a day. Mr. Myers states that the action of the hoist is as quick and positive as though connected direct to an engine. This method of placing the water-wheel at the base of the mountain and erecting the hoist or mill wherever it can be best started for the most rapid and economical working, serves a double purpose in this: that the greatest power possible on the site is obtained and there is the least expense possible in moving the ore.

Gover M. & M. Co.

J. and A. B. Cole are in charge of this mine. The writer was taken all through the mine, and seldom has it been his lot to see as large reserves of ore as here contained. To all appearance, there is now sufficient ore in sight (were the entire body milled) to keep a 40-stamp mill running for ten years. The company, however, is not content with the present reserves, but is driving ahead with its drifts and will send the shaft on down to a depth of 1200 feet. The greater part of the present ore was blocked out in the earlier history of the mine—some 15 years ago. After that, the mine lay idle for a number of years, and the greater portion of the mine's workings filled up. These have now been cleaned out and retimbered, except in the extreme lower levels. On the first, or 300-foot level, the vein is 20 feet wide, and has a drift run 278 feet. On the second, or 400-foot level, the drift south has been run 300 feet and shows 15 feet of ore. The 500-foot level has a drift 300 feet south, with 20 feet of vein matter; and north 262 feet, with the vein running from 20 to 50 feet. On the 600 foot, the drift is now in 600 feet south, with 30 feet of vein and north 75 feet on a 40-foot vein. The 700-foot level is in south 300 feet with vein running from 20 to 30 feet, and north 400 feet on a 15 to 20 foot vein. In the lower levels a crosscut has been driven 50 feet and a parallel vein crosscut, which is a mine—and a big one—in itself. The mine is operated through a fine three-compartment shaft. The power at the shaft is steam. From the mine, a tramway 1000 feet long runs to the mill, over which the ore travel by gravity and discharge automatically at the mill. The mill is of 20 stamps, with Woodbury concentrators. The most interesting feature connected with the mine's machinery is the electric pumping plant of the Edison Co. with Dow pumps. This system was fully described in the MINING AND SCIENTIFIC PRESS, of July 4th. The plant is a success in every way throwing a steady flow of 12 inches of water from the 400 and 700-foot levels, where the water is held in reservoirs until sufficient is stored to employ the plant which readily pumps the mine's water all out, in five out of the 24 hours, and will no doubt be able to cope with all the water that may be reached in depth. All of the work connected with sinking, clearing out the old workings—retimbering driving the drifts ahead, rebuilding and equipping the mill, the electric plant and the thousand and one other expenses on a mine, have been paid for out of the proceeds of the ore, and a steady reserve created for future contemplated equipment.

Plymouth.

The mines of the Louvre Cons., G. M. Co., J. W. Brown superintendent, are located four miles north of Plymouth on the south bank of the Cosumnes river and on the Mother lode. The mines are opened from the mountain side, by a tunnel 320 feet long with 100 feet to go to the ore shoot 425 feet deep. The vein as far as opened, averages seven feet in width of \$5 ore. The tunnel, tapping the vein at a depth of 425 feet, will doubtless show a large vein and of a higher grade than that in the surface workings. The company has three mines—the Frankfort, Bismark and Louvre, all of which will be worked from this tunnel and a main working shaft.

The Plymouth.

W. T. Jones the superintendent is driving a drift south in new ground on the 1000-foot level, and is just getting into a body of fine

ore, that shows in the 1245 level where it is from one to six feet in width. The mill is not running at this time.

Bay State.

W. T. Jones is superintendent of this mine. The three-compartment shaft is fairly started and is now down about 50 feet. The shaft is going down in the country rock about 40 feet distant from, but with the same pitch as the vein. By keeping this distance from the vein, Mr. Jones expects to have a much smaller amount of water to haul than he would were the shaft put down on the vein. The shaft will be put down 300 feet and then a crosscut run to the vein and a level run. It is expected that the vein will be crosscut some time in January, 1892.

There has been no needless expense encountered, but the greatest economy practiced, and the people of Plumas who are backing the enterprise can see and know that their money is all being made to go to the greatest length. May the Bay State prove the equal of the old and famous mines of the section.

When the size of the veins, the average value of the ore and the number of stamps dropping are taken into consideration, it is not at all difficult to see that Amador mines stand to-day in the front rank, with every evidence that a year hence she will show a larger field and a still greater degree of prosperity.

E. H. SCHAEFFLE.

Country Roads and City Streets.

NUMBER I.

[An essay by MRS. MARY L. HOFFMAN, read at the meeting of the Women's Press Association in S. F., July 13, 1891, and furnished for publication in the PRESS.]

Prof. Shaler, of Harvard College, in an able allusion upon the subject, has referred to the fact that in Egypt, 4000 years ago, sleds were used for purposes of transportation, that these sleds when heavily loaded were rolled along the earth by means of round sticks upon which the sleds were placed, so that by changing the sticks a movement was accomplished similar to that of our horse-moving upon rollers. Later, wheels were firmly placed upon these sticks, so that each stick as an axis turned over with its wheels; then the axle came to be made fast, leaving the wheels free. And so the wheeled vehicle was evolved. With wheeled vehicles, roads became a necessity.

About 2000 years before Christ Semirais—an able woman—the Queen of Assyria is said to have built a road from Susa to Sardis, a distance of 2000 miles. A thousand years later, the inventive and practical Carthaginians were at road-building, and into battle were taking chariots. The Romans, keenly alive to every advantage, were soon excelling all their predecessors and all their contemporaries, and with substantial roads, as with bands of steel, were they hindering together the nations they had conquered.

The Greeks built roads, notably a sacred road to the Delphic Oracle.

But pre-eminently were the Romans builders of roads. If confronted by failure, from her they wrested the torch of success, and pressed forward.

The reigns of Augustus, of Vespasian and of Trajan, with the incoming of the Christian Era, were especially marked in the Roman Empire by the building of fine carriage ways.

One of the earliest Roman roads—built at least 300 years before Christ—from Rome to Capua, is to-day, after a lapse of 2200 years in excellent condition.

[In brackets I would like to say right here, that if some of the macadamized roads, so-called, to be found, not a hundred miles from this platform, be in existence two years from now, 'more's the pity.'] The Apian Way has done credit to its builders for 2200 years. When the glory of Rome departed, and her thrifty energy failed, wheeled vehicles fell into disuse, and pack animals were resorted to.

Coming down to modern times, we find roads built, first in Holland, then in Spain, and afterward in England.

The *Iconographie*, a valuable German authority, gives the date of the first road in Germany as 1753, and the average width of German roads as 50 feet, while the average width of the English road is 25 feet.

The bad roads of England in the 17th century were called "wicked ways," and when we contemplate the character of some of the officials in whose charge they were, we suspect the term to have had a double application.

About 400 years ago the wheeled vehicle appeared in modern Europe, but we were well along in the 17th century before England was at road-building.

The United States of America, representing more than one-fifth of the civilized people of the earth, is the wealthiest nation in the world to-day, and the freest. Here, surely, for bad roads there is no excuse, and as more than one-half the people of America now inhabit cities, we will give attention to city streets.

Good Roads and Prosperity.

California, our lovely State of the orange and the poppy, the fig tree and the vine, with climate and scenery unsurpassed, is in size the second State of our Union, and is in per capita wealth the greatest. Her queen city, already third in the value of her imports and sixth in value of her exports, and rapidly becoming a great commercial ruler, should not allow her streets to be excelled by those of a younger city located on a lake, while she, San Francisco,

stands upon the largest ocean of the world, with the best harbor in the world.

"The Lake City" has a system of boulevards connecting the different Parks and making a drive of many miles in extent, from park to park, these driveways being bordered by flowers and shrubs and trees and charming strips of lawn for the eye to rest upon.

Michigan Boulevard was an avenue before it was a boulevard. Upon every place of property upon that avenue was levied a tax of \$20 a front foot as a boulevard tax—this in addition to all other taxes. The \$500 tax paid by every owner of a 25-foot lot was used as a sinking fund with which to build the boulevard and forever keep it in repair; then, throughout the entire length of this avenue, trees at the curb were uprooted, sidewalks destroyed, and the same quality and style of walk and curb and pavement built and shade trees planted; then men were placed in charge, and during the summer-time not a dead leaf falls but it is immediately picked up and carried away. In winter, snow and sleet and mud disappear as if by magic, and here, as on Drexel and other boulevards, it is a pleasure to live.

Property values along the boulevard and in its vicinity have increased immensely, and the \$500 tax is already regarded with a smile of approval. In a similar manner have been built other boulevards of the same city, and we see Chicago with no heights, no ocean and no harbor, but with men and women back of her great enterprises who possess the foresight, the vim, the lavish hand that of great enterprises makes great successes. Result—a population of a million souls.

Let us copy her boulevard and the wide-awake enterprise of her men and women.

For the building and equipping of a railroad across the "Great American Desert" over mountains and through uninhabited districts, the brain and nerve have been found in California.

The inventor of the cable road, the builders of its most successful systems and great electric railroad builders have been found here.

Our Golden Gate Park has many attractive features that are unequalled by any other park of the world, and this is largely due to the excellent management of Gen. Hammond and others in power.

Our philanthropic and charitable and religious societies, with their men brave and their women virtuous and courageous, are doing good work. For all these, competent leaders have appeared; for another and possibly a greater leader, we look.

We realize with pride that the railway mileage of this country is as great as that of all the world besides; and now, should we not make permanent and attractive the ways that border our homes and that lead forth to the fragrant fields of the country?

We have men among us, wise, keen and progressive enough to build and operate railroads, to erect magnificent structures and to look after their sanitary conditions. Where, now, is the engineer, the financier, the diplomatist, able to give to even one city of this commonwealth the streets that are her due?

Government Road Supervision.

England, France and Germany have all their roads under national supervision, and each of these wily nations builds a thoroughly good road, while she watches her rivals.

If our National Government should appoint a highly qualified roadmaster, to whom the roadmaster of every State—himself a competent engineer—should be responsible, and to whom the county roadmaster should be subject, the work of each year would not only be valuable in itself, but would form a part of one symmetric whole.

Into the Legislature of Massachusetts, of New York, and of other States, bills have been introduced looking to State supervision of roads. By giving to the consideration of road and street improvement a goodly share of space, the Governors of Massachusetts and of Pennsylvania have popularized their messages.

In New England, roads for 250 years have been built at the public expense; while in Kentucky, in Virginia and in some other States, the toll-road system has prevailed. "Oppressed" Ireland abolished her toll-gates in 1853; but Pennsylvania still permits them. In some parts of the United States pack animals are still used for the transportation of merchandise—notably in the Appalachian and Cumberland mountains.

In a paper upon "Permanent Improvement in Highways" read, recently, by Mr. George E. Crane, before the Minneapolis Society of Civil Engineers, the author states that \$800,000 is practically thrown away every year by the present system of road-making in the State of Minnesota.

Prof. Shaler says: In no phase of public duties does the American citizen appear to such disadvantage as in the construction of roads. Mr. Shaler, after giving the subject the most careful attention, reckons that, even in New England, the waste of money expended upon roads, reckoning loss of time and transporting power of vehicles, wear and tear of wagons and carriages, and of beasts that draw them, averages \$10 a year for each household, a greater expenditure than that incurred for schools or for any other single element of public interest, coming near the sum of all our State and Federal taxes put together.

We hope by the assistance of an army of enlightened men and women, who are to-day making this subject a study, to hasten, through

the press and in other ways, an awakening of the great mass of taxpayers to the lax manner in which many of our roads are claimed to be built, but are not even apparently built.

(To be Continued)

The Precipitation of Metals from Hyposulphite Solutions.

CONCLUDED.

[Read by C. A. STRICKLAND, of San Francisco, before the American Institute of Mining Engineers.]

TABLE A.—Precipitating-Coefficients for c. p. Reagents.

Calculations are based upon the following approximate chemical equivalents, frequently used:

H=1; O 16; C=12; S 32; N 23; Ca=40; Ag 108; Pb 207; Cu 63.

Precipitating-Coefficients for NaHO, Consumed in the Manufacture of Na₂S₂O₃.

100 NaHO precipitates 180.0 Ag as Ag₂S.
100 NaHO precipitates 172.5 Pb as PbS.
100 NaHO precipitates 105.0 Cu as Cu₂S.
Adding 103.3 Na₂S₂O₃+5 aq.
The following quantities of NaHO and S, consumed in the manufacture of Na₂S and Na₂S₂O₃, are needed for the precipitation of metals:

For 100.	NaHO	Sulphur for Na ₂ S, Na ₂ S ₂ O ₃	Adding Na ₂ S ₂ O ₃ +5 aq.
Ag.....	55.5	29.6	44.4
Pb.....	58.0	30.9	40.4
Cu.....	55.2	50.7	76.1

Precipitation of Lead and Calcium by Na₂CO₃.

100 Na₂CO₃ precipitates 195.3 Pb as PbCO₃.
100 Na₂CO₃ precipitates 37.7 Ca as CaCO₃.
For precipitation of 100 Pb are needed 51.2 Na₂CO₃.
100 Ca are needed 265.0 Na₂CO₃.

TABLE B.—Precipitating-Coefficients for Commercial Reagents.

Caustic soda with 90 per cent. NaHO, corresponding to the English rating of 70.6 per cent.; sulphur with 95 per cent. S; Solvay soda with 98 per cent. Na₂CO₃.

Precipitating-Coefficients for Caustic Soda Consumed in the Manufacture of Na₂S₂O₃.

100 Caustic soda precipitates 162.0 Ag as Ag₂S.
100 Caustic soda precipitates 155.2 Pb as PbS.

100 Caustic soda precipitates 94.5 Cu as Cu₂S.
Adding 93 Na₂S₂O₃+5 aq.

The following quantities of caustic soda and sulphur, consumed in the manufacture of Russell's sulphide and Na₂S₂, are needed in the precipitation of metals:

For 100.	NaHO	Russell's Sulphide	Na ₂ S ₂	Adding Na ₂ S ₂ O ₃ +5 aq.
Ag.....	61.6	41.0	46.7	57.3
Pb.....	64.4	42.9	48.8	59.9
Cu.....	105.7	70.4	80.0	98.3

Precipitation of Lead and Calcium by Solvay Soda.

100 Solvay soda precipitates 191.4 Pb as PbCO₃.
100 Solvay soda precipitates 36.9 Ca as CaCO₃.
For precipitation of 100 Pb are needed 52.2 Solvay soda.
100 Ca are needed 270.3 Solvay soda.

TABLE C.—Weights of Precipitates and their Percentages in Metals.

From 100.	If precipitated by Russell's Sulphide.	Na ₂ S ₂	CaS ₂
Ag.....	124.3	129.8	174.1
Pb.....	125.3	130.9	177.3
Cu.....	141.6	150.8	227.3

Weights of Carbonates.

The precipitation by Solvay soda will produce from:

100 Pb.....129.0 P CO₃
100 Ca.....250.0 C CO₃

Percentages of Metals in Sulphides

Percentage of	Russell's Sulphide.	Na ₂ S ₂	CaS ₂
Ag in Silver Sulphide.....	80.4	77.1	57.4
Pb in Lead Sulphide.....	79.7	78.4	58.4
Cu in Copper Sulphide.....	70.6	66.3	44.0

Percentages of Metals in Carbonates.

Lead carbonate, 77.5 Pb.
Calcium carbonate, 40.0 Ca.

TABLE D.—Financial Results.

Showing the cost of precipitation by Russell's sulphide, Na₂S₂, and by Solvay soda, assuming the following prices for commercial chemicals put down at the mill: caustic soda, 5.5 cents; sulphur, 3.5 cents; Solvay soda, 4.0 cents; hyposulphite, 4.0 cents per pound.

Cost of Precipitating Metals as Sulphides.

For 100 Pounds	By Russell's Sulphide.	By Na ₂ S ₂	Gain in Na ₂ S ₂ O ₃ +5 aq.	N't cost using Russell's Sulphide	Difference in cost between R.S. and Na ₂ S ₂
Ag.....	\$4.82	\$5.02	\$2.20	\$2.63	\$2.73
Pb.....	5.04	5.25	2.40	2.64	2.85
Cu.....	8.28	8.61	3.93	4.35	4.68

Cost of Precipitating Lead and Calcium as Carbonates.

For 100 pounds Pb., \$2.09
For 100 pounds Ca., 10.81

TABLE E.—Showing the quantities of caustic lime and sulphur consumed in the manufacture of CaS₂, needed for the precipitation of metals.

For 100 pounds.	Caustic Lime.	Sulphur.	Adding Na ₂ S ₂ O ₃ +5 aq.
Ag.....	302.4	130.2	68.8
Pb.....	316.1	130.1	71.9
Cu.....	519.0	223.4	113.0

This table is based on comparative statistics obtained in the Consuehirachi mill, Mexico.

TABLE F.—Showing the cost of precipitation by CaS₂, assuming price of caustic lime at 3 cents per pound, and that of other chemicals, the same as given in table D.

Cost of Precipitating 100 Pounds.	Caustic Lime.	Sulphur.	Total.	Gain in Na ₂ S ₂ O ₃ +5 aq.	Net Cost.
Ag.....	\$2.58	\$4.56	\$6.82	\$2.75	\$4.07
Pb.....	2.37	4.78	7.13	2.83	4.25
Cu.....	3.89	7.82	11.71	4.72	9.99

This table is based upon the figures given in table E.

§ 7. Application of the Tables to Special Cases.

In this section the tables will be applied to examine the cost of precipitation in special cases. It is assumed that the ore contains lead and a small amount of calcium. Although its contents in copper are insignificant, the copper from extra-solution, necessary for treatment, comes to precipitation. We will neglect the comparatively small amount of silver precipitated with the lead-calcium carbonates, assuming that each silver is paid for at the same rates as silver in sulphides. Prices of chemicals are taken as stated in Table D.

We further assume the following terms, according to a case as it really exists, for the disposal of the sulphides to smelting-works and the cost of handling the precipitates:

The Mareac mill, according to W. A. Wilson, sells its sulphides to the Omaha & Grant S. & R. Co., the latter paying for 97 per cent. of the silver, New York quotations, charging \$30 per ton for treatment, but paying freight from Park City to Omaha. No allowance is made for copper or lead. [Gold is paid for at the rate of \$20 per ounce.]

Carbonate precipitates are taken at the same rates, as also the low-grade precipitates from the first wash-water. It will be seen at once that the disposal of carbonates at sulphide rates cannot be favorable to the separate precipitation of lead in the presence of calcium. The Mareac mill used this method formerly for a short time only, then abandoned it, but has adopted it again recently. A better market for carbonates will, no doubt, be found hereafter.

The cost of handling precipitates is assumed at \$10 per ton.

EXAMPLE.

The solution obtained in lixiviation contains per ton of ore:

- 3 pounds (43½ ounces) silver.
- 1 pound copper.
- 3 pounds lead.
- 2 pound calcium.

Four pounds sodium hyposulphite have to be regenerated from tetrathionate in precipitation. This expense, however, we need not consider, since it is the same for Methods 1 and 3.

I hardly need remind the reader that in precipitation Na₂S₂ free from Na₂CO₃ is used, and not an oxidized solution of Russell's sulphide, which would also precipitate calcium in Method 1, changing the weight and grade of the sulphides.

Weights of Precipitates.	Precipitation by Method 1	Method 3.
Sulphides.....	9.32 pounds.	6.40 pounds.
Carbonates.....		5.12 pounds.

Sulphides contain		
Ag, per ton, oz.....	9,338.5	16,201.7
Cu, per cent.....	10.73	13.62
Pb, per cent.....	32.19	

Carbonates contain Pb, per cent, 58.6.

Cost of	Cents.	Cents.
Precipitation.....	21.42	25.45
Handling.....	4.66	5.26
Reduction, sulphides.....	13.95	15.78
Total.....	40.03	46.49

It will be seen at once that separate precipitation of lead and calcium cannot be profitable if carbonates are sold at sulphide rates. Also, that Method 3 becomes more costly, the more calcium is present in proportion to the lead.

We will now assume 90 per cent. of the lead in carbonates to be paid for at the rate of 2 cents per pound, and freight and smelting-charges to be \$15 per ton; also that silver is paid for at sulphide rates. This would give the following result:

Precipitation.....	Cents.
Handling.....	25.45
Reduction, sulphides.....	5.20
Reduction, carbonates.....	8.70
Total.....	42.05
Less amount realized from sale of lead, ...	5.40
Total.....	37.25

Should the buyer, however, deduct 5 per cent. of the silver in place of 3 per cent., nearly all the profit from the sale of lead may be consumed, or even a negative balance left, depending on the richness of the carbonates in silver.

It is hardly necessary to continue this discussion. The separate precipitation of lead and calcium by Solvay soda is evidently not so profitable as its advocates claim. If lead alone is present, or the amount of calcium is very slight in proportion to lead, Method 3 can be used to advantage.

It is claimed that the removal of calcium from lixiviation-solution has a beneficial effect on the extraction of the silver. Whether this is true, I do not know.

If sulphides are refined at the mill by a humid process with sulphuric acid, the absence of lead and calcium is essential to success; and in this case Method 3 is of great value, as I shall demonstrate in another paper.

My friends who operate lixiviation-works will, most likely, object to many conclusions I have drawn in this treatise, saying that the process as carried out in practice is not like that operated here on paper. If they will bring out an array of facts, proving that I am wrong, I shall consider myself the gainer, earning the thanks of the profession for bringing information to light which otherwise would have remained hidden.

APPENDIX.

The Loss of Hyposulphite in Lixiviation.

In connection with precipitation, some remarks about the loss of hyposulphite in lixiviation will be pertinent.

As has been shown, large amounts of hyposulphite are added to the stock-solution in precipitation, even with freshly prepared caustic or sodium sulphides. From this it might be expected that the stock-solution would always increase in strength and concentration. This is only the case if, in ordinary lixiviation, CaS₂ is used as precipitant, and comparatively large amounts of copper and lead are thrown down together with the silver.

The losses in hyposulphite are partly mechanical, and partly caused by chemical decomposition. The mechanical losses take place when first wash-water is replaced by stock-solution, and again when the latter is replaced by the second wash-water. In these operations, no matter how carefully they are conducted, water and stock-solution are more or less mixed, especially where the filters are not in good condition and are partly choked. Thus, in replacing the first wash-water, a certain quantity of hyposulphite solution results, too weak to be mixed with the normal solution; for this reason it is transferred to a separate precipitating-tank, precipitated there by itself, and the decanted clear solution run to waste. As soon as the solution shows a certain strength in hyposulphite, which is ascertained by the iodine-test, it is turned into a regular precipitating-tank. The same is the case in replacing the solution by the second wash-water. The higher the percentage of hyposulphite in the stock-solution, the greater this mechanical loss.

The chemical losses are caused as follows:

1. By oxidation in contact with the atmosphere, hyposulphite being converted into sulphate. This loss depends on the quantity of solution used per ton of ore and kept in rotation, its temperature, and upon atmospheric conditions, most likely the contents of the atmosphere in ozone.
2. By converting hyposulphite into tetrathionate in preparing extra-solution, and further formation of tetrathionate by atmospheric oxidation of extra-solution. This loss is, however, made largely good again by close precipitation, and may be almost completely covered by over-precipitation.
3. By decomposition of extra-solution with formation of Cu₂S and sulphates; this loss being final and irremediable. It is greatest where extra-solution has to perform much work—i.e., where standard extra-solution must be used warm and is circulated. It is, no doubt, greater if a Koerting ejector is used for circulation than with a geyser-pump. This subject is discussed in my paper, "The Details of Construction for a Modern Lixiviation Plant."

Mining Bureau Museum.

The following are among the recent additions to the collection of the California State Mining Bureau:

- Chalcosite—Abiquiu, N. M.
- Apatite, with fluor spar, and calcite—Peterborough, Canada, from F. C. Brodie.
- Gold quartz, rich in free gold in "wire" and "leaf" form—Green Mountain mine, Siskiyou Co., Cal.; Allen Bros.
- Gold quartz (free gold)—Cincinnati Belle mine, San Diego Co., Cal.
- Kaolin of fine quality—Heraldberg, Sonoma Co., Cal.; F. H. Sheldorf.
- Cookeite—Oro Grande, San Bernardino Co., Cal.; H. C. Adams.
- Gold quartz and silver ores—Fifteen rich specimens, several showing abundant free gold and native silver, from leading mines of Sierra Co., New Mexico; C. H. Laidlaw.
- Tremolite—Halsed mine, Plumas Co., Cal.
- Calcite—Two crystallized specimens, Lancashire, England; Williamsburg Scientific Society.
- Chalcopyrite—From a large deposit in Josephine Co., Oregon; W. Worthington.

BENT WHALEBONES can be restored and used again by simply soaking in water a few hours and then drying them.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KENNEDY.—*Ledger*, Aug. 15: The cleanup at the Kennedy this month is said to equal, if not exceed, the big yield of the previous month. This mine is producing more bullion than any quartz mine ever before yielded in this county, for the same amount of ore crushed. With a 40-stamp mill it is surrendering as much gold as the Plymouth Consolidated did in its palmiest days with twice that number of stamps. The magnificent record it is making ought to encourage the development of other claims now idle in that vicinity. A strong impression exists in the minds of many that the Oneida, the adjoining claim on the north, which was abandoned over 10 years ago, ought to be reopened.

MINE ATTACHED.—George Newman commenced suit last Wednesday against the Clinton Con. M. Co., operating the Gardner property near Clinton, for the recovery of \$517.90, alleged to be due for supplies and money loaned. Attachment papers were placed in the hands of the sheriff, who went up and served them the same afternoon. The officers of the company have not been at the works for two or three weeks. The news of the attachment was at once telegraphed to the office in San Francisco, and word was returned that some of the company would be up this (Friday) evening and settle everything. The mine and mill are running as usual, the sheriff leaving a keeper in charge. Different opinions are entertained as to what this action will lead to. The company has paid several dividends of 15 cents per share. They are making extensive surface improvements, sinking a shaft, putting up hoisting works, chlorination works and dwelling houses, and from all these indications one would suppose they had a good paying property and were intent upon the legitimate development of the same. On the other hand, it has been hinted that there has been considerable dealing in the stock. How this suit will affect the future operations remains to be seen. The employees are about 50 in number. They have been paid up closely, there being only one month's salary owing, which became due this week. It is generally believed that matters will be straightened out in a few days.

THE BUNKER HILL MINE paid the wages of employees for the month of July, as per agreement. The back indebtedness has not been reduced, and probably will not be until the complications of the company in the East are straightened out. At the old Keystone a new winze is being sunk to explore the mine to a considerably greater depth. The prospects of this veteran gold-producer are reported to be brightening.

SUTTER CREEK.—*Cor. Amador Ledger*, Aug. 15: The Lincoln has been brought to a temporary standstill, on account of a slight break in the ditch. It will soon be in operation again, however. The Hector and the Belmont paid off this week. The hoisting works at the South Eureka are about completed. It is expected that sinking will be resumed the latter part of this week. The transmitting power, which is 550 feet from the shaft, works like a charm. The cut-off apparatus, which is a contrivance of Andy Riley, is an excellent thing. It is operated by a hand-lever, and the machinery can be reversed in an instant. Everything about the premises is as complete as can be seen in the county. The work of putting up a new hoist and other improvements at the Hector is progressing rapidly, and in another three weeks everything will be completed. The water will then be taken out and drifting will be pushed ahead.

Calaveras.

INDIAN CREEK.—*Cor. Calaveras Prospect*, Aug. 15: Cunliffe and Driver are engaged upon their mine on Indian creek at present. They are engaged in running a level at a depth in the shaft of 200 feet and are running toward a chute that was formerly exceedingly rich. J. Sublett has been having a quantity of ore from his mine crushed at the Total Wreck mill previous to the removal of said mill to Indian creek. The crushing from all accounts will net the gentleman a good round sum and be a flattering yield. Some of the ore was rich in specimens.

El Dorado District.

GOLD DISCOVERIES.—*Mt. Democrat*, Aug. 15: Some important discoveries of gold are being made 15 miles east of this city in the headwaters of Long canyon. A few months ago Dan Coughlin, Supt. of the Rogers mine at Smith's Flat, Wm. Weiman and Mr. Nedecker, made a location on Rich gulch, a tributary of that stream, where they have been working for about five weeks. In an interview with Mr. Weiman, we learn that the gold is of a coarse nature, being very smooth, clearly indicating that the stream has been fed from a gravel channel existing under the lava-capped ridge which runs south of and parallel with the South Fork of the American river for a distance of 30 miles easterly from Smith's Flat. The fact of the existence of a rich channel in this ridge has been demonstrated by boring at the Blair mine about the Nine Mile House.

BLUE STAR.—At the Blue Star mine, in Nashville district, a shaft has been sunk 70 feet on a four-foot ledge of good ore. A tunnel is now being run to cut the ledge at considerable depth at the contact between slate and granite. This promises to make a good mine. The Los Padre mine, in the same district, is turning out excellent ore, and bids fair to become one of the leading mines of the district. Nic Miller is opening a mine in the same belt east of Nashville, from which ore is now being taken showing free gold. Several men are at work at the Oaks mine, near Henry's Diggings, from which we get favorable reports. The Parker mine is running regularly and is making its regular output of bullion. The Dalmatia output is improving. Capt. Newton was in from the Darling mine and reports everything as progressing satisfactorily.

CHILI BAR.—Thirty-four dollars to the pan was obtained in a claim on the American river below Chili Bar during the week. Good ore is being obtained in the upraise at the end of the tunnel, which is in 2000 feet. The south drift in the Gentle Annie mine is turning out ore of better quality than any heretofore found in this mine. Their last cleanup showed a decided gain.

Napa.

A DEPOSIT OF ALUM.—*St. Helena Star*, Aug. 15: Orin Caverly, who owns a small place in what is known as the Oakland colony, in Conn valley, about four miles from St. Helena, has discovered a deposit of alum rock on his place. Mr. Caverly came to town Wednesday and left a sample of the rock. It has the appearance of alum and has the exact taste. The gentleman says the rock lies in large quantities in the hills on his place, and thinks it may prove a valuable find. Thus one more mineral is added to the long list which makes our county famous.

Nevada.

GOLD EXTRACTING COMPANY.—*Grass Valley Telegraph*, Aug. 15: The Grass Valley Gold Extracting Co., J. W. Higgingbottom general manager, is making extensive improvements upon its works on the line of the narrow gauge railroad. A crushing plant is to be erected which will consist of Krom's steel rollers and rock-breakers. The plans for the same have arrived, and the masons are now engaged in putting in a foundation. This plant will change the base of operations of the company, who will hereafter crush and chlorinate fractious ores instead of chlorinating concentrates or sulphurets from free milling quartz. Several tons of quartz are already in the bins, to be crushed as soon as the rolls are in position. Mr. Higgingbottom has ordered quite a large quantity of the celebrated Meadow Lake ore to make a test, as he believes that the gold can be extracted by the Pollock process. Mr. Higgingbottom is engaged in driving a tunnel into the hill south of the works, from which flattering prospects come.

THE KEYSTONE LEDGE.—*Grass Valley Union*, Aug. 14: Adolph Dulmaine, who is a large shareholder in the Keystone ground, has been at work lately getting out a crushing from a prospect shaft on the ground. There were nine loads of rock taken from a 15-inch ledge and hauled to the Crown Point mine, where it is now being crushed. The ore looks well, and a generous yield is expected. The Keystone is on Ophir Hill near the Empire.

SLATE LEDGE.—*Telegraph*, August 13: Work is going briskly on at the Slate Ledge mine, on Wolf Creek, and the 10 stamps are kept running steadily. The tunnel is now in 1400 feet and stopping has been commenced. The ledge averages 18 inches in thickness and 10 men are employed in and about the mine. There are 50,000 shares in the mine, all of which are owned in this vicinity. Mr. Alfred Perrin, who is the principal owner, says that the returns are most gratifying. The tunnel is still being pushed ahead.

KEYSTONE PROSPECT.—Adolph Dulmaine and Alcead Sauvee are taking out some ore from a prospect shaft on their claim known as the Keystone. The location is on Ophir Hill in close proximity to the Empire. Nine loads of the ore has been hauled to the Crown Point mill and is being crushed. It looks well and good results are anticipated.

WORK BEGUN.—*Grass Valley Telegraph*, Aug. 14: This (Friday) morning Wm. May, the well-known millwright, with a corps of assistants, began work at the California mine, in the way of putting up buildings for the hoisting and pumping works and in placing the machinery. The material, machinery and all, is now on the ground, with the exception of a few pieces which can be furnished at a moment's notice. Mr. May thinks that it will take about 30 days to complete the job. The engines, boilers, hoisting gear and in fact everything about the premises is in first class condition, and as soon as the hoisting works have been completed, Mr. May will put in a battery for stamps. The machinery will, for the present, be run by steam.

AN OLD TUNNEL.—*Truckee Republican*, Aug. 15: A few days ago, while working in the timber near his mill, which is situated about five miles south of town, George Schaffer discovered an abandoned tunnel on a quartz ledge. It is in the side of Snobomish mountain. Some of the rock was taken out and assayed \$47.40 per ton. The tunnel is probably 30 years or more old. In early days, there was a great mining excitement in the region of country extending through the section mentioned, Elizabethtown, and Knoxville, all lying between Truckee and Tahoe. There are many old tunnels in this region that have been known for many years, but this present discovery is a new one in a district not before known to have been prospected. This work was done in the days of placer mining before it was known how to handle quartz. Mr. Schaffer informs us that the quartz taken from the dump at the mouth of the tunnel was sent to Sacramento, and assayed \$40 per ton in free gold, and \$1.75 in silver. The tunnel has been timbered and a track was laid. The timbers are now mostly decayed, so long ago was the work done. The tunnel is about half full of water. Mr. Schaffer has employed men to go to work Monday morning baling out the water. He will thoroughly prospect the place.

Mono.

STANDARD.—*Bodie Miner*, Aug. 14: An extra force of men have been at work at the Standard the past week putting in a new pump and overhauling the pump engine. The old hob has been in use altogether 28 years, having done service for 17 years on the Comstock before being brought to Bodie, and has been in use here for 11 years. The hob is 30 feet long by 26 inches wide and 27 inches thick, and is of pine, having been cut from a mammoth tree at Mono Mills. The putting in of a new hob is a difficult task, and it will probably be two weeks before the job is completed. The pump engine is being put in order so as to get water for mill purposes. Last month the Standard shipped bullion to the amount of \$23,327.24. Much work is being done and the mine is looking well.

Sierra.

MARGUERITE.—*Mt. Messenger*, Aug. 15: Daniel Ware informs us that a force of men has been put out to repair the Marguerite ditch, and that work on the mine will be commenced as soon as water can be got through the ditch.

THE EXTENSION MINE yielded 79 ounces of gold for last week's run. The company has begun the erection of a large boarding house, which was an absolute necessity before any more men could be employed. The outlook for the mine was never so promising as now, although the erection of the necessary buildings and the preparations for winter, will prevent the declaration of dividends for some time. Now that the prospect dump is available, it has been ascertained that the gravel is yielding \$2.25, the expense of working being about 80 cents a cubic

yard. The channel is about 300 feet wide, as far as prospected.

GOLDEN GIANT.—The workmen in the Golden Giant have just raised a shaft 80 feet and find pipe-clay on the bedrock. The only better indication would be to find gravel, but not as high as that. When the tunnel is put ahead the channel will be found and it will, beyond doubt, be good. There will be indications when they are near the channel, and raising a shaft every few feet is a waste of money. The Wide Awake mine is prospecting finely, the gravel paying about \$2.50 to the carload, it is said. Work of prospecting the Rocky Peak drift claim is to be begun again soon at a different point from where it was attempted before.

HOWLAND FLAT.—*Cor. Mt. Messenger*, Aug. 15: Running through this section of country are to be seen numerous quartz stringers, of varying widths, which are generally considered barren and worthless. This is not altogether the case, however, as some of them contain free gold, possibly in paying quantities if systematically looked after. Cox and Downer have a very promising claim of this character, near here. In a very quiet way several thousand dollars have been taken out. I was shown by Mr. Cox, about a ton of this specimen rock, some of which was exceedingly rich. The owners are pushing the work of development as rapidly as possible, and I was informed that three good chimneys had been discovered within a distance of 600 feet. Some quartz prospector from the lower county has C. W. Hendel surveying and locating a quartz ledge at Chanderville. The recent developments made by Cox & Co., has created quite a quartz excitement in this section, and the result will be the finding of some valuable ledges, which will be of more than passing interest to those making the discovery, and of substantial benefit to the county and State generally. The Midas drift mine has been an assessment mine up to this time. Much work has been done, and tunnels and gangways driven, but without finding gravel rich enough to pay a profit. Very recent developments seem to warrant the conclusion that the main tunnel has not yet reached the pay channel, and the stockholders are now more hopeful.

PORT WINE shows more signs of life than most of the mining towns in this section, and reminds one in no small degree of earlier times when the Slope and the Queen, etc., furnished scores of hardy miners with an opportunity to labor. The Riffle drift claim, near and above Grass Flat, cleaned up recently, with results that were satisfactory to the owners. Twenty men are employed here. The main tunnel is about 900 feet long, two-thirds of which was through hard rock, 1000 feet of it costing \$22 a foot. The gravel is blue and the wash heavy. The gold sells at La Porte for \$18.50 per ounce. The channel is believed to come down from the neighborhood of Table Rock.

Placer.

THE MOORE.—*Herald*, Aug. 15: T. M. Thorpe, one of the owners of the now famous Moore quartz mine, located about a mile and a half west of Auburn, was in town a few days ago, and he tells us that since they got through with the dead work in straightening out their shaft, they have been taking out as rich rock as ever came from the mine. Since their last crushing, they have taken out some \$6000 or \$7000 in specimens, and the ore on the dump, after being thus culled, it is estimated will go at least \$100 to the ton. This ledge has been rich at all points and at all depths as far as prospected, and the beauty of it is, the deeper they go the richer it gets.

Siakiyou

SCOTT BAR.—*Cor. Telegram*, Aug. 15: The mines as usual are in full blast. Many of them yield fair returns to the owners. The Gold Hill Co. intends to renew operations in their mine on Gold Hill next week. This mine, when developed, will no doubt rank as one of the foremost mines in the county.

San Diego.

GOLD KING.—*Julian Sentinel*, Aug. 13: Rumors of a rich strike at the Gold King was confirmed by a personal visit to the property. The rich ore comes from the 100-foot level, and specimens shown us are unsurpassed by anything in the camp. A thousand dollars is an estimate of the run of a ton of such rock. Not only is the ore very rich, but the adjoining walls of earth and sandstone are full of gold. The vein so far opened is 18 inches in width, and 40 feet of this is in sight. The extent of this new find is unknown, but is now being prospected. At the 180-foot level of the King, a new vein has been cut into that shows some promise. The future of this admirably equipped mine is certainly encouraging. Charles Cox has taken a contract to continue work upon the Waterman tunnel, which was stopped by the death of Governor Waterman. The tunnel is in 615 feet now, and further construction will be made in the expectation of tapping the richness of the famous Blue Hill. Sid Wilcox will commence work on the Ella mine this week. This mine has paid well and could now be developed into a paying property. A part of the machinery for the new stamp-mill at the Black Eagle, on Mesa Grande, will be on the ground this week.

Shasta.

THE GLADSTONE.—*Redding Free Press*, Aug. 15: Col. Clark and family, of the Gladstone mine, were in this city Tuesday. He informed a reporter of this paper that the Gladstone was netting splendid dividends for its owner. A great deal of money has been expended to open the mine systematically, and it is now in splendid condition. Since January 9000 tons of ore have been crushed, and at present 60 tons are crushed every 24 hours. Twenty stamps are employed, with two Huntington mills, which are now used to recrush the ore passing under the stamps. The sulphurets are saved, and when there are a sufficient number of tons collected, the necessary plant for working them will be purchased.

NOTES.—It is reported that machinery is on the way to work the ore deposits in the old Donkey mine near Furnaceville. Parties were negotiating for the mining property of Mr. Carr, in Trinity county, but after the price had been fixed he flew the track. The Gladstone M. Co. of French Gulch will soon put to work three Edison electric drills—the first to be used in this county. Col. Ellis has returned from S. F., and report says that he has sold his mining property on Squaw creek to the Uncle Sam Co. Wm. F. Miller has started his reduction works this side of Middle creek on the railroad, and is working ore from what has been

formerly known as the Hartman mine. Ed Minot, who has been overhauling some of the machinery at the Walker mine, Old Diggings, informs us that the Mammoth Co., which has leased the Walker mill, has some 30 men engaged and is getting out some excellent ore. The mining venture of Messrs. Bugbee, Biegle & Bouk, who purchased and bonded the Sky Blue, Cross Bow, and other claims on the Sacramento river above Middle creek, is quite encouraging. In the shaft of the Sky Blue they are taking out ore which goes about \$25 to the sack, and in the Cross Bow, at a depth of but 25 feet, they have an eight-foot ledge. The free-milling ore they are working, being careful to save the slime, while the sulphurets, which are very rich, they will ship below. W. D. Biegle is spending almost his entire time at the mill.

Tuolumne.

SINKING.—*Tuolumne Independent*, Aug. 15: A new contract has been let in the Con. Eureka mine, near Summerville, for sinking the shaft 100 feet deeper. The contract was awarded to W. F. Bawden, late of Grass Valley, at \$14 per foot. Some time ago, Supt. C. H. Thomas discovered a continuous pay shoot in the hanging-wall, and proposes to keep sinking. When this contract is completed, the mine will be the deepest in the county, reaching a depth of 1030 feet, making the Con. Eureka the deepest mine in Tuolumne.

A SMALL STRIKE IN THE BONANZA.—*Union Democrat*, Aug. 15: Last Friday, the Bonanza mine yielded up a small bunch of gold; just how much the pocket contained is hard to tell. It is reported on good authority that the find amounted to \$2000, while on equally as good authority it is stated that between \$3000 and \$4000 were taken out. However, it is agreed all around, that there is a fine prospect for obtaining more in the near future.

NEVADA

Washoe District.

ANDES.—*Enterprise*: On the 420 level north drift from east crosscut No. 3 was extended 19 feet in quartz of low value. East crosscut No. 4 from the main north drift advanced 13 feet in quartz, yielding low assays.

UTAH.—The southeast drift from the winze station has been extended 36 feet; total length, 130 feet, continuing in a favorable formation of vein porphyry, clay and quartz.

SIERRA NEVADA.—The Kenosha tunnel has been enlarged and repaired 70 feet; total, 790 feet. On the 630 level, west crosscut No. 1 from north-west drift, 571 feet from the shaft, is advanced 815 feet, 35 feet having been made during the week.

POTOSI.—On the 1100 level, at a point 230 feet south of the Chollar incline and 75 feet south of north line, a crosscut has been started east, which is now in 14 feet. It has passed through 3½ feet of ore, the average assay of which was \$60. On the 1200 level have started a crosscut east, 100 feet south of north line, which is now in 13 feet; face in porphyry. On the 1300 level, 140 feet north of south line, have started a crosscut east, which is now in 20 feet; face in porphyry. We are opening a station at the 1400 level in the winze.

CHOLLAR.—The south lateral drift from the incline station, 1500 level, is out 13 feet; face in hard porphyry. Extracted and sent to the mill the past week 542 tons of ore worth \$24.71 a ton, as per battery samples.

UNION SHAFT.—West drift from the shaft, 900 level, has been advanced 50 feet the past week, making a total distance of 900 feet; face in porphyry.

ALPHA.—North drift from west crosscut, 100 feet north of shaft, 500 level, is out 65 feet; face in quartz yielding low assays.

EXCHEQUER.—East crosscut on north lateral drift, 150 feet north of the south line, 600 level, is out 21 feet; face in clay and quartz. The joint south drift from the Ward shaft, 1800 level, is out 215 feet; face in soft porphyry.

WARD SHAFT.—The southwest drift from the shaft, 1800 level, is out 215 feet; face in clay and porphyry.

OCCIDENTAL.—Have extracted and sent to the mill from all parts of the mine a total of 285 tons per day of ore of the average assay value as per battery samples of \$18.56 per ton. The south drift from No. 2 crosscut on the 650 level is in 20 feet, the face showing ore value assay at \$31 per ton. Have advanced the south drift on 750 level seven feet; face in quartz of low value.

Tuscarora District.

NAVAJO.—*Times-Review*, Aug. 14: The upraise has been extended 33 feet and connected. Intermediate crosscut extended nine feet.

COMMONWEALTH.—East crosscut from the bottom of winze below the 4th level has been advanced 23 feet in porphyry; expect to cut the vein in a few feet, slight increase of water.

DEL MONTE.—Third level—No. 1 north drift advanced 25 feet, showing small seam of very high grade. No. 2 north drift extended 13 feet, all in the vein, giving low assays. Have started drift from joint raise.

BELLE ISLE.—Line crosscut, 350-foot level, extended 14 feet, rock not so hard. The winze on the west vein, same level, extended 21 feet. Have started drifting south on the vein in the line crosscut, same level; progress 4 feet, showing good ore. South drift, 450-foot level, extended 20 feet. The stopes are yielding as usual.

NORTH COMMONWEALTH.—Third level. Have started to open stopes from joint raise. Hoisted 13 cars of ore; car sample assay, \$80 per ton. North drift from No. 1 winze east of shaft advanced 28 feet, cut seams of ore near hanging wall assaying \$115 per ton. Fourth level—East crosscut raise extended upward 24 feet into vein formation, giving assays of \$6.41 per ton; water increasing.

NORTH BELLE ISLE.—East crosscut from the south gangway, 400-foot level, extended 19 feet. North drift from the south line, same level, extended 12 feet, ore improving. The upraise on the east ledge, same level, extended 14 feet. West crosscut from the Belle Isle, 450 level, extended 19 feet. South drift, 500-foot level, extended 9 feet, showing some fair ore. West crosscut, 600-foot level, extended 6 feet.

Eureka District.

WILL CONTINUE TO BUY ORE.—*Sentinel*, Aug. 15: An order came from below during the week to the Superintendent of the Eureka Con. Co., to dis-

continue the buying of custom ores. A day or two later this order was rescinded and authority given to purchase ores as formerly. There was talk that the smelters were going to shut down and the company would ship the ores from its own mine to Salt Lake. This story seems to be unfounded. Preparation has been made to ship a small lot to Salt Lake merely as a test and experiment, but nothing beyond this has been determined upon. There is at the works a three month's supply of fuel and ore. It is not likely that there will be any shutting down until this is used up.

Hawthorne District.

LAPANTA.—Walker Lake *Bulletin*, Aug. 12: The stopes above the east drift, No. 6 incline, are showing ores as usual. In the east drift from the winze below the 100-foot shaft level are following down in a vein of high-grade ore, pitching south-west and showing very well.

PAMILCO.—The south drift from the tunnel is being extended on the vein, showing well. The force on the mine has been considerably increased.

CENTRAL.—Are stoping above the 150-foot level and taking out the usual amount of ore. Hauling ore for shipment at present.

MOUNTAIN KING.—The north drift on the main vein is being extended. Ledge is about four feet wide between the walls. On the footwall have about one foot of brown iron, carrying chloride of silver, in which iron, occur large kidneys of solid lead, being very high grade in silver and gold.

FAIRMOUNT.—Drifting south in the main tunnel on the main ledge, and drifting north from the bottom of the winze below the tunnel. All points are producing well.

HARTFORD.—Ledge still continues good, producing a large quantity of heavy lead.

GOLO BAR.—Some ore of good grade is being extracted.

WAR EAGLE.—Are still driving tunnel ahead to tap vein below old workings, and also stoping small amount of ore.

IOA.—Still producing the usual amount of high-grade ore.

NEW YORK.—The south drift on the vein is still being extended; vein strong, carrying some ore, and formation very favorable.

KIT VAN WINKLE (Marietta).—Main tunnel still being extended on the vein, showing about six inches of galena in the face. Are now hauling ore for shipment.

JENNY LIND (Marietta).—Main north drift from the incline is still being extended, the vein showing strong; formation very favorable.

Robinson District.

MINE SOLO.—Eureka *Sentinel*, Aug. 15: The Montana parties have finally made some arrangement looking to the purchase of Watson's Joanna mine at Robinson. The precise terms of the deal have not been given out, but everyone here regards the sale as an accomplished fact. Watson himself says he has sold his mine. The purchasers have gone to San Francisco, presumably to see what can be done with the adverse claim of Mrs. Walcott. It is to be congratulated on the acquisition of a new and strong company.

ARIZONA.

WATER SCARCE.—*Arizona Journal Miner*, Aug. 15: Water is scarce in the Hassayampa now, the supply not being sufficient to keep the Senator mill running on full time. Superintendent Helm of the Tiger M. Co. says that he expects to get the mill in operation within a month. Work is progressing satisfactorily on the new mill at the Catocint mine, and everything looks favorable for the success of the property. A \$775 bar of gold bullion was brought in yesterday from the Quartz Mountain mine. The mill is running steadily now, and regular shipments of bullion are being made. The Commercial M. Co.'s smelter, on Big Bug, is running regularly, turning out high-grade matte, which is shipped via Verde station. C. M. Clark, superintendent of the Alice M. Co., shipped a boiler and engine and other machinery out to the Silver Belt mine yesterday, and will immediately erect a mill on that property to work the ore. The Copper Basin leaching plant will start up in about ten days again. A large amount of ore has accumulated there, and a lead burner has been engaged to remain there permanently, so that the prospects are good for a long run. The concentrates taken to the sampling works from the nine tons of ore from the Mattie Adair mine gave a value of \$206 per ton. This, added to the gold saved on the plates, runs the total value of the nine tons up to about \$42 per ton, or just the assay value of it. The new tunnel of the Senator mine is now in about 660 feet. Forty-six feet was run in one week recently. The total length of the tunnel, when completed, will be about 7300 feet, and it will tap the vein at the depth of nearly 700 feet.

IDAHO.

SEVEN DEVILS.—*Weiser Leader*, August 11: Parties who have recently come in from the Seven Devils mines report a very unsatisfactory condition of affairs. In fact nothing to speak of is being done in the mines. The only work now going on is on the Bodie. The owners are putting down a shaft. No mineral is being produced, and so far as any profitable or practicable results the immense deposit is as useless as it was the day nature heaved the mass of silver and copper ore to the surface. The owners of the Standard have done considerable work this season and the present indications are that the mine will rank among the best. In fact everything looks well enough for the future, but is at present discouraging. Something may be done in the way of buying and selling properties this year, but no active mining work will be commenced. The owners of the South Peacock will sink their shaft 100 feet. The failure of the contractors to build the Snake river wagon road has had a demoralizing effect on everyone, and has caused financial loss in many instances. In fact the whole scheme of steamboat, road and everything connected with it has had an uncanny look from the first. Experts who have been looking over the Seven Devils country feel confident and even certain that immense bodies of ore in fissures exist, and wonder that no attempt has been made to get at them. The deepest shaft in the whole country is only 65 feet, on the South Peacock. The wealthy owners of the Old Peacock, Blue Jacket, and various other noted properties, do not seem inclined to do any

thing. The reported sale has not changed the condition in the least, and it begins to look to a man up a tree as though these parties were receiving inducements to keep the country back instead of developing it.

STODDARD.—De Lamar *Nugget*, Aug. 11: The new incline shaft on the Stoddard mine is now down 25 feet on the hanging-wall of the lode. The *Nugget* expert has been up to examine it and has convinced himself that the superintendent, Mr. Ludwig, is on the eve of developing that into a great property. They are in a clay streak which shows very rich in silver and are sacking ore, selected, which we think will go over \$150 per ton. The width of the lode is about five feet, and is all good milling ore. Sixteen bars of bullion, valued at \$32,000, were shipped from the DeLamar mill on the 5th instant, the final cleanup for the month of July. With the previous shipment, worth \$17,500, this makes the mill output for the month of July \$49,500. These figures are not strictly correct, but approximate very closely the amount. The estimated value of ore shipped is \$12,000.

LOWER CALIFORNIA.

AN OLO SILVER MINE.—*Lower Californian*, Aug. 15: Colonel Lane and J. M. Gonzalez, accompanied by Philip Crosthwaite Sr., have returned from a trip to the latter's ranch at San Miguel, 20 miles north of town, where they went to examine an old silver mine. The mine has not been worked for about 30 years. Messrs. Lane and Gonzalez examined the mine as much as possible and brought back with them some ore from the old dump, which they will have assayed. It was impossible to descend into the shaft, which is said to be 60 feet deep, because of the great swarms of bees which flew in and out.

SINCE A. H. Butler secured control of the Butler group of mines in Alamo, he has expressed his intention of forming a stock company to engage in the work of running a tunnel under five of the mines which lie on Tomassa hill. It is calculated that a tunnel beginning at Butler's mill and running straight into the mountain a distance of 2600 feet would tap all five of the mines at a varying depth of from 600 to 1400 feet. The Gen. Torres, the richest mine of the Butler group, so far as is now known, would be encountered at the latter depth, and it is fair to presume that a considerable ore body would be found.

MONTANA.

DOG TOWN DISTRICT.—*Helena Mining Journal*, Aug. 15: Samuel T. Green, who has been some months in the East, is again in Montana caring for the mining interests under his charge. Enroute to Helena he visited the Summit mine, in the Dog Town district, Jefferson county, the property of the Windsor Mining Co., and is enthusiastic over the work accomplished during his absence and the improvement made in the mine. The incline shaft has reached the depth of 225 feet, the ore body constantly increasing in quantity and quality. He brought in some fine specimens of hard iron-lead carbonates suggestive of the ores of Iron Hill, Leadville. Two cars of ore are now on the road to the sampling works at Helena, where they will be sampled and sold on bids. Not far from the Summit is the Ruby mine, now shipping 80-ounce ore from a body 73 feet in width. There are many leads in the district, but there has been but little development.

TOSTON SMELTER.—Arrangements are complete for blowing in at the Toston smelter. E. B. Northrup has been actively engaged securing ore, and it is thought that enough is now on hand and in sight to insure a continuous run. The outcome of this enterprise is of great importance to the ore-producers of the State.

MULLAN, BURKE AND WARONER.—Over 400 men are employed around Mullan. At least half of these receive \$3.50 per day, the others \$3. This amount equals a pay-roll of \$33,800 per month. The pay-roll at Burke and vicinity is estimated at \$50,000 per month, and at Wardner \$60,000. The census of June showed the population of Mullan and Wardner to be little over 800 for each. A pretty good pay-roll for places of that size.

WASHINGTON.

LOCATIONS.—*Conconully Outlook*, Aug. 12: From Saturday, July 25th, to August 1st, inclusive, or a period of eight days, there were 40 location notices recorded in the auditor's office. Mr. Otto Jeldness returned Wednesday from Portland accompanied by Samuel B. Gillette, the well-known mine operator and expert, and together are looking over the different mining districts of the county. The owners of the Rainbow, which has recently gained considerable notoriety as a gold prospect, have commenced sinking a shaft at the point where they discovered the pocket of free gold about three weeks ago. Parties who have just come in from the claim state that they are taking out some very rich ore, and that their pay streak is widening out as they go down.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

- 457,388.—VEHICLE RUNNING GEAR.—Warenskjold & Burgess, San Diego, Cal.
- 457,543.—HEATING ATTACHMENT FOR GAS BURNERS.—G. A. Williams, S. F.

The following brief list, by telegraph, for August 18, will appear more complete upon receipt of mail advices: August 18.—Pacific coast patents have been granted as follows: California—Edwin B. Dennison, Pacific Grove, fluid pressure brake; Joseph P. Magney, Oakland, sash balance; William Milbourn, Los Angeles, device for utilizing wave force; James R. Phelps, Sacramento, harness; William J. Rogers and J. Howe, Laurel, in-vented tooth for saw; Charles R. Sahn, St. Helena, dental articulator; Richard D. Schroeder, San Francisco, machine for shelling liquids; Paul Seiler, San Francisco, locomotive; Francis V. Simmonds, San Francisco, pump; Edward T. Stoen, San Francisco, window chair; Oliver Vannorman, Los Angeles, carburetor.
Washington—Edward F. C. Hunsard, Colfax, brush; Fred Lundberg, Tacoma, water-wheel; Thomas W. Moore, Plandfield, N. J., assignor to T. W. Moore Jr., Fair Haven, harness.
Idaho—Thomas Rowe, Ketchikan, jigger.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAGON-BRAKE.—Frederick M. Dohbel, Purissima, San Mateo Co. No. 457,544. Dated Aug. 11, 1891. This invention relates to that class of wagon-brakes in which the swinging brake-bar is operated by connections with a rock-shaft which is itself operated by the brake-lever in front and intervening connections. Novel means are used for adjusting the brake-mechanism to compensate for the wear upon the brake-blocks. The object of the invention is to provide for a greater throw-off of the brake-shoes from the wheel than is usual, and at the same time to use a powerfully acting block; and a further object is to provide a simple and convenient means for adjusting the brake-mechanism when desired.

PEA-SHELTER.—Edward C. Moulton, S. F. No. 457,538. Dated Aug. 11, 1891. This improved apparatus for shelling peas is especially designed for use in families and for operating on small quantities. It consists essentially of a central shaft or cylinder, having radially projecting pins or spokes fixed therein, an exterior concentric enclosing drum journaled upon the projecting ends of the shaft and having its surface pierced with holes for the escape of the peas, a stationary exterior inclosing case or cover, in conjunction with a chute inclosing the lower portion of the drum by which the peas are received and discharged, and a combination of gearing by which the interior hub and pins are rotated in the opposite direction from the inclosing perforated drum. When the peas have all been shelled and discharged, the cover is thrown back, the removable section of the drum taken out, and by turning the drum downward and oscillating the drum once or twice, the hulls of the peas will all be discharged and can be removed, leaving the drum ready for another charge. No ribs or projections are needed upon the interior of the drum, there being a sufficient frictional lifting power to hold the pods against the revolution of the interior pins or arms for the purpose of breaking the pods and shelling out the peas without otherwise destroying the pods or breaking and splitting the peas.

Mining Share Market.

The mining share market the past week was of such a choppy character that the few dealers that are left found it hard sailing. Unless a change is made soon, the majority, if not all of the small dealers will be founded. On Saturday and Monday, under the leadership of Con. Virginia, the North Ends made an advance, but the other groups either remained steady or else shaded off. On Tuesday, Savage spurred up, but the move was short-lived, as usual. Since Tuesday, the market fluctuated downward, with Potosi suffering the most. The action of this stock seemingly gives color to the belief among many that the pool was disappointed in selling it off, when a strike was reported to the East. Well-informed miners do not look for much from the east drifts, but they do expect good results from drifts run to the west, for the West or Red lode, after which they will run lateral drifts and then crosscuts for working. As this will take both time and money, it is human nature for the pool to try and deal out the stock by false moves based on work to the east, and if successful in selling out enough, then commence drifting west for the Red lode, and make outside shareholders pay the expenses. The pool is educating the public to look for nothing but assessments, while the mines are being looted, and consequently the latter is learning to sell when a profit is in sight, and very often even when netting a loss, for the fear of sustaining still heavier losses. Under these circumstances, it is hard to make a successful deal. It now looks as if to make a successful deal, the tactics must be changed in such a way as to inspire confidence.

The share market opened this (Thursday) morning dull and weak, after the call prices shaded off under light trading, but toward the close there was a stronger tone. It looks as if the little stock that was sold on the last spurt has about been taken back at lower prices, which, if the case, the pool will make another up move very soon. We still adhere to our previously expressed opinion that this is an up market, but setbacks must be expected.

Last week's letter from Con. Virginia was a decided improvement on former letters. It gave more detailed information.

From the Comstock mines our advices report that in Con. Virginia, on the 1800-foot level, they had run into lower grade ore, with the ledge more broken. This does not indicate but that they have higher grade ore on that level. On the 1700-foot level connection will be made soon with Best and Belcher. Experienced miners look for good results when they start drifts to tap the upward continuation of the rich ore taken out on the 1200-foot level near the Best and Belcher. After they strike the ore they may have to make air connections before crosscutting or making developing work. The work in Sierra Nevada ought to be approaching an interesting point, as is that in Union on the 900-foot level. In Best and Belcher more interesting work, if not started, ought to be commenced soon. In Savage and Hale and Norcross a large amount of exploiting is under way. Judging from Virginia City papers, we should think that the Potosi and Bullion managements are about ready to set the "world on fire," but it may be all cry and very little wool unless they change the work. In Alpha, Exchequer, Con. Imperial, Yellow Jacket, Confidence and Challenge, the usual work is reported. In Crown Point work is resumed on the 500-foot level. In Belcher they have made a strike, but it is, of course, no good for it is water, yet even this sometimes leads to something better. Overman continues to report low-grade ore. It seems as if they have had time to get the stock back which was sold at higher figures several months ago.

From the outside mines our advices are very favorable from the Bodies and Tuscaroras. In next month they will begin to crush more ore.

The Drexler crowd of operators are outspoken in their belief that no new discovery of ore will be made on the Comstock, and while acting on this impression they do not buy, but sell on every jump in prices. Their views are said to be grounded on the unpropitious time of the year for a deal, and unless the times are favorable there is no use of making a new strike; besides, they say that to make a development now would operate against expected silver legislation in the 52d session of Congress. Mr. Drexler and his followers, it is said, have heretofore been quite successful in their bear moves against the pool.

* Assessment added.

MECHANICAL PROGRESS.

Cupola Practice.

The cupola is a furnace to melt iron, in a foundry. It has been known for centuries, and is carved on Egyptian monuments 4000 years old. The founders of that time are represented using bellows very much similar to ours, to produce the strong blast necessary to melt metal. The metal to be melted was thrown on the top of a pile of fuel which had been previously lighted. The blast was then introduced at the bottom, through one or more pipes or ducts called tuyeres. This is what we are doing yet, in the modern cupola.

Some of the old cupolas were made of stones, some of wooden staves, some of bricks hooped like barrels, and were lined inside with stone, fire-clay or refractory sand; later they were made of cast-iron staves, and only recently of boiler plates riveted together. It is but lately that special study has been made of the proportional dimensions of the cupola.

At the present day many large cupolas are used for small meltings, and small ones for work much larger than their true capacity. The proportions and sizes of the furnace, the quantity and quality of fuel, metal and flux, and the quantity and intensity of pressure of cold or hot blast produce different results.

In the smelting furnace, the iron ore is transformed into pig iron.

In the Catalan furnace, wrought iron is produced directly from the ore.

In the foundry cupola, pig iron and scraps are melted to be cast in molds to make castings.

In the steel works, the molten metal from the cupola goes to the converter to be transformed into steel.—*Scientific Machinist.*

WHAT IS DUE TO MACHINERY.—It is a question whether many perious have formed any correct idea of the difficulties which were met with 60 to 70 years ago, in making suitable tools and machinery from metal. There were no planing, boring, or shaping machines; the turning lathe and the drill-borer were about all the devices which could be called into use by the mechanic of that time. Inventors had to make by hand the machines they invented, with the aid of other machines in making the individual parts. They had to invent some tools so as to be able to make certain parts of their invented machine. When our celebrated machinist, Clement, entered a shop as master at London in 1814, he found the tools so poor and defective that he had to spend days in making such ones as were needed. James Watts, the inventor of the steam engine, could not get his first machines in working order in consequence of a lack of some contrivances. The first cylinder which he had cast was not tight, and was on one end five millimeters wider than on the other. A good cylinder should not show more difference in width than one-half millimeter. And the cost of work at that time was extravagant. Whitworth, one of the oldest manufacturers of working machines in this country, said that the polishing of cast iron cost 12s. per square foot 40 years ago, as the work had to be done by hand. The manufacturer, Perry, paid for the first steel pens about 5s. a piece, but still these pens were not as good in quality as those which are made to-day. After factories had been established, the price of a steel pen was about 4s. 6d., then 2s. 6d., and then 1s., which price was kept up for some time. To-day one can get a gross for that price; all owing to our perfect machinery.—*London Machinery.*

THE TESTING OF IRON AND STEEL.—If a fracture of iron gives long, silky fibers of leaden grey hue, the fibers cohering and twisting together before breaking, it may be considered a tough, soft iron. A medium, even grain mixed with fibers is a good sign, a short, blackish fiber indicates badly refined iron. A very fine grain denotes a hard, steely iron, apt to be cold short, and hard to work with the file. Coarse grain with brilliant crystallized fracture, and yellow or brown spots, denotes a brittle iron cold short, working easily when heated. The iron welds easily. Cracks on the edges of bars are a sign of hot short iron. Good iron is readily heated soft, under the hammer, and throws out but few sparks. Nitric acid will produce a black spot on steel.

THE VALUE OF MECHANICAL PAPERS.—It is astonishing to find, at this time of the world's advancement, so many mechanics who do not read the mechanical papers. A trip through the different sections of the country will reveal some startling facts in this direction, though the papers are penetrating farther and farther each year. Many men in cities, as well as the out-of-the-way places, neglect the opportunity that is offered by any first-class paper of becoming acquainted with the current thought and the latest developments of mechanics at a remarkably low figure, considering the value received. Not only are we brought in contact with the latest and best practices, but are afforded an opportunity not otherwise to be obtained, of becoming familiar with the latest types of machinery for all purposes. It is a valuable educator to be shown the new machines as they are brought out, and the descriptions make their actions intelligible to all that read carefully and study the data that help so much to make a machine plain to the

reader. This lack of interest is not confined to the shop, but extends to the proprietors of the same. One would naturally think that it would be of almost vital interest to the owner or manager of an establishment to keep up with the times, and know what others are doing in the same line; it is easy to get behind the procession, but not so easy to catch up again. It is not necessary to say that the reading man, mechanic or otherwise, is the one that not only enjoys life, but keeps abreast of the most advanced thought and practices in all directions.—*American Machinist.*

A RECENT MECHANICAL INVENTION claims to meet the well known difficulty which often presents itself in the riveting of boilers, namely, the bulging of the rivet in the center, resulting not only in the separation of the plates, but sometimes in the splitting of one or both of them. In order to obviate this defect—wholly, it is said, very seldom becomes known until the boiler is in actual use—a rivet has been contrived which has a thinned waist, to allow for expansion, and the nucleus of the burr already shaped. By this arrangement the burr is practically started before it receives a blow, and the fiber of the metal is already inclined toward the position it will be ultimately forced to assume. The effect or result of this change of form is that the rivet holes become properly filled with the slightly expanded waist of the rivet, the plates are closely united, the burr is well formed, and there is no danger of the plates cracking, the riveting being also effected with fewer blows, thus economizing labor.

BRIGHT DEVICE FOR FIXING A PROPELLER SHAFT AT SEA.—The emergencies of marine disasters often tax the genius of engineers to an extreme, and the manner in which a large British steamer, with a broken propeller shaft, was set right not long since at Algiers, is worthy of preservation in mechanical history. Both the shaft and the tube through which it passes at the stern were broken, and the vessel lay in port until the arrival of another shaft and tube from England. It was then found that the tube was larger than the opening in the stern. The tube was fastened to one of the coupling faces of the sound portion of the shaft, just as it would be hooked in a lathe. The ship's engine was run slowly, and by means of an improvised slide rest, the tube was turned down to the proper size. The tube and shaft were fitted in place, and the steamer resumed her voyage without having been placed in dock, the stern being raised out of water by shifting the cargo forward.—*Scientific Machinist.*

WIRE FINER THAN HAIR.—We are at work just now, said a correspondent of an exchange the other day, on some pretty small wire. It is 1-500 of an inch in diameter—finer than the hair on your head, a great deal. Ordinary fine wire is drawn through steel plates; but that wouldn't do for this work, because if the hole were away ever so little it would make the wire larger, and that would spoil the job. Instead, it is drawn through what is practically a hole in a diamond, to which there is, of course, no wear. These diamond plates are made by a woman in New York, who has a monopoly of the art in this country. The wire is then run through machinery which winds it spirally with a layer of silk thread which is .0015 of an inch in thickness—even finer than the wire, you see. This wire is used in making the revolving instruments of ocean cables, the galvanometers used in testing cables and measuring insulation of covered wires.

A FEW THINGS BRIEFLY PUT.—A correspondent of the *Scientific Machinist* writes: If the few points given below will be considered useful to your readers, I shall feel that this letter has not been written in vain. In grinding and setting tools for lathe, planer or any kind of machine work, give the least possible clearance to the heel of the tool. Always have the cut on the top or front of tools. In boring castings with blow holes, have the face of the tool wide, so that it will have a bearing on solid metal while passing over blow holes. In grinding flat drills, do not have a thick point, or sharp side, as a thick point will not follow the center and will work hard. There is no more strain on the point of a drill than there would be on a drill the size of the point. The sharp sides of a drill will make the hole larger than the drill calipers. Give the least possible clearance to the end of the drill, and you will find that it will stand hard work.

STEEL AXLE BOXES.—A foreign firm has recently patented a machine which does away with a large annual loss by making a wrought-steel box that is not expensive. The steel is delivered to the machine in plates a half-inch thick, and the box is produced by a series of presses which cut the metal to the required shape, and the machine then folds the pieces to form the box. The boxes are much stronger and much lighter than the old-style cast-iron boxes.

WELDING WIRE CABLES.—A Brooklyn cable road has employed a welding machine to join the sections of its cable, and it has found that the tensile strength of the cable is greater at such junctions than anywhere else.

There are nearly 6000 pieces in a modern locomotive.

SCIENTIFIC PROGRESS.

The August Meteors.

During the past week the earth has passed through what has for many years been considered a zone, or belt of meteors, which revolves around the sun in a very elliptical orbit, extending, in its apophelion, to a distance in space far beyond the orbit of Neptune, our outermost planet. This belt or zone is not simply a cluster of meteors revolving around the sun as a planet does, but it is a belt or stream every portion of which is filled with meteors—more dense or in greater numbers in some parts than in others. At each annual revolution of the earth our planet plunges into and passes through this stream of meteors. The time occupied in this passage is from three to five days, less or more, and as the earth moves at the rate of 68,000 miles an hour, the width or depth of this space must be many millions of miles.

Two Great Meteor Belts.

As is generally known, we have what we call the August meteors and the November meteors. The long time intervening between the two indicates that there are two of these great streams. The display of meteors in some years is much greater than in other years; hence it is naturally inferred that there is a great irregularity in the density of these streams, as the earth necessarily encounters them each year at quite different and distant points. When the earth passes through a dense portion of the stream, the meteoric exhibition is really wonderful. In some years, as in 1833, for instance, the heavens seemed alive with meteors for several hours, hundreds being in sight at every moment of time. The distance of these meteors from each other, when in a dense portion of the stream, has been computed as not more than 100 miles, perhaps much less. The November stream is considered the largest and most dense.

The First Recorded Appearance

Of these annual meteoric displays was A. D. 811. They have appeared with great regularity down to the present time, with the exception of a break of 83 years between 841 and 924, and another of 310 years between 933 and 1243. These failures may have occurred from breaks in the ring or possibly a failure to record or notice their appearance.

There Are Many Smaller Belts.

Careful observations have shown, quite conclusively, that the earth passes through something like 100 of these meteoric streams each year—all except the two first noticed being extremely small; but yet quite well defined by careful observers. The orbits of most of these streams have been carefully calculated by astronomers. In addition to the well-defined streams, every portion of space through which the earth moves contains meteors in greater or less numbers. There is not a clear night in the whole year on which many meteors may not be seen. It has been estimated that not less than 400,000,000 meteors are encountered by the earth during each annual revolution around the sun.

What Are Meteors.

It is well known that meteors are fragmentary portions of matter, similar to that of which the earth is composed, and that they revolve, like the planets, around the sun, in more or less elliptic orbits. They are invisible until they enter the earth's atmosphere, when the friction of the air produces great heat, which renders them luminous. By far the greater number are so exceedingly small that they are converted either into vapor or dust in a second or two. It has been calculated that fully 20,000 tons of meteoric dust fall upon the earth's surface every year. The velocity of meteors is generally very great—much greater than that of the earth. Like comets, they move in all directions, and appear in every portion of the heavens. Whether they are fragments of disrupted comets or planets or simply aggregations of cosmic matter, will probably never be determined. But that they are made up of matter such as constitutes our earth is quite certain.

They Vary Greatly in Size.

From a few grains or less in weight, up to immense bodies of from a few feet to many thousand feet in diameter. No line of demarcation can be shown between the tiniest "shooting star" and the largest meteor. They differ from each other in size, color, composition and velocity. When they fall to the earth, they are termed "aerolites." One of the largest aerolites yet discovered weighed 1,635 lbs., and is preserved in the museum of Yale College. One has been found in Siberia, consisting almost entirely of iron and nickel weighing nearly a ton. The National Museum of Brazil contains the largest aerolite known, which weighs 11,800 pounds. It may be considered a little singular that of all the aerolites which have fallen on land and sea, there is only one record of any fatality to man or beast.

CHEMICAL PROGRESS.—In no department of science is there a greater indication of progress than in that of chemistry. This has become a fact largely from the circumstance that the recent progress of chemistry has been so great as to force its way into nearly every economical industry. There is at this day scarce an indus-

try carried on upon a large scale which does not require the constant presence of a chemist. One of the latest achievements in this direction is the artificial production of musk, a process for the successful production of which it is said has lately been brought forward in Germany, and of a character such as to give to the article a positive commercial value. It appears in crystals of a yellowish white color and of a strong musk odor. For perfumery purposes the crystals are dissolved in alcohol, with the addition of a trace of ammonia or carbonate of ammonia. This solution, which is compared to tincture of musk, is described as surpassing the latter in the intensity and penetrating power of its odor. The product to be used in perfumery must previously be diluted in a homeopathic manner. In manufacturing this article, the method pursued, according to the official record, is to hold in a reflex condenser toluol or toluene, with one of the following halogen compounds of butyl, viz., chloride, bromide, or iodide of butyl, along with chloride or bromide of aluminum; the resulting product falls back into the water in the still, where it is decomposed and distilled in a current of water vapor.

THE AERIAL OCEAN.—It seems that on the surface of the earth we are living at the bottom of an ocean more than 100 miles deep. It is the aerial ocean, and in some respects it is similar to the Atlantic or the Pacific ocean. It is thought by some of our foremost scientists that there is a well-defined surface to this ocean, on which are great aerial waves, exaggerated forms of what we see on the surface of water. Other scientists, however, believe that the density of the air gradually diminishes in proportion to the distance from the earth's surface, and that the extreme upper limits is indistinguishable. However this may be, we know that the air is a fluid body, that it has weight and elasticity, and that every square inch of it weighs 15 pounds. This means the weight of one square inch at the bottom, reaching up to the top of the aerial ocean. There is, consequently, an immense air pressure on every person, but we don't feel it because the pressure is equal on all sides of us. If it were only downward, it would fasten us to the earth as tightly as a fly caught in a glue pot.

HOW TO PRESERVE FISHES.—Whenever it is possible, fishes should be put into the preserving fluid as soon as they are taken. After remaining in it a few hours it is necessary to take them out, rub off the mucus and make incisions in the belly, and if the fish is large, on the sides, to allow the fluid to penetrate thoroughly. For the first bath a mixture of equal parts of alcohol and water is suitable. The second bath, however, must contain a larger per cent of alcohol—not less than 70. In order to insure perfect preservation, the specimens must be examined every few days until the fluid has completely saturated them. For final preservation the writer prefers equal parts of alcohol, glycerine and water. In this mixture the fishes remain flexible for study and retain their colors longer than in any other fluid known to him. Whenever the preservation becomes discolored and organic matter collects in the bottom of the jar or tank, fresh liquid must be substituted for it. Eternal vigilance is the price of a collection of fishes.—*Forest and Stream.*

MEETING OF THE AMERICAN INSTITUTE OF MINING ENGINEERS.—The sixtieth meeting of the American Institute of Mining Engineers will be held at Glen Summit, Lucerne county, N. Y., beginning October 6, 1891. Special discussions are expected on the two following subjects: 1. The Preparation and Utilization of Small Sizes of Anthracite Coal; 2. Practical Uses of Concentrated Iron Ores.

IS THERE A GLACIER IN SAN DIEGO COUNTY? Binning explorers claim to have found a mighty mass of moving ice in a deep canyon on Grayhawk mountain. The formation is about 25 feet thick and 60 feet wide. Immense rocks have been pushed from their beds by the moving of the great ice mass and lie on top of it. Sun does not reach the ice more than one hour a day.

JUPITER A SUN.—The late observations on Jupiter by Seel, Zolner and Browning are said to lead to the conclusion that this largest planet in our system is in reality a sun to its system of moons. The planet appears to be in an incandescent state, self-luminous, and giving off heat in quantities sufficient to afford much warmth to its attendant orbs.

WRITING BY TELEGRAPH, now so much talked about, was tried in France 20 years ago. Signatures were sent from Paris to Paris, and the experiment was considered entirely successful. After that the whole matter was suffered to fall into abeyance.

A NEW GASEOUS COMPOUND, it is said, has recently been discovered by a German professor, which is made up of oxygen and hydrogen. It dissolves metals, and with silver and mercury, it forms powerful explosives.

A NEW MINERAL has been discovered, to which the name sanguinite has been given. It is a bright-red in color by reflected light, and upon analysis is found to contain silver, arsenic and sulphur.

GOOD HEALTH.

Vigor from the Bath Tub.

Nellie Burns, in the *Country Gentleman*, says: I truly believe there is no other agency so good for recuperating the human system from the effects of work and heat during the hot weather as the all-over bath; and no one needs more the benefit of this free stimulant of nature than the hard-working farmer and his wife. He comes from the field at night, tired. His clothing is saturated with perspiration and performed by the attending foul odor. To go to sleep in this condition is uncomfortable, unhealthful and not neat; and yet this is what many do, and when continued for weeks the enervating influence on the system is sure to be felt.

Now, instead of going to bed in such a condition, the tired farmer should be refreshed by a thorough bath, and fresh clothing should be worn during the night. (The day clothing should be hung up in an outer room to air and dry.) Now behold what this bath does: It induces sleep—a sound, sweet, restful sleep. It has a soothing influence on the disturbed nerves throughout the tired body. It is quieting, refreshing, invigorating; and under its influence, on arising in the morning, the body is free from that stiff, tired feeling, which even sleep does not always banish from those who labor hard.

But to no one does this daily, all-over bath give such benefit as to the worn-out housewife. Confined as she is in the warm rooms at such heating work as washing, ironing and baking, and such nerve-wearing duties as caring for a baby and little children, and listening to their frequent cries, she often becomes so nervous and tired by the time the day is over that often in her secret soul she doubts if life is worth so hard a struggle. To such ones I recommend earnestly the all-over bath before retiring, occasionally throwing a handful of salt in the water as an added stimulant. Don't fresh sleeping garments, and see if comfort and fresh life are not to be found in this simple agency.

An abundance of underwear for summer use, so that frequent changes may be made, is a necessity, both for health and comfort. Although this makes the washings larger, they are no harder, as the garments are less soiled than when worn longer.

A PRETTY CUSTOM—LINING GRAVES.—A simple method is in vogue in Buffalo, where most of the openings for interments are in a subsoil of firm clay. The grave is prepared specially for it by being dug four to six inches larger around on each of the perpendicular sides and ends. Evergreen branches only are used for the first or rough lining and for covering over the fresh pile of ground. Hemlock is preferred, as it lays flat and smooth, covers quick, and its deep green is useful for the purpose. No. 16 wire cut in suitable lengths, and bent hair-pin shape, pins into the soil readily and firm enough, and fastens on the flat branches nicely. This is begun at the bottom of the grave, working up thence till reaching the top, where all can be finished off smoothly with the same material, and strings of smilax be added, either drooping down or looped around the grave and caught up by clusters of flowers; or, with this firm and green ground-work, flowers can be employed extra in clusters and bunches in a variety of ways and to any extent. We have seen elaborate work done by using adiantum foliage and choice flowers freely in finishing. In this case, the fern plants were used, the halves of roots back of the green and out of sight.

SNEEZING.—Although sneezing is a purely involuntary act, it is possible in some measure to guard against its attacks. In the case of a fully developed cold, the sufferer must necessarily submit to the infliction; but, as to the sneeze casual, it would appear to have influence only in a listless or weakened condition of the bodily powers. People seldom sneeze when their faculties are in full tension. Great nervous excitement will hardly admit of the relaxation of a sneeze; hence we often find a chrouh, a hall or a theater, filled with an audience ready to indulge on the smallest provocation. They are in the passive and recipient mood. On the other hand, a strong, nervous concentration possesses the preacher, lecturer or actor. His faculties are girded up for the feat before him, and he can, at least, temporarily defy the draughts that make martyrs of some of his hearers.

DEATH FROM A FLY.—A fly caused the death of a man at Vienna. He was walking the street when the insect suddenly took a position on his forehead. As soon as it left, a swelling appeared, which soon after gave the man such a pain that he went to a physician. The doctors said blood-poisoning had set in, and the man died during the night.

DISAPPOINTED.—It is said that Prof. Koch has resigned all the public offices held by him. This step is associated with supposed disappointment over the unsatisfactory results of his discovery of "tuberculin." The Academic Senate will bestow an honorary office upon him, permitting him to lecture whenever he chooses.

MOLE ON FACE.—A hairy mole which is still growing should be removed at once, even at

the risk of some injury to the skin. It is now probably no more than a plexus of capillary vessels, with only a small supply of connective tissue. There is also a likelihood that it has not yet involved the skin. If this be its condition, the skin over the tumor may be reflected in flaps, and the tumor itself strangulated with ligature in one of the usual ways. The flaps should then be replaced, and the result will be a minimum of cicatrix and deformity; but if the veins be allowed to grow, it will become a large, highly vascular, erectile tumor, probably invading and involving the skin, liable to profuse hemorrhage if injured, yet still quite amenable to treatment, though of a less simple kind. The modes of treating such are numerous, and are continually increasing.

USEFUL INFORMATION.

A VESSEL BREAKS IN THE CENTER.—One of the most remarkable mishaps that ever befell a vessel anywhere, recently happened to the schooner *Michigan* unloading coal at Erie street dock of E. L. Hedstrom & Co., in Chicago. While lying at the dock the vessel broke in two with a report that sounded like that of a cannon. At midships the boat is well out of water, while both the bow and stern lie deep in the river, thereby forming a small rainbow. The coal unloaders had taken out the coal from the midships section, leaving it in both bow and stern. The captain had repeatedly protested against the way the work was being done and said that it would break his boat in two, but no heed was paid to his warning. The oak planking was pulled apart and the pine planks forming the deck, either pulled apart or pulled in two by the great force of the collapse. The *Michigan* is one of the largest schooners on the lake, being 271 feet long and 41 feet wide.

MIXING CEMENT.—All cement when mixed with sand to a proper consistence for mortar will fall to pieces if placed in water before setting is commenced. Pressure while setting, or the degrees of thoroughness of mixing, or the gaging the proportion of the water used, and other considerations, may easily effect the results to the extent of 50 per cent, or even more. The use of cold water for mixing is not injurious, only it retards the setting. Sand also retards the setting. Cement by itself would set in half an hour, whereas when mixed with sand it takes some days before it becomes even at all hardened. When one part of sand is added to one part of cement, the strength becomes diminished by about one-half. Two parts of sand to one of cement averages about one-third the strength of pure cement. Slaked lime again retards the setting of cement.

TO PREVENT RAILWAY COLLISIONS.—A simple and ingenious device for preventing railway collisions has been invented by Mr. W. H. Waddell, and it has been successfully tried on a section of the Baltimore and Ohio Railroad. It gives the engine driver warning, conveyed as follows: A secondary track, laid in sections of desired length, is laid inside the regular track on insulated posts, a branch connecting with a battery in the cab. When two trains are in the same section, the circuit is completed, and the alarm given. The cost of the apparatus, including 12 lb rail, will, it is said, not exceed \$700 per mile.

ANOTHER GUTTA SERENA SUBSTITUTE.—Another substitute for gutta serena has been discovered in South America. It is in the form of a fluid of solidifying properties, is insoluble in water, and hardens and softens with cold and heat. It will retain any molded shape, can be cast into very thin sheets, and will take the minutest impressions upon its surface. It is derived from a plant which grows wild in the Conaco district. In its natural state it resembles chocolate in color when dried, though while flowing from the tree it is white.

THE COTTON SEED BUSINESS.—In the year 1880 there were but 40 cotton-seed mills standing in this country. Since that time the number has been increased to 194, with an aggregate capital invested of \$20,000,000, against \$3,500,000 at that time. The antiquated and inefficient machinery in some of the mills has been found to be of no special use, and consequently the mills have been abandoned, and the business concentrated in the better equipped mills. The cotton-seed trust, formed some time ago, acted on this principle, and a number of its mills are thereby idle.

HOPE FOR TELEPHONE USERS.—There is Boston authority for the claim that the Western Union Telegraph Co. intends entering the field against the Bell Telephone Co., as soon as the original telephone patent expires, which will be in the near future. The Bell people say they are protected against competition by the transmitter patent, which has several years yet to run. If these two great corporations should get into a fight the public would be directly benefited by cheaper rates.

COPPER PRODUCTION.—The census bulletin just issued shows that the production of copper in the United States greatly exceeds that of any other country in the world. According to the statistics, the total production of copper in the United States in 1889 exceeded 113,028 tons. At the head of the five chief copper-pro-

ducing regions in Montana, with a yield of \$9,114 tons in 1889. Next comes Michigan with 43,728 tons, then Arizona with 15,794 tons, New Mexico with 1843 tons, and Colorado brings up the rear with 585 tons.

ELECTRICITY.

ELECTRIC SHOE-POLISHERS are coming into practical use and are exciting much curiosity as well as admiration by the glittering effects they produce. The machine consists of one whirling brush, attached to a flexible shaft, which the bootblack applies by hand. But this latest development in the way of a polisher calls for no manual labor whatever. The shoe thrusts his foot into the machine and draws it out, the polishing being completed instantly. The contrivance consists of a heavy base of iron and oak, one on each side of which is a circular brush revolving on a vertical axle. In front of these brushes, and so closely placed that the bristles of the three intermingle, is a third brush, which moves horizontally. The shoe to be shined is placed on a little platform, which slides forward between the first two brushes, and as the third brush gets into its work, the shoe comes out a glossy thing of beauty. The shafts of the three brushes are self-adjusting, somewhat after the fashion of the rocking-horse machines wherewith the inglorious hog is denuded of his bristles; and it matters not whether the shoe that goes between them is of No. 7 calisher or No. 16, the polish comes all the same. The young genius who built this machine has applied for a patent, and is now working on a mechanical "dancer."

ELECTRICAL BATHS are the last new thing in fashionable medical circles, and are said to cure every form of nervous hysterical disorder. The process takes place somewhat as follows. The patient is first divested of all his garments and wrapped in a sheet. Then a jet of cold water is directed on to the head. He is then told to step into a wooden box that closes tightly round the neck. An electric current is now turned on upon the body, and produces an exhilarating effect. There is also an aperture through which the attendant can pass a sponge, forming one terminal of an electric current, the body being connected with the other terminal. This sponge is held on any specially afflicted spot. After the "bath" is over, the patient is thoroughly rubbed and dried, and while the steaming, electrocising and rubbing process is going on, a cold-water compress is kept upon the head to preserve it cool and fresh.

ELECTRICAL TREATMENT OF METALS.—An interesting exhibition was made in Boston, on the 8th inst., of processes of forging and tempering by electricity of obdurate metals. One experiment was the melting into liquid form of a bar of steel an inch in diameter and 12 inches long in 45 seconds without the temperature of the room being raised a single degree from its normal condition. Another thing shown was the making of a steel railroad spike. A bar is cut into the required length. The pieces are then passed through an electrical machine, where one end is heated, and then go to a die, which shapes a head on the heated end, the point being compressed into shape without heating. Another exhibit was the forming of an auger screw, a flat bar of iron being fastened in the machine at two ends and heated almost instantly, and then twisted into the required spiral.

AMALGAMATING GLASS WITH METALS.—Word comes from Vienna that the electrical world is greatly excited over the discovery made by Capt. Franz Walter, the lecturer at the military academy, of a method of amalgamating glass with other metals besides platinum. This invention will revolutionize the manufacture of electric lamps, in which the use of platinum will be entirely discarded, thereby doing away with the principal source of expense. Capt. Walter asserts that by his method lamps can be manufactured 50 per cent cheaper than in the old manner, and that the breakage would not amount to five per cent.

A NEW ARC LAMP.—A new arc lamp has been invented by a Pittsburgh man, which, it is said, has decided advantages over all other lamps. Instead of the carbons being made pencil-shaped, they are made in the form of wheels, which are placed at right angles to each other. One wheel is larger than the other, and by an automatic arrangement within the lamp they are kept constantly revolving. It is said that the lamp is cheaper and simpler than the old-style lamps, while its endurance is greater, the claim being made that the lamp will burn continuously for 500 hours without a renewal of the carbons.—*Industrial World.*

ELECTRIC LIGHTING.—What appears to be an authentic report comes from the chief electrician of the postoffice at London, as to the relative cost of gas and electricity as a means of illumination. His figures show that gas, the equivalent of 4000 candle power, would cost 25 cents, while an arc light of the same power would be but 16 cents, but incandescent light to that extent would cost 50 cents, and taking nine principal English cities for an example, he states that the value of gaslight, as paid per annum by the consumer, would be \$225, while the electric lights would cost \$250 on the same conditions.

ENGINEERING NOTES.

A CURIOUS TYPE OF ARCH CONSTRUCTION.—A late French technical journal describes and illustrates a curious form of arch construction, as applied by the Persians at Khoreabad. These arches have semi-circular, elliptical or ogival sections, and rest on vertical abutment walls of brick. Their peculiarity lies in the oblique arrangement of the brick rings. The ancient masons apparently did not use centers; so they started the first ring against a mass of brick masonry built with a face inclined at about 60° degrees from a vertical plane. All succeeding rings were then supported against this first one, and all had this same inclination from the vertical. They did not use a key-stone, but filled the opening left at the crown with brick clay, firmly rammed. The bricks used were comparatively thin and broad, and were shaped to conform to the lines of the arch. These drainage channels, so named, were evidently well backed originally with earth.

LAYING CONCRETE UNDER WATER.—A simple process of lowering concrete under water by means of what may be called the "continuous hopper," has been used in constructing the piers of the large railway bridge over the Loire. The difficulty was to prevent the contact of the concrete with water before deposition. A tube was suspended by a crab winch resting on the usual framework, and while the lower end rests on the ground, is filled with concrete. It is then raised and part of the concrete allowed to run out and settle itself. This, which is the whole of the process, can be repeated at any part within the framework. It has proved both more effective and cheaper than the old process of depositing by boxes. Neither concrete nor cement can be emptied in water loose with good results, but must be conveyed to place in boxes or bags.

RAILROAD BRIDGES IN ENGLAND.—Many of England's railroad bridges, which were constructed when the equipment was lighter, are considered not strong enough for the traffic now going over them. Sir John Fowler, the engineer who built the great bridge over the Firth of Forth, recently made an investigation on the Brighton railway, and on the strength of his report the company has decided to rebuild half of its bridges. The other railways are represented as being in precisely the same plight. The bridges, Sir John Fowler declares, were built of cast iron for the light rolling stock which was then in use. The present locomotives, however, are so much heavier that they require stronger bridges, constructed of wrought iron or steel.

METHOD OF ACCURATELY MEASURING STRAINS ON IRON BRIDGES.—A French engineer has devised a method of accurately measuring the strains on iron and steel bridges, using for the purpose two brackets, which are attached, some distance apart, to the beam to be tested. On one bracket is a water chamber, closed by a flexible diaphragm, and connected with an open tube, which serves to register, by the height of the tube, any pressure made on this diaphragm. One end of a pointed rod is connected with this metal covering to the water chamber, while the other is suitably joined to the other bracket. It is thus seen that any elongation of the bridge member causes a motion of the diaphragm, and a fall of the water in the fine tube.

THE SUZ CANAL TOO SMALL.—The most important deduction to be obtained from the annual report of M. de Lesseps to the shareholders in the Suez canal, is that the facilities of the water way are rapidly falling behind the enormous increase of traffic, and that before long, probably even the relief afforded by the recent diminution in the time required for transit will be found insufficient. The work of widening the canal is already well under way. About 15 miles of its length has already been widened and the work is being vigorously prosecuted.

THE SOUTH PASS JETTIES.—According to the last report of Major Quinn, U. S. Engineer Corps, shows a 26-foot channel, 50 feet wide, beyond the sea ends of the jetties. Turning to the eastward of this direct channel, however, there is another with a depth of 26 feet for a width of 400 feet and 30 feet for a width of 120 feet. At the head of the South Pass there is a 29 3/4 foot channel, and the 26-foot channel is very wide. In Goat Island Reach the 26-foot channel is 310 feet wide. In Grand Bayou Reach the 26-foot channel is 400 feet wide.

THE CAPE COD SHIP CANAL appears to have taken a new departure with a new charter and new managers, with every indication of its being carried out to its full completion. The canal will be 1000 feet wide. The new company must reimburse the old corporation for all the work done and assume all its liabilities for work done. The work must be completed by the 1st of June, 1895.

A CARD made from aluminum, and which in appearance is as delicate as gold leaf, is rapidly gaining popularity among the general class of business men. It is said to be more durable than anything usually used in such cases, such as celluloid, wood, metal, paper, etc., and is said to be no more expensive.

Passing Events.

The Mechanics' Fair opened this week and will continue until Sept. 26th. The number of exhibits is said to exceed that of previous fairs.

The unseasonable and severe rainstorms in the southern part of this State indicate a change in the climatic conditions, brought about possibly by the new lake in the Salton basin of the Colorado desert. It looks now as if the lake, fed by the Colorado river, would be a permanent feature of the desert, in which case, the summer climate of the southern part of this State may be radically changed, with occasional showers and less heat in the interior.

There is nothing of special interest to note concerning the Pine Nut mines, Nev. One good claim is known, but the others are of doubtful value so far.

Rich mineral discoveries are announced at the head of Paradise Canyon, about 25 miles northeast of Ogden, Utah. The ore is very rich in lead, with some silver. The first claim, found by a sheepherder, was sold to the Bullion-Bank M. Co., for \$40,000. Some 300 locations have since been made and many prospectors are on the ground.

The First Cable Road.

It will be remembered that the Trustees of the Mechanics' Institute, at the time of the fair of last year, invited Mr. A. S. Hallidie of this city; the invention of the street cable system, to place on exhibition such models, or appliances as he might have relating to the original road, with a statement of its inception and construction; and also statistics of the application and growth of the cable railroad system. This request Mr. Hallidie complied with, and in the report of the Institute gave a sketch of the invention of the cable railway, describing in detail the original Clay street road, from the inception to completion.

From the small beginning on Clay street in San Francisco, the cable railway system has taken a position of eminence throughout the civilized world. Although the system had been working successfully on Clay street in full view of whoever desired to examine it, three years and a half elapsed before a second line was built. In this connection it may be stated that the first technical description, illustrated, of this first cable road, was published in the MINING AND SCIENTIFIC PRESS, and was prepared by the writer of this paragraph with the assistance of the inventor and engineer of the road.

Since then the construction of cable roads has gradually increased until there were 255 miles of double track in operation in the United States last year. According to the census, San Francisco, however, still retains the distinction of having more miles than any other city in the Union.

The system has been successfully introduced in Melbourne and Sidney, Australia; Dunedin, New Zealand; London, Birmingham and Edinburgh, Great Britain, and in Paris and Hong Kong. The San Francisco systems are rapidly being enlarged.

Mr. Hallidie has published in a little pamphlet his early experiences in designing and building the first cable railroad for the streets of a city, taken from the Mechanics' Institute Report above alluded to. It is of more than passing interest as showing the various steps in the inception and growth of a most useful invention.

Foundry Notes.

Engines for the Electric Railroad.

The Risdon Iron Works of this city have just completed two magnificent engines of 500-horse power each for the San Francisco & San Mateo Electric Railway Company. They have been set up in the shops, and when a representative of the MINING AND SCIENTIFIC PRESS saw them this week they were being taken down preparatory for shipment to the company's new power-house at Sunny Side.

The two engines are precisely alike, one being intended for a relief engine in case the other has to be put out of use temporarily, so there will be no danger of cessation of traffic. Each engine is a triple-expansion, with 15-inch high-pressure, 24-inch intermediate and 38-inch low-pressure cylinders, 48-inch stroke. The high-pressure and intermediate cylinders are fitted with the well-known Corliss valve gear and the low with ordinary slide-valve and Myer's out-off.

The hearings are all fitted with slight-feed lubricators, and the main crank-plans with centrifugal oilers. Each set of engines is provided with a fly-wheel 16 feet in diameter, 31-inch face, the weight of each being about 30,000 pounds. The faces of these wheels are made with grooves for 15 one-and-a-half-inch hemp ropes.

The condensing apparatus for each set consists of one jet condenser 30 inches in diameter and 50 inches high, and one compound Davidson independent air-pump. The steam cylinders are five and ten inches in diameter and 16-inch stroke; air, 14 and 16 inches.

The piping is arranged so that, in case of breakage, either side can be used, and can be run high or low pressure as the case may be. The high and intermediate cylinders are set tandem, and the low is set opposite the high-pressure cylinder.

These two large engines were completed in 46 days from the date of the signing of the contract. All the cylinders are covered with non-conducting material, and are lagged with black walnut. The engines are of first-class material and workmanship, and highly finished.

The Mechanics' Fair.

The Twenty-Sixth Industrial Exhibition of the Mechanics' Institute opened on Tuesday last, the opening exercises being conducted at the Grand Opera-house on that afternoon. These consisted of addresses and music.

David Kerr, president of the Mechanics' Institute, made a brief opening address, in which he referred to the growth of the institution since its organization in January, 1855. He said that at present the library contains 56,000 volumes, with a monthly withdrawal of 12,000 volumes by the 4500 members. In reference to the financial growth, he said the present block on which the pavilion stands was bought in December, 1880, for \$175,000, and all the funds available at that time above indebtedness was \$5000. "The wisdom of the purchase has been demonstrated," he said, "by the fact that recently the institute was offered \$1,000,000, showing a net gain in 11 years of \$825,000. The organization has never received but two gifts—one of \$10,000 from James Lick and one of \$500 from John Center, and its property is so protected by legislation that not \$1 of it can ever be used for private purposes. The Mechanics' Institute and all its interests are held as a trust for the people of the great city of San Francisco."

The oration was delivered by Thomas F. Barry. After referring to the work of the Mechanics' Institute as a factor in building up the mechanical arts in San Francisco, he said the exhibition this year was of more than usual moment, because of the great Columbian Exposition which would soon open at Chicago. "That great event," said he, "will mark an epoch in the history of our great country. It will show the progress of American genius after 400 years of civilization on this continent. All the nations of the earth are invited to bring their best trophies, and this exhibition, the opening of which we are to-day inaugurating, is an indication of what California will be able to show to the world two years hence."

"It needs no statistics to show the grand march of progress in San Francisco or in the State. On every hand the fruits of Pomona, the blossoms of Flora, the deliciously flavored wines, the great manufactories and the happy homes of an industrious, happy people, speak forth the stability of our beloved commonwealth. Each year the evidences of advancement can be seen, and not on the land alone, for on our bay float the highest triumphs of naval architecture. The record of the past and the experience of the present all tend to show that our inventive genius is still in its infancy."

At the pavilion everything is not yet in good working order, some of the exhibitors being, as usual, tardy. By Saturday, however, everything will be in place and the machinery all in motion.

The Arrastra.

The arrastra is one of the primitive appliances for crushing and amalgamating free-gold ores, but none of the modern machines excel it in closeness of work. Were it not for its slowness and comparatively limited capacity, many more would be used. As it is, the arrastra is the "poor man's mill," and there are many of them in use in the gold fields by miners who are working their own claims. They are generally run by horse or water power, and do good work.

On some large properties, arrastras are used for working over tailings which have passed through the ordinary mill, amalgamating and concentrating appliances. In such cases the arrastras are arranged in a row, and kept at work continuously, being cleaned up as occasion demands. The out on the front page of this number of the PRESS (for which we are indebted to the *Overland Monthly*) is one of a string of arrastras on the Yuba river, below a 60 stamp mill. It is 36 feet in diameter and run by water-power, a horizontal wheel being used as shown. Water is taken from the main flume, by branch boxes, and each arrastra has its separate wheel.

These machines are kept running on tailings and catch in gold and quicksilver about \$1.50 per ton. The stuff being already crushed and the machines being large, a large quantity of tailings can be put through. One man and a boy can attend to half a dozen or more arrastras. Large stones are used for drags, and the arrastra is also paved with irregular shaped stones, smooth on the surface. Where there is abundant water power, these machines can be effectively used on tailings, as in the instance cited.

Electric Transmission for Mine Work.

The Australians are quick to adapt new machines and systems in their mining work, and were among the first to utilize electricity for power in this connection. Several years before we had any quartz mills run by electricity in this country, they were running a mill in that way at Skipper's Creek, N. Z. They bought the Pelton wheels and Brush dynamos in this city and set them at work in 1885.

The Australians are about undertaking the largest general plan for using electricity in mining operations that has been conceived. A company is establishing a central plant to generate electricity, which will be sold for power purposes to all the mines requiring it in two mining districts. Both power and light will be furnished. The map on our first page, which we reproduce from the *Australian Mining Standard*, will show the general scope of the plan.

The two mining districts of Dandas and Zeehan, some miles apart, have each many mines and reduction works. At a point on the river between these districts, where water power is abundant, the Zeehan and Dandas Electric Power and Lighting Co., will establish a power plant which will equal 5000-horse power. By means of electric cables, this power will be distributed to the mines and mills in the two districts, for mills, hoists, pumps, etc. This will do away with the necessity of separate power plants for the several mines, and the company expects to sell the electric power for much less than the mines could produce it themselves. A railroad runs down from upper Dandas to the harbor on the coast, and it is possible this may be run by electricity.

There are many places in this country where a plan of this kind would work to the great benefit of the mining districts. A great deal of machinery could be dispensed with at the mines and mills and power could be obtained cheaply, where originally generated by water and transmitted by electricity.

The advantage of the plan is that any neighboring water power can be utilized, even when several miles from the mine or mill, or over a mountain central station for supplying power as is now common in cities. There is even better opportunity in the mining regions where water power is available for operating the dynamos, whereas in cities, steam engines must be the primal motors.

From the sketch-map given, it will be seen that the proposed Australian plan is quite a comprehensive one, taking in as it does, two large mining districts.

The Standard Drill Press.

The outgiven on page 113, shows an improved standard upright drill press, which is made from entirely new patterns and has all the latest and best improvements. The machine is heavily braced from the top to the base at the rear. This feature prevents the column from being forced backward during the strain of heavy drilling. All sliding drill-heads are fitted with the patented quick return, which is operated by the right hand alone, leaving the left hand of the operator free to retain its hold upon the work.

The sliding head is gibbed and balanced thus preventing it from falling when the bolts are loosened. The spindles are balanced to prevent back lash; are made of the best steel and extra as are also the cones and level gears, the latter being cut from the solid. By the improved clutch device the back gears are thrown in and out by a simple lever movement.

The table-arm is raised and lowered from the front, and can be adjusted by the operator without leaving his position. The 25-inch, 32-inch and 40-inch drills are fitted with the new patent automatic stop to the down feed. By this device, any number of holes may be bored to a depth, and it is particularly advantageous where an operator is running more than one machine.

A neat swinging bracket is furnished with each back-gear drill press, in which holes can be bored to hold drills, taper sockets, chucks, etc. An index-plate is also attached, showing speeds at which drills of different sizes should be run for drilling iron, steel or brass. The machines, entire, are very heavy and powerful, the metal being placed in the proper place to give most strength and power. The Parke & Lay Co., 21 and 23 Fremont St., this city, are agents for this machine.

Blast-Furnace Construction.

Continuing our extracts from Dr. Wedding's paper before the American Institute of Mining Engineers, we gave illustration last week of the German practice in blast-furnace construction, as shown in the furnaces at Friedenshütte. On this page, are drawings of the furnace at Horde, in Westphalia, showing the general proportions and arrangement. Dr. Wedding says Lurmann's cinder-notch is universally used. Generally the furnace is closed in front, as a crucible furnace. The old-fashioned fire-hearth occurs, however, when (in the production of Bessemer or Thomas pig) casts are to be made at brief intervals. But in this case, also, the cinder-notch is used, since the interspace of the fire-hearth is entirely closed by tamping. The cut shows this.

The removal from the furnace-walls of the weight of the tunnel-head, hell, etc., is becoming more rapid and more complete. The closed

at the Horde furnaces, does not, indeed, satisfy the theoretical principle that the gases should be collected only above or only below the stock level; but it has proved itself the best charging apparatus, probably because, by means of the

given shows such a construction, but some have gone still further and separated the parts of the furnace walls above the bosh, connecting each by means of a ring and brackets with the supports of the top platform.

with tar and glow-heated (gegluht). These are substituted for the ordinary fire bricks of the hearth, and seem to be well adapted even for the hosh and belly walls. They are likely to find increasing use wherever the blast furnace manager is not troubled with lead and zinc in the ores. The tuyeres are always cooled, but the form first introduced by Hülgenstock at Horde (see engraving) is frequently used instead of the ordinary closed form.

ANACONDA. — Mr. J. B. Haggin of the Anaconda mine, Montana, says that while the copper trade is lower than it has been, it is good enough to warrant the expense of a new and independent line of railroad from the mines to the works. The Montana Union R. R., raised the rates from the mines to the works, from 40 to 60 cents per ton, and Mr. Haggin

WATER-COOLED TUYERE AT THE HORDE WORKS.

LURMANN'S CONSTRUCTION OF BLAST-FURNACE BOSH AND HEARTH.

FORE-HEARTH, CINDER AND IRON-NOTCHES OF A BLAST-FURNACE AT HORDE.

PARRY CONE AND GAS-PIPE OF BLAST-FURNACE NO. 3, AT ESCHWEILER.

BLAST-FURNACE AT HORDE, WESTPHALIA.

top (for lump ores, usually the Parry cone, shown in the cut, from Lorraine; for fine ores, the Langen hell charger, frequently provided also with an interior suspended gas pipe contracting downward, as shown in cut) is always hung from the top platform and carried by special supports.

The closed top, with interior suspended pipe, suspended pipe, the center of the stock column is most effectively kept loose. At these furnaces the hell is operated by steam.

Lurmann was the first to emphasize the desirability of making the different parts of the blast furnace more independent of one another than formerly, and of relieving the lower parts from the weight of the upper. The figure

The cooling of the hearth is generally very complete from the hosh to the bottom. Yet it seems to have been rendered in part or wholly unnecessary by an arrangement which has been devised by Director Burgers at Gelsenkirchen, namely, the employment of carbon bricks made of retort graphite or of coke dust (containing one to two per cent of ash), molded

closed the mines in consequence. Now there is talk of building an independent road.

CHARLES R. STEIGER, of the firm of Stelger & Kerr, proprietors of the Occidental Foundry of this city, died on Sunday evening. He has been identified with the iron interests of this city since 1852.

Giant Powder Fuse Cap Fastener.

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are nearly gotten up of the finest cast steel, nickel plated. Price, 82 each, or the entire instrument finished in gold plate, \$1. N. W. MOODY, Fresno, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 20, 1891

During the week speculation has largely centered in wheat, and considerable money was made by the bulls. Dealings are increasing, which takes largely from legitimate pursuits. General trade is reported dull in all lines outside of farm products. Iron manufacturers, generally, report active business, with continued orders in hand. More iron is being used for building purposes. The money market is fairly easy, notwithstanding the heavy crops to move. The New York money market is reported as follows: Money is easy for short loans on good security, but distrust and uneasiness are the distinctive features, and this in face of many conditions promising unusual prosperity, such as bountiful harvests, cheap food and increasing railroad earnings, so that "there was never an occasion like the present." The effects are seen in the rigid scrutiny of all forms of security in making loans, and in consequence the best business firms are liable to embarrassment, transactions in commercial paper being confined to very narrow limits. Another consequence is seen in the accumulating reserves of many institutions.

MEXICAN DOLLARS—The market is quiet around 77 1/2 cents.

QUICKSILVER—Receipts aggregate 209 flasks. The market exhibits a healthier tone. The New Almaden Co. is not giving out quotations. This is accepted as a belief in better prices later on.

SILVER—The market has been sold down to 98 1/2 cts. To many the lowering market has proven a disappointment, for with the United States taking 4,500,000 ounces a month, it was only reasonable to conclude that the market would advance. The large wheat, corn, provision and cotton surplus in this country will cause exchange to rule low, admitting the importing of coin at a profit. Probably to this, to a certain extent, attributable the present forlorn by hears of silver to such low figures. If it is the work of the bears, it is possible they may find that they have over-discounted the future. In the local market, there is some inquiry for China and Japan, which is generally a forerunner of purchases by those two nations. The unsettled condition of both politics and money abroad may be having a temporary effect on the market.

BORAX—Overland shipments in last month aggregated nearly 8000 cts. In the local market, combination or pool prices quotations remain unchanged, but concessions are said to be obtainable from others.

LIME—Receipts the past week aggregated 3689 bbls. The market is essentially unchanged.

IRON—The market is about the same as reported last week. Spot supplies are lessening, but free shipments on the way are against the selling interest. The consumption in this State and up North shows a steady gain.

TIN—Nothing doing. Pig is easy, but plate is firmly held, notwithstanding the stock is large. At the East weak holders have been cleaning up. Welch makers are not pushing production.

LEAD—The market is quiet but steady. The East reports a strong market with free sales recorded, under confirmed advices of moderate.

COPPER—The market is well expressed by the following from Iron Age's report of the New York market: At the 12 cts, several hundred thousand pounds, according to current report, have changed hands; and it is claimed also that a moderate quantity was placed for future shipment at or about 12 1/2 cts, delivered. Between secrecy observed by principals and the rather peculiar plans adopted by some influential operators, actual market value is shrouded in mystery and the maneuvers would lead to the belief that special efforts are making to prevent a decline or to cause it to come slowly.

COKE—The market is steady at current quotations.

COAL—Imports the past week aggregate as follows in tons: Nanaimo, 3909; Seattle, 3910; Port Townsend, 1900; Coos Bay, 450; Departure Bay, 1388; Comox, 4000; Tacoma, 2850; Newcastle, N. S. W., 2632. Total, 23,089 tons. As will be noticed, coast coal is arriving more freely. The registered tonnage loading and on the way to this port from Australian ports is 57,631 tons from Newcastle, and 14,805 tons from Sydney; and to San Diego, it is 11,955 tons from Newcastle. Total, 84,391 tons register. From Europe and also from the East, considerable coal is on the way. It is said that for spot and near-by, the market shows more strength, but with no advance established.

San Francisco Metal and Coal Market.

ANNUAL MEETING.—THE REGULAR Annual Meeting of the Stockholders of the Inyo Marble Company will be held at the office of the Company, No. 137 Montgomery Street, San Francisco, California, on THURSDAY, the Tenth day of September, 1891, at the hour of one o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books close on Monday, September 7th, at 2 o'clock P. M. G. W. LUOE, Secretary. Office, G. W. Luoe, Secretary, No. 132 California Street, San Francisco, California.

FOR SALE.

THE MINERS' HOTEL, SIERRA CITY, Sierra County, Cal. This Hotel has the trade of the Miners. The general standing of the mines in this well known quartz-mining section makes this hotel a first-class investment. For further particulars, address J. ROSE, Sierra City, Cal.

C. H. EVANS & CO. (Successors to THOMSON & EVANS, 110 and 112 Beale Street, S. F. MACHINE WORKS, Steam Pumps, Steam Engines and all kinds of MACHINERY.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of "Book for Advertisers," 328 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every paper, and a good deal of information about rates & other matters pertaining to the business of advertising. Address ROWELL'S ADVERTISING BUREAU, 10 Spruce St., N. Y.

SITUATION WANTED By a man 42 years old, with 7 years experience in gold, silver and opal mining and surveying; graduate of the Mining Academy in Schenauitz, Hungary. References in Hungarian (Magyar) language. Content with moderate salary until he proves his ability. Address FREELAND, P. A., Lock Box 52, G. S.

DR. LA GRANGE, OCULIST, Office, 215 Powell St., San Francisco. Hours, from 11 until 2. Residence, 1432 Geary St., cor. Laguna. Hours from 3 until 5. All Diseases of the Eye successfully treated by his new system without the use of the knife.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

HOISTING ENGINES FOR MINES

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt . . . \$650 f. o. b.

Price "Triumph" Concentrators, with Plain Belt . . . \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

[Signed] Supt North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Long Distance Electric Power Transmission.

The accompanying engraving represents the dynamo made by the Electrical Engineering Co., of San Francisco, for the Black Diamond coal mines near Seattle, Wash.

This dynamo has a capacity of absorbing 120 mechanical horse power, and giving off to an electric circuit more than 90 per cent of that in electrical energy. It is of the constant-current type, with variable electro-motive force, and the armature is wound under the Keith patent of Nov. 30th, 1886. It is perfectly self-governing in preserving a constant or uniform current, and in varying the electro-motive force to suit the requirements for power at the motor, or motors, on the circuit.

At the Black Diamond mine, it supplies electric energy to an 80-horse power electric hoist, located at the head of a slope, 3100 feet from the mouth of the mine. By this method, a train of cars carrying 12,000 pounds of coal can be hoisted up the slope, which is 450 feet long, with a grade of 1 to 3, in one minute. The stoppage movements of one lever controls the hoist in all its movements, and much more readily than is the case with a steam or compressed air hoist.

But three-horse power is lost in conveying the necessary power to the hoist. This waste is very much less than by any other known means. We will in the near future illustrate the hoist referred to.

Children in Mines.

It is noteworthy that the investigations of the Census show that there are employed in the gold and silver mines of the United States only 82 boys under 16 years of age. No women or girls at all were found to be working in these mines. This is a very different state of affairs from what obtains in European countries, where many women and children work in the mines; and in the Eastern coal, copper and iron mines, boys are employed in light work. Abroad, legislative restriction has had a good effect, but it has not been necessary in the

western part of this country. The "pit-brow lassies" of England and Wales number about 6000. They are the girls and women who are employed about the "brows" or months of British iron and coal mines. Female labor underground is prohibited, and there are restrictions also on juvenile labor. The gold and silver mines of the country have thus far been free from the necessity of employment of children, or of convicts and contract foreign importations. The Italians, Hungarians and Poles, who swarm in such numbers about certain mining regions in the East, seem to breed trouble wherever they are. They work very cheap and crowd out the native-born mining communities. Such Italians as are in our coast mines work for the same wages as others, and are individually independent, not coming on the contract system in vogue in the East.

THE Tarentine has beaten the Ma-jestic's wonderful record across the Atlantic by one hour and 37 minutes. She made the best 24-hour run on record, 517 knots, and also the best three days' run. She traveled at the rate of a sea-mile in 2.95 minutes, and at the rate of 20.104 knots an hour. The vessel made 1532 knots in three days, the fastest time ever made. This beats ordinary railroading.

JOHN DOUET was killed last Sunday at the Utica mine.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Mines of El Dorado County.

(From Our Traveling Correspondent.)

EDITORS PRESS:—Leaving Plymouth, you can tell by the change in the roads when you cross the county line into El Dorado, as you can in passing over to Calaveras. If there is one thing more than another that Amador is celebrated for, it is her rough roads in summer and tough roads in winter. Below Nashville, the Los Padres shaft has been cleaned out and drifts are now being run east and west on the vein. The mill will be started up when sufficient ore has been accumulated. So far only the footwall side of the vein has been worked. No crosscut has been driven to the hanging wall, but it has every appearance of being 50 feet distant—judging from crosscuts on the croppings. The ore from the surface drift, to a depth of 50 feet, milled over \$14, after the richest of the ore had been selected and worked in an arrastra. The vein is evidently very large, and in depth the ore from the shoot should grow in value. The exact length of the shoot is not known, but good prospects can be got from the croppings for a distance of several hundred feet.

The McNulty has closed down.

The Ohnroh is keeping up its reputation, if not exceeding it, by very rich ore in the 700-foot level. If the proceeds of the ore from this mine could all be invested for one year, in developing it, the property could then produce dividends double those now turned out from the seven-foot vein of average \$18 ore. The Church is, without doubt, the best mine in the county to-day.

At Placerville,

The Rodgers, Cedar Ravine and Landecker drift gravel mines are all running regularly, and said to be doing well. The Gentle Annie is dropping her stamps with accustomed regularity and has just contracted for 200 feet more in depth by shaft. The Pacific is running its 20-stamp mill from ore out of the 1000-foot level, in the Pacific proper, to test the value of the vein, which is here 21 feet wide. The company is also sinking and drifting on the Epley and making an upraise. The vein is showing good ore. On the Harmon the company is taking out the water and getting ready to operate the mine.

The company is also driving a tunnel on the Van Hooker, which is now in 900 feet, with 100 feet to go to the vein 600 feet deep. With the general starting up of the Pacific Company's mines, the future looks brighter for Placerville.

Slate Quarries.

Down at Chili Bar, the Chili Bar slate mine is running along with its accustomed regularity and vainly trying to keep up with its orders. The California Slate Co. have about adjusted their difficulties and can resume at any time. Over at Kelsey, Mr. Strable is taking more interest in his own broken anatomy than he is in slate. The slip of a neck-yoke put him under a wagon-load of slate that broke several ribs and otherwise crippled him for the present. The slate, however, is going forward just the same. The "Chili Bar," "California" and "Strable quarries" are said to be all held under bond by parties who contemplate the purchase and consolidation of the three properties. On my last visit I called attention to the advantages here offered for the investment of capital in an established business yielding a large profit, but badly handicapped for want of working capital. These slate quarries are inexhaustible, the demand constant and ever-increasing, while the freight from the East leaves a good margin of profit in itself. I would repeat the opinion I stated before, viz.: "The slate mines of El Dorado will in time exceed in value all the quartz mines of the county."

At Kelsey,

The Dalmatia is running smoothly with its electric power, and the superintendent, Mr. J. Cullen Pierson, will soon convey the same power and operate their recent purchase—the St. Lawrence—by electricity under the Keith system, transmitting the power by wire for a distance of over five miles.

The Ida Livingston, which is situated near Kelsey, is now being developed. The shaft is down 100 feet, and drifts will be run to the top of the shoot, which is known to be of a good grade of ore. Mr. J. T. Kelley is in charge of the mine.

Over at Garden Valley the Taylor is running right along despite all the reports to the contrary. The 20-stamp mill is a good one, and will be kept busy on the 6 to 30 feet of vein matter. The shaft is now down 500 feet. The Ivanhoe, Lone Jack, Esperanza and Rosencranz are idle. Some of these mines would undoubtedly prove good properties if the vein was sought where it is, but there is a class of miners who will have a vein where they want it or not at all, and this section has had more than its share of that kind of mining with the mines closing down in consequence.

At Georgetown,

The Van is tied up in litigation and is idle in consequence. The quartz mines of the county have been more prosperous in the past, but it looks as though there was a brighter future.

One thing is certain—the county contains a vast amount of practically unexplored country and a large number of promising prospects that look worth developing. E. H. SCHAEFFLE.

Ophir, Placer County.

(From Our Traveling Correspondent.)

EDITORS PRESS:—Ophir is quiet at present. The Hathaway, Geo. Taylor superintendent, is sinking its shaft. It is now down 400 feet, the vein averaging 30 inches of \$8.50 ore. The beauty of this mine is in the fact that \$8.50 is the average of all the vein matter throughout the entire length of all the drifts. The mill will start up as soon as water can be secured, which will be before the end of August.

The Mina Rica.

J. W. McCullough is superintendent of this mine, which is located about 1½ miles southeast of Ophir. The vein is opened by shaft, which is down 150 feet, with drift of 387 feet, and by drift from surface 500 feet long. The pay is continuous; vein averages 22 inches, with values ranging from \$5 to \$200 a ton. The mine has now a ten-stamp mill in operation.

The Moore Mine.

This property is immediately below the Mina Rica. The shaft is now down 200 feet on the 11-inch vein. No drifts have been run, but from the vein, \$70 to \$80 ore has been extracted. Over \$30,000 have been extracted in the past two years. The mine is now equipped with a good hoist, and promises to be heard from in the near future.

At the Three Stars mine, Mr. Hanley is engaged in putting down a three-compartment shaft, and is now down 50 feet on a three-foot vein of very good ore. The Gold Blossom and Eclipse are idle. The mines of Ophir are mostly in granite. Some of the mines of this district have produced exceedingly rich ore. Those now working are on lower-grade ore, but it occurs in shoots of sufficient length to make the mines paying propositions.

E. H. SCHAEFFLE.

Feather River Gold.

The River Turned from Its Natural Bed.

"No one allowed on these works without a permit."

That is the kind of greeting I found on the gate that gives entrance to the great Golden Feather mine above Oroville, writes a correspondent of the Marysville Appeal. They enforce this, too. There are too many shining sands laid bare to allow indiscriminate visits from the prying populace. Then the partially smothered rumors of the discovery of rich snken ledges by workmen engaged in the preparatory work, no doubt, causes a desire on the part of the many curiously inclined to go and see for themselves.

The old-time miners took out a vast quantity of golden treasure in early days from a claim very near the Golden Feather, and now that a claim, probably richer than the Old Cape of '49, is about to be laid bare, an intense desire on the part of the public to go down into the dried-up river-bed and scoop up handfuls of golden flakes has caused the posting of that chilly greeting on the outer portals.

My credentials permitted me to inspect the immense rock and cement wall which separates the artificial bed, through which the river now runs, from the old bed, now fast drying up. Only a long series of pools of water, and hars of sand and gravel, are to be seen where once ran the floods of Feather river. These pools are to be pumped out and the entire dried bed, 10,000 feet in length, carefully and scientifically relieved of the vast treasure that has long been supposed to lie here guarded by the racing waters.

I found Major McLaughlin, the general manager and promoter of the company, at camp, one of the villages at Golden Feather. He was on a tour of inspection, having driven up from his Oroville office with his secretary, Mr. Giesse.

Major McLaughlin pronounces his work—the turning of the Feather river from its bed for a distance of more than two miles—"the most stupendous piece of mining engineering ever executed."

In reply to my inquiries, he said that they were a month ahead with their work, and that notwithstanding that everything had been done in the most substantial manner, the river has been turned a month earlier than ever before known in the history of river-mining. The work of rigging the pumps is now being proceeded with, and in a short time the active work of cleaning up the pay channels will be commenced.

The Major refused to talk about the probable amount of gold that he expected to obtain, but that the amount is enormous may be judged from the wonderful piece of work that he has just completed.

There are two separate and distinct English companies engaged in the work—the Golden Gate Company and the Golden Feather Company. One is capitalized at \$250,000 and the other at \$1,000,000, and the claims adjoin each other.—*Sacramento Record-Union*.

A FURNACE will soon be put up at the Chinuar King quicksilver mine, Sonoma county. Some very rich ore has lately been found.

Country Roads and City Streets.

NUMBER 2—CONCLUDED.

[An essay by MRS. MARY L. HOFFMAN, read at the meeting of the Women's Press Association in S. F., July 13, 1891, and furnished for publication in the Press.]

Poor Macadam.

We think it entirely safe to say that poorer excuses for roads than those, in this country, called by courtesy macadamized roads, could nowhere else be found. The hard-headed Scotchman who introduced the road into England would indeed be shocked by a view of this bungling counterfeit. We trust he is unable to see it.

To the credit of our present Board of Supervisors, he it said, they have now made meta and honde beyond which those "wicked ways" of mud and dust can never again come.

In Baden, one of the smaller States of Germany, we find the heat of macadamized roads. There they use a hard basaltic rock, for which they pay \$1.78 a cubic yard, and find it good economy. Their experience proves that the harder and tougher the rock the better the road, and the better the road the less tractive force required.

In the macadamized roads of Paris, it is the rule to roll the road with from 12 to 20-ton rollers until a piece of the hardest rock procurable is crushed without being pressed into the surface of the road. Such macadamized roads as are found in Baden and in Paris a majority of the people in this country have never yet seen. Welcome the day when in our outlying districts we shall see, if macadamized roads we see at all, just such roads as Baden and Paris have shown to be not only possible, but of macadamized roads the most economical.

We must bear in mind, however, that even the best macadamized road has these defects—more of less mud in winter and dust in summer, great resistance to traffic and great cost of maintenance, requiring, during summer and fall, according to the best authorities and close observers, to be watered three or four times a day.

Objections to Stone Block Pavements.

Of stone block pavement, with the noise and continual din incident to travel upon it—concerning its effects upon delicate women, upon children and upon invalids—what shall we say?

To the women, nervous diseases, to the children of ten years hysterics, and to invalids, certain death. These are some of the concomitants of a block stone pavement, with its incessant clatter.

Gen. Q. A. Gilmore, C. E., a noted authority upon the subject, says:

The joints of a block stone pavement constitute, after enlargement by wear, fully one third of its area, and under average care, the surface of fifth exposed to evaporation, covers fully three-fourths of the entire street. This foul organic matter, composed largely of the urine and excrement of animals, is retained in the joints, runs and gutters, where it undergoes putrefaction in warm, damp weather, and becomes a prolific source of disease. During a moderate rainfall it is as foul as any sewage.

During dry weather the street soil, of which a large proportion is horse manure, becomes dust and floats about, injuring the eyes and poisoning the respiratory organs.

We employ servants and we instruct them to be vigilant to detect, and persevering with brush, broom and chamole, to eradicate the very dust we have invited.

Prof. Ely of the Johns Hopkins University advises that we use our energy to enlighten the public authorities and to co-operate with them and that we set about "stimulating the municipal conscience."

Work of the Wheelmen.

If it be true that one extreme follows another, then surely are we about to enter upon a grand era of road-building and of street improvement. As valuable coadjutors, 15,000 wheelmen have suddenly appeared, and books little and big upon the subject have they scattered broadcast over the land. Some of these books it has been our pleasure to read, and to Geo. P. Wetmore, Esq., one of the officers of the Bay City Wheelmen, we desire here to return thanks for a very interesting work, issued by the Kansas Wheelmen.

To a croaker who has said, "Oh, these wheelmen are all young," I would reply: "This defect, if defect it be, they are rapidly overcoming, and soon with added years and added numbers, with increased their efforts will be crowned."

That the civilization of a country is determined by the condition of its roads, we partly believe, but we also believe that from a long slumber upon the subject of thoroughfare, the people of this country are as one man awakening. And if sleep with us has proved "a generous thief," restoring to vigor what she has taken from time, we may well look now upon every hand for vigorous work.

Efforts of the Press.

The RURAL PRESS, awake to every public improvement, realizes the importance of this movement for good thoroughfare and "in season and out of season, advises permanent roads, impervious, and clean."

The Morning Call, systematically opposes all dishonest street work.

The Daily Examiner has well suggested that the substantial and honest improvement of our highways be made a political factor.

The Daily Chronicle in an exhaustive article

has directed attention to our need of legislation upon the subject of truck-building and of the weight each truck should by law, be allowed to carry. Leading civil engineers agree that one ton to each wheel, or four tons to a four-wheeled truck is a sufficient weight. If a law limiting the weight carried, and prescribing the width of tire should obtain,—a set of spring trucks like those in New York city would soon replace the savage trucks now in use on this coast, and the best of streets comparatively noiseless, would be possible—streets that even in the business quarter, people could "see and live."

The Daily Report has sought in many ways to improve our thoroughfares. In regard to the newspapers mentioned, we speak of our own knowledge. It is quite likely that other newspapers are doing equally good work; and so, in demanding permanent and cleanly roads and streets the press is united and our work is auspiciously begun.

Washington, D. C., has long since answered the question "What pavement shall we have for our residence districts and of bituminous pavement she has over a million yards, clean and noiseless.

The example set by the city of Washington, Buffalo was the first to follow, and now 34 cities of the United States have a total area of five million square yards of bituminized pavement—more than twice as much as all Europe combined.

Smother than stone, more durable than macadam, and more cleanly than either, we have, to-day nothing that excels it.

During the past year Cincinnati has spent millions of dollars in bituminous pavements, and property on Race St. so paved in that city has advanced 33½ per cent; and the same is true of property on every well paved street in every city.

Philadelphia and Baltimore still have cobble-stone pavements; and when we contemplate the incessant din in which most of a business man's day is spent, small wonder is it to us that he suffers intensely from nervous diseases, especially in those cities where many ringing pavements obtain.

Cost and How Provided.

In St. Joseph, Missouri, the cost of a bituminized pavement is \$2.63 a square yard. In Topeka, Kansas, \$3, including the grading of 9 inches of the street. In Omaha \$2.98 with a money guarantee to keep it in order five years.

The Morning Telegraph of New London, Conn., has made a tabulated summary of pavement data from about 30 American cities from answers given to questions sent out by the paper.

In eight cities the whole cost is borne by the abutting property. In three cities, viz., New Haven, Conn., Oswego, New York, and Utica, New York, the cost is divided between the abutting property and the city at large.

In 21 of these cities heard from, the cost of paving is paid from the general tax.

From none of the Massachusetts cities sending replies, is there any assessment on abutting property.

In the six Connecticut cities, five put the whole cost upon the city at large, while one puts the cost upon both city and abutters.

We would suggest a federation or Congress composed of delegates from each city, to discuss the vexed question, "How shall street expenses be met?"

Bituminous Rock Pavements.

Mr. Stevens, Secretary of the San Francisco Free Library, a cultured and traveled man, has said: "You know the streets of Washington are not paved with the same bituminous rock we use in San Francisco. Ours is much better than theirs." This he said with an earnestness born of conviction, and he had many times passed over the pavements of both cities.

The wear of bitumen has been found to be quite small, diminished thickness under traffic being principally due to compression and not to abrasion.

It has been ascertained in London that some streets paved with bitumen, and subject to four years' wear of the heaviest traffic, the bitumen had diminished one-ninth in thickness, while in specific gravity it had increased in about the same ratio.

Some of the same street dressing, after 15 years' wear in the Rue de Bayere, Paris, was found to have lost 12 per cent of its thickness, but only 5 per cent of its total weight. The average life of bituminous pavement, as laid in Washington and Paris, is 17 years.

Less sonorous than granite or basalt, bitumen as a pavement dressing is comparatively noiseless, and when properly laid upon a good concrete foundation of sufficient thickness, heavily loaded vehicles, unless the day be very warm, make no impression. It is related as a fact (and as far as we are aware the statement has been discredited by no one) that over a piece of bituminous pavement at the corner of Fifth avenue and 24th street, New York, a heavily loaded four-wheeled truck weighing 3 tons, carrying a boiler weighing 21 tons, passed without leaving a mark.

Unless stone blocks be of excellent quality, bituminous rock takes the first place as to durability and stone-block pavement the second.

General Gilmore thus conclusively sums up the advantages of bituminized streets:

1st. They produce no dust and therefore no mud.

2d. They are comparatively noiseless.

3d. They do not absorb and retain noxious liquids, but facilitate their prompt discharge into side gutters and sewers.

4th. They are impermeable and emit no noxious vapors themselves nor allow their emission from the subsoil.

5th. They reduce the force of traction and consequently the expense of wear and tear of animals and vehicles.

6th. Although they do not furnish so strong a foothold for animals with a heavy load as stone blocks in narrow courses, still they do not become polished and slippery from continual use.

For pleasure driving, for cycling and for all street purposes, its cleanliness, its noiselessness and its imperviousness to deleterious odors, commend the bituminized street.

Its velvety texture, and the mellow tone of its color, make it pleasing to the eye, and we trust it may be "a joy forever."

The City of Washington, our national capitol, has the best paved streets in the world and the widest. She has 25 avenues and 22 streets, each over 100 feet in width, and 11 of her avenues are 160 feet in width. It would be well for each of us to inquire how many streets and avenues in his or her own city measure 100 feet in width; how many 130 feet; and how many 160 feet. The answer would doubtless surprise the residents of more than one city.

That the mortality from phthisis and other diseases be lower in wide than in narrow streets, medical authorities agree; and so the desirability of wide streets is not a debatable subject.

Commonwealth avenue, Boston, said to be the handsomest residence street in the world, is 400 feet in width, and between the drives, lawn and shrub and tree and statue are making of the passer-by and of the on-looker people of outline.

Oh, for a Shepherd! even though he were as levin as "Boss Shepherd" of Washington. A quarter of a century of utility and beauty have followed his croak in that well-paved city.

Boards of Public Works, removed from political influence, National and State legislation, with municipal co-operation, and the moral support of a majority of the citizens upheld and buttressed by a proper pride, would soon stamp with merited repute any household willing to subject his or her family to the health-destroying, comfort-subverting annoyances incident to any but a noiseless, impervious pavement.

In the city of Buffalo, we find 100 miles of bituminized streets, and the authorities tell us that only about \$100 has it cost in the last six years to keep these bituminized pavements in repair.

In San Francisco, one-seventh of all "accepted streets" are bituminized. Over them to ride is a treat, and upon them to reel is a joy.

In view of this, shall we still construct a miserable street that is a poor imitation of a real macadamized road? Heaven forbid.

Oakland Streets.

In the city of Oakland, upon grove and other streets, we find beneath the gutter upon each side of the street a sewer, laid close to the curb and parallel to it, so that by side sewers and service pipes the street will never be disturbed.

As Oakland has, in this respect, improved upon San Francisco, so let us improve upon Oakland; and let us, under Market street at least, have a sub-way as London and Paris have under their streets. If necessary, issue bonds for its construction. Through this tunnel, let sewer-pipes, gas-pipes, water-pipes and all pass, and let each pay its quota. When at an early day the Market street sub-way shall have demonstrated itself as a first-class business proposition, Montgomery street, Kearny street, Van Ness avenue and Point Lobos avenue will clamor for early consideration in the same line, and the vision of our city in all her youthful vigor a leader, with older and less progressive cities following, will have materialized.

Oakland has bituminized Telegraph avenue to half its width from Broadway to 33d street, a distance of over three miles, and opened it to travel while she paves the other half.

Oakland allows no wooden sidewalks to be built anywhere within the city limits; and the glare of all artificial stone walks must be toned down by a specified amount of color. Here then are examples from Oakland worthy of imitation.

But while Oakland with a tax of \$2.05 upon \$100, lays down hitmen upon a foundation of macadam, reminding us of a man who should build his house upon a lot of three-legged stools placed side by side, we must in passing, administer to her a little friendly criticism.

Concrete Roadways.

Good concrete, once laid, lasts practically forever, and over it any style of hitmen or other top dressing can be laid; as over a dining table we lay a piece of cotton flannel to deaden sound.

In British India where are to be seen some of the best roads in the world, we find many concrete roads pure and simple. But, of course, the concrete for a road must be made of a hard tough rock, preferably basaltic and in correct and exact proportions, it must be mingled with best cement and best sand. For the basaltic rock with which the concrete for the roads in Bridgeport, Conn., is made, they pay \$1.50 a ton of 22 cu. feet or \$1.84 a cu. yard. The resulting roads are found to be useful, beautiful and economical.

If in spite of protests made by the nerves of men, women and children, whose lives are spent amidst its din, stone pavement be still demanded in a business street, let it be such a stone pavement as we find in Providence, Rhode Island upon Westminster and other streets,

That is a block pavement, laid on a hydraulic cement concrete foundation, six inches in depth.

The blocks which are uniform in size and regularly shaped, are set in exactly parallel rows across the street and hedged in the concrete. The spaces between the stones are also filled with concrete made of the finest cement and sand, and the hardest, toughest rock. In such a pavement, clean and smooth, it would be possible that many a citizen would take a personal pride.

It must be borne in mind that this pavement was laid in Providence by a Board of Public Works not under political control, and under the immediate supervision of a competent civil engineer.

Col. Albert Pope of Boston, who has, himself, come to be an expert upon road and street improvement agrees, not alone with civil engineers, but also with medical authorities that—

"A properly built highway must be built with a solid, firm foundation effectually separating the surface from the soil below."

"When public opinion becomes more enlightened, and property and vehicle owners gain a due appreciation of the great economy of horse flesh and vehicles by the use of bituminized pavements instead of rough and rigid stone."

Our city will rival Washington in her charming drives, and our genuine macadamized roads, properly constructed of the hardest basaltic rock, will be relegated to the country districts, and riding, driving and cycling will be restful.

The highest authorities and the closest observers tell us that a macadamized road must be made of a basaltic rock, not of red rock nor of a flint-like rock.

Major R. Malcolm, C. E., late of Bombay, where we see the most perfect system of road-making in the world, says in regard to the durability and economy of the concrete roads, as compared with macadam, that "If we estimate the cost of building and maintaining each for a term of ten years, the actual cost of the concrete road for the term of ten (10) years is 50 per cent less than that of the macadamized road for the same time. He refers also to the comparative ease with which loads are hauled over the concrete road. Upon a properly built concrete road, the same animal can draw more than twice as heavy a load, and as its average cost is half as much, it would be at least four times as advantageous, in addition to being ten times as clean as a macadamized road.

Good Roads Are an Investment.

And not a tax. By the increase in property values, they are paid for many times over.

In Philadelphia, a committee of citizens alive to the importance of this subject, in 1889 offered through the University of Pennsylvania cash prizes of \$400, \$300 and \$100 for the best essays upon road-making and maintenance and road laws. The first prize was won by Henry Irwin, B. A., C. E., Canadian Pacific railway, and in his paper he gives a capital rule by which all desiring to make the best of solid concrete may make it.

Recipe for Concrete.

As such proportions appear to be a dead secret to so many "concrete" makers in this and other cities, we cheerfully give them here-with:

Into every box of sand, pour enough cement of best quality to fill the voids left by the sand. To this add ten per cent more cement. Into the same box, filled with broken rock pour sand enough to fill the voids of the rock, and to this add ten per cent besides.

If this rule be followed, he says, strong, compact concrete will result. But if less cement or less sand be used, the result cannot be depended upon.

That education in road-making is much needed in this country admits of no question. In a paper read recently by Mr. George E. Crane before the Minneapolis Society of Civil Engineers on "Permanent Improvements in Highways," he says that \$300,000 is practically thrown away by the method of road-making now in vogue in the State of Minnesota.

With good streets, a demand comes for light, elegant and graceful vehicles, and thus our aesthetic ride is cultivated.

The Mayor of Philadelphia, by a wise selection of General Wagner as Director of Public Works, has given the taxpayers greatly improved streets and at the same time saved them \$1,000,000 a year.

When we remember that New York, through all her bossism and Tweedism, has come to be at least as well governed a city as Boston, we are reminded of a glimpse given us in the Apocalypse of a radiant throng, introduced as they who had come "through great tribulation," and for our city, standing as she does in some respects upon a higher plane with each governing body, we see a radiant future.

Road Regulations.

To our present Board of Supervisors and to our Mayor, of whom we are justly proud, we would here refer. That they are conducting the business of this city upon business principles, as far as dollar-limit pledges and political shackles will allow, we believe; but we elect officials to guard our interests and to legislate for us, and when by the greatest diligence they could have become only half acquainted with the necessities of the situation, we proceed to elect to fill their places other men, who, upon the subject, have no knowledge at all. Besides, with pledges we bind them hand and foot and hid them make bricks without straw.

God-speed every municipal and State and national officer in all honest efforts toward

making our thoroughfares clean, durable and beautiful—such as shell he fitted not for the highway of kings, but for the upward march of a sovereign people.

While we dilate upon the effects of first-class roads and streets, upon property values and business generally, we should remember that upon the best of streets depend the health and comfort of all our people. Each has, at longest, "so little while to stay," that all our highways and byways should at once be put in complete order for his especial benefit.

That good roads must be smooth upon the surface, practically unyielding and impervious to water, all are now agreed, and also that poor roads and poor pavements mean wasted money.

In New York a law is in force requiring all two-horse farm wagons, and all others that carry over one ton, to have tires four inches in width and to have the hind wheels eight inches farther apart than the forward ones, and that all carriages shall have their hind wheels the width of their tires farther apart than their forward ones.

With this law in force, it is claimed that the cost of road-making is reduced 50 per cent. Wagons thus made do not track; they make no ruts and they are more easily drawn.

In Paris the authorities do not allow wheel-harrow loads of concrete to be emptied directly upon the soil, but they do require the concrete foundation, as elsewhere, six inches in thickness, to extend under the curb and four inches behind its rear face.

The city of Toronto having spent \$10,000,000 acquiring experience in the building of macadamized roads, unqualifiedly condemns them and hemoans the fact that to get rid of these roads and to possess her self once more of a dirt road, easily managed, will cost her many thousand dollars more.

Cincinnati reports that the chief thing permanent about the macadamized streets and roads of that city has been the permanent expenditure for repairs.

In view of such experiences, the Common Council of Topeka, Kansas, has preferred the dirt road to the so-called macadam road.

The first-class railway accommodations demanded in America and the extremely low-class "driving roads" would appear to be a misfit.

Every country road should be an Alameda—a shaded walk—for animals and men. With our country roads smooth and clean, and bordered with trees, it would be the ambition of householders and others to own beautiful horses and light, graceful vehicles, and of every wheelman near to glide past all on his high-grade cushion tired wheel, and riding, driving and cycling would be restful.

A number of enlightened and progressive men and women are urging that the science of road-making have its place in the course of applied mathematics in the different universities of this country. "Road and Street Improvement" is a subject in which every man, woman and child have either directly or incidentally an abiding interest, and North, South, East and West it is now attracting attention. Our commercial and agricultural interests require the best of shaded roads.

California, for her fruit interests alone, could well afford to build and maintain such roads, that her fruit which now reaches the market towns bruised and dust-covered might arrive in appetizing condition. The city people then would get, at least a part of the time, good fruit, and the fruit-raisers would get good prices.

A few bright leaders are already in the work we so enthusiastically urge. May their following be so ready and so earnest as to insure great progress in this work before the close of 1891. "Now is the accepted time."

If we have succeeded this evening in inducing so much as one person to work intelligently and successfully for the improvement of thoroughfares in his or her city or county or district, our reward will have been ample.

HITE'S COVE.—The Marlboro Gazette says:

Hite's Cove, only a few years ago, one of the most prosperous mining camps in this portion of the State, has fallen into a state of innocuous desuetude pitiful to think about. Where formerly hundreds of busy, active men, and many merry families held sway, and the thud of a hundred stamps made ringing music as they crushed out the glittering gold, now, one solitary figure is seen stalking about in solemn silence among the deserted houses and crumbling mills. Yes, for all the vigorous life which eight or ten years ago animated Hite's Cove, no one is left to tell the tale of former greatness, but Fred Gardner. He is at once king and people, and with no one to contradict or molest, he should be happy, but, no doubt, he would be so glad to see a human face, that he would enjoy even a lively quarrel with a knock-down.

REPORTS reached Tucson, Ariz., recently that the Mexicans have discovered a nest of nuggets in the low hills between the lower dam on the Hassayampa and Weaver rivers. They were from the size of shot up to \$20, and aggregated \$483.

SULPHATE of copper is in more demand in England, and sales for immediate delivery have been lately made at £15 7s 6d per ton. For delivery next year, £17 is asked by makers.

ANTIMONY is selling at £44 to £45 per ton in Liverpool.

THE Eureka Consolidated mine has \$50,000 worth of lead ready for shipment.

Nothing is ever done beautifully which is done in rivalry, nor nobly, which is done in pride.—Ruskin.

THERE are only four quartz mines being worked to any extent in Alaska, but these are all paying very well.

FLATS.—The present system of building in flats, which has become so popular of late, was practiced in ancient Tyre.

W. L. LONG, of Portland, Or., is the latest discoverer of the famous "Lost Cabin" mine on the Klamath reservation.

LEADVILLE, COLO., has a new thick vein of high-grade silver ore, found by boring with diamond drills at the Bohn shaft.

A NEW HAMPSHIRE housewife has found a new way to shell beans and peas. She runs them through the family clothes wringer.

THE AMERICAN ASSOCIATION for the Advancement of Science commenced its 40th annual session at Washington, D. C., on Monday, the 17th instant.

THE six leading Lake copper mines produced 22,438 tons of fine copper in the first six months of this year, as against 21,400 tons of copper in the same period in 1890.

RICHER ore than has been found since honanza days, has been struck in the Poorman mine, Silver City, Idaho. Those old mines do not appear to have been worked out after all.

ALUMINUM FOR ACTINIC LIGHT.—Herr Pulz informs the Vienna Photographic Society that he uses aluminum as a substitute for magnesium to produce an intense actinic light such as photographers require.

A MIXTURE of sweet oil and enough kerosene to scent it, lightly brushed into a horse's coat, will repel flies and small vermin and keep the coat bright and smooth and clean. Use a rather stiff brush and add a little elbow-grease.

AMOS HOWARD FISKE of South Framingham has been appointed Chief Engineer of the Leland Stanford Jr. University. Mr. Fiske is an engineer of large experience and especially well acquainted with the various systems of electric lighting.

ELECTRIC ELEVATORS, operated by electric motors are growing in public favor for use in private. They are designed to carry three passengers, and the apparatus by which they are operated is described as being very simple and compact.

ALASKA COAL.—A party of miners, with supplies, left on the steamer Jennie last week, for the coal claims of the Alaska Coal Co., Kachekmak hay, Cook's Inlet, Alaska. The coal is said to be of excellent quality. The men are going to thoroughly open up the new mines.

A CABLE TO BRAZIL.—Robert G. Ingersoll is reported as having said that he recently had a conference with President Harrison in regard to the proposed establishment of a cable between the United States and Brazil, for the promotion of which Colonel Ingersoll is acting as attorney.

THE De Lamar mine, Idaho, is working ore which assays \$33.98 per ton, of which \$17.55 is in gold and \$16.43 in silver. They have 86.10 per cent of the gold and 85.94 per cent of the silver. In June the mill turned out \$17,294 gold and \$19,042,27 silver. The gold is signed at \$20 per ounce and the silver at \$1 per ounce. The profits on the mine for June were \$27,036.

FORGING BY ROLLING is a method coming rapidly into use. In one of the rolling-machine manufacturing in Fitchburg, Mass., there is a process in successful operation for forging articles by rolling, the rolling work being done between flat bars working vertically, and having the form out into or raised upon the face. According to a published description of this establishment and of the method in question, an extensive business is done in making track bolts by this means, the head and threads being rolled hot, and, in especial, the process of rolling threads has been worked out to a great nicety, the product being as clean and accurate, and, it is alleged, the thread is much stronger than if it were cut.

THE MARBLE QUARRY.—The contract for the delivery of 250 tons of marble for the Stanford University has been completed. Besides this, about 100 tons have been forwarded to the company's yards in San Francisco. Another contract for 300 tons is in process of negotiation, with every probability of the company securing it. At the quarry, shipments have been at a standstill since the collapse of the derrick. Mr. Gillette, president of the company, came up Monday evening. He says the derrick can be made to do, with a thorough repairing, as the blocks will not be unusually large. W. H. Prouty has been awarded the contract for hauling all the marble shipped to the lone depot at \$5.50 per ton.—Amador Ledger.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BAY STATE.—*Ledger*, Aug. 22: The sinking operations have reached 80 feet, which is the depth of the old shaft sunk many years ago. It is intended to go several hundred feet—perhaps 500—before prospecting the ledge is inaugurated. The water, which nearer the surface was very troublesome, is now under easy control, and sinking will progress rapidly. The company paid out over \$1200 last month. All the employees are stockholders in the company, and have unshaken confidence in the outcome.

THE CLINTON CON.—Messrs. D. Guttman, C. Wieland and S. M. Shortridge, the attorney, came up from San Francisco on Sunday evening, concerning the suit instituted by George Newman against the Clinton Consolidated for \$517.99. They brought up sufficient money to pay the wages of the men for the last month, and also to satisfy the claim of Geo. Newman. For the latter purpose, the money has been placed on deposit in Ginnocchio Bros.' store. An application was made to the court to have the attachment released on both real and personal property on giving bonds in an amount to be fixed by the court; and the court on Tuesday granted an order lifting the attachment on furnishing a bond of \$8000. E. and A. Ginnocchio are the sureties on the bond. From this action it would seem that the company intend to contest the claim of Newman, or at least delay the payment of the debt. It is claimed that no demand was made for payment, and that the full bill was not received until after the suit was commenced. The mine and mill are running as usual.

MISCELLANEOUS.—Eight men were started to work this week grading for a mill at the New York mine, in John Bull gulch, about three miles southwest of Jackson. This property has been operated for many years on a small scale by W. G. Anderson and co-owners. They have now got some S. F. capitalists interested, and the work of putting up a mill, preparatory to the active prosecution of mining, will be pushed ahead.

AT PLYMOUTH.—*Cor. Amador Ledger*, August 22: The Good Hope mine is running a full complement of men, and making some very flattering developments in what appears to be a large body of ore. The Reeves mine is sinking the shaft. This mine has always been a success in a small way of working, but we notice of late the owners have increased their force of men from half a dozen to about 20, and are putting on more as fast as they are needed. The Plymouth Con. and New London are working as usual.

Calaveras.

UNION MINE.—*Prospect*, Aug. 22: Mr. Gilbert, the efficient and energetic superintendent of the Union mine is pushing things there now. A large quantity of rock is on the dump, and in a few days the mill will be started up. There is rock enough out now of good quality to keep the mill running for some time, and the mine is in shape to furnish all the rock the mill can crush.

SALE OF MINING PROPERTY.—Chas. G. Wheelock and Wm. A. McNaughton, who have been prospecting mining property in this vicinity went below Saturday. We learn that Mr. Wheelock has purchased the Swank mine on Willow creek, and a half interest in the new discovery of Byron Swank near by. A ten-stamp mill will at once be erected, and the work of crushing rock commenced. The Swank mine is sufficiently opened to admit the extraction of ore at once.

MINE BONDED.—The old Cap Thorpe mine, generally so-called, situated near Fourth Crossing, has lately been bonded we understand, to Hayward & Hobart, and work will soon be begun in it again. This has been a good mine, and we believe that it will prove to be still good.

BALD HILL MINE.—The parties, Messrs. Porter & Robertson who have bonded the Fred Brunner, or Bald Hill mine at Angels, evidently mean business, as they have commenced the erection of hoisting works, and are preparing to work the mine on an extensive scale.

THE ORCHARD MINE.—The Fisher Brothers have been bauling timbers and lagging, from the Fisher ranch to the Orchard mine in town this week. We hear the mine is looking fine the past few days, and some excellent prospects taken out.

AROUND MURPHYS.—*Calaveras Prospect*: The project of running a tunnel through the hill between this place and Douglas by McCormick, Bisbee & Thomas will ere long be put under way and it is expected that by a year the work will be put through to the main diggings. A flume will then be constructed through the tunnel having an outlet on the Douglas side and the rich deposits will then be worked upon a plan of economy and science. There is a theory extant that in running this tunnel the owners will strike a rich vein of quartz as howlers of great richness have been found in many localities on this hill.

HORSWILL MINE.—*Chronicle*, August 22: Work is being pushed right ahead in the Horswill mine near the Flume House. The incline is now down over 480 feet. It is calculated that 150 feet more will have to be run before the bedrock will be reached.

El Dorado.

NEW MILL.—*Georgetown Gazette*, Aug. 22: Work of putting up the mill on the St. Lawrence mine began to-day, under the supervision of G. H. Roelke of Spanish Flat, the well-known carpenter and millwright. Judge Harmon of Oakland is up this week inspecting and directing operations of his Darling mine. The shaft has reached a depth of more than 80 feet.

Nevada.

THE ROACH PROPERTY.—*Grass Valley Telegraph*, Aug. 22: The Hartley M. Co. have purchased the Roach mining ground, or what is known as the Wingfield Scott ledge. To-day the directors met at the Citizens Bank and paid the first installment on the purchase. The ledge is a continuation of the Lone Jack, Homeward Bound, Omaha and others—they are all the same ledge called by different names. About \$5000 worth of development work has been done on the property and about \$600 worth of gold has been taken from the quartz,

The company will immediately put up hoisting and pumping machinery and when that is completed a new incline will be sunk. The company have great faith in their new venture and will spare no pains in thoroughly developing it.

STRIKE IN THE DELHI.—We are informed that a very rich strike has been made in the Delhi mine within the past two or three days. The mine is near Moore's Flat and Robert McMurray is the principal owner. There has been a great deal of money taken out of the Delhi mine and the strikes have been numerous, but the one made the other day is said to far excel any of the rest in richness, as there seems to be more gold in the quartz.

CALIFORNIA MINE.—*Grass Valley Tidings*, Aug. 21: A cleanup from 14 loads of ore from the California mine was completed Friday evening, the yield approximating that of the first crushing. Work on the new hoisting works is under way, and when completed a five-stamp mill will be constructed. At a meeting of the directors held Friday evening, P. H. Paynter resigned as a member of the board, and is succeeded by Mr. Payne of Sacramento of the firm of Booth & Co.

STRIKE AT THE NORTH BANNER.—North Banner mine stockholders are feeling much elated, for aside from the fine bodies of ore in the drifts, the ledge has again been cut in the shaft. The vein is large and the ore evidently of as good quality as that in the drifts and stopes above.

A BIG NUGGET.—*Transcript*, Aug. 21: Jerry S. Goodwin, who is operating the Uncle Sam drift mine near You Bet, yesterday panned out a \$656 nugget of gold while prospecting some dirt in the face of the drift. The chunk is the largest unearthed in that part of the county. It is shaped much like an early rose potato, and is about 1½ inches thick and three inches long. A little quartz adheres to one side of it, and the gold is comparatively smooth, as though it had been washed some distance. Last year, in a canyon in the same vicinity, Mr. Goodwin found a small howler that contained \$177 worth of gold running through it in one streak.

Plumas.

AT LA PORTE.—*Plumas National*, Aug. 22: While at La Porte last week we were shown a piece of quartz by Mr. D. M. Merkle that came from the '89 mine, near Holland Flat, that was very rich. This mine is owned by Cox & Downer, who have developed a well-defined ledge from six inches to three feet in width. A mill will be put up on the mine next summer.

TABER—H. Taber has resumed work on his old drift claim, the owners having recently incorporated under the name of Taber G. M. Co. The tunnel is in over 2000 feet, and work will be pushed rapidly.

San Bernardino.

TIN AND GOLD.—*Riverside Press and Horticulturist*, Aug. 15: James H. Crossman, superintendent of the Gavilan gold mines, was in the city yesterday, and in an interview we learned several items of interesting news. He stated that Col. E. N. Robinson, general manager of the San Jacinto estate, limited, started for London yesterday to meet the board of directors at a special meeting called for the purpose of inaugurating a system for "farm letting" portions of their immense property to small holders—farmers, stock-raisers, miners and other industries—the San Jacinto estate retaining possession of the tin mines situated in the vicinity of Cajalco, and systematically working them for their value. During Col. Robinson's absence Capt. Stephens will take temporary charge of the property, with the assistance of Purser Hugh Stephens. We congratulate Col. Robinson on the able manner in which he has managed this vast property, the resultant effects of which are shown in the last run of five days of the furnace, which yielded 6½ tons of metallic tin, 99 per cent fine—shipped to W. W. Stewart, San Diego, the company's agent—with immense reserves of the stanniferous product in sight on the mine.

The tin property, as a whole, has great merit, and has been pronounced not only by Capt. Harris but by all other Cornish experts who have examined it, as superior to any in Cornwall. It is also due to Col. Robinson's tact and good judgement that the company has secured so advantageous a lease of the Gavilan gold mining district to M. C. Westbrook and associates. The property leased is a principal-ity in itself, consisting of over 4000 acres of mineral and agricultural land comprising not only rich mines but a large area of rich agricultural land. This company, under the management of M. C. Westbrook, with the able assistance of the well-known mining expert and mineralogist, J. H. Crossman, will soon be placed in a condition to show results satisfactory to the lessees. What has been called Gavilan will henceforth be known as Westbrook, where a large number of miners, artisans and laborers will soon find employment. Supt. Crossman is on the ground with a force of men digging ditches, building reservoirs, clearing ground and making preparations for the reception of mining machinery for the development of the gold-bearing veins. There will be three main shafts sunk, called the Washington, the Gavilan and the Hoag, and an adit level will drain all of them. The mill-site has been selected and the town-site of Westbrook laid out. Mr. Crossman informs us that it is the intention of the company to plant trees of various kinds, fruit and ornamental, and to not only develop the mines but to beautify and ornament the place in a variety of ways.

Sierra.

EXTENSION CO.—*Mt. Messenger*, Aug. 22: Bald Mt. Ex. Co. cleaned up 123 ounces, 3 pennyweights and 18 grains for the past week's labor—only 26 drifters. One nugget weighed 11 ounces, and others, varying from one, two, three ounces and upward. About 60 men are employed at the mine, inclusive of the carpenters at work on the new boarding-house, by the completion of which the force will, undoubtedly, be largely increased as soon as more water is available for washing. An upraise has been made from the down-stream tunnel into rich gravel, and breasting commenced. Everywhere operations are progressing favorably under the efficient direction of Supt. Meikle, aided by his able and energetic foremen and a crew of as skillful and industrious miners as ever employed in Sierra county. The output of gold for August will be from \$8000 to \$10,000.

CARLSEN.—In the Carlsen diggings, a mile and a half below town, the lessees, P. C. Johnson & Sons, have struck bedrock, having sunk a hole 20x20 and over 20 feet deep, with a connecting cut for drainage, and soon drifting will be commenced.

ARIZONA.—Two men have just been engaged to

work by the Arizona Co. at their drift mine east of Forest City, beginning operations last Monday. Soon as the necessary outside labor is done, an upraise will be made in search of gravel that may be not far away. Work is being vigorously prosecuted in the Maple Grove tunnel, Kanaka Creek, Alleghany, with fair prospects of soon reaching pay gravel.

RUBY.—The cleanup of the Ruby drift mine last week was 116 ounces. Everything progresses favorably at the mine, under the able direction of Supt. Colman.

THISTLE SHAFT.—Work at the Thistle shaft, Gibsnville, is being vigorously pushed forward in the main tunnel, at a depth of 450 feet up the ridge. Thirty-five men are employed in the mine.

Tuolumne.

THE NORWEGIAN MINE.—*Union-Democrat*, Aug. 22: The Norwegian mine, situated on the northwest side of Jackass hill, two miles distant from Tuttletown, and owned by John Lawson and two sons, has been doing the fair thing lately by its enterprising and persistent owners. Last week they took out between \$1100 and \$1200, and more in sight.

Ventura.

OCHRE.—*Ventura Free Press*, Aug. 21: Three cars of red, white and yellow ochre are now being loaded at Fillmore for a large paint company at San Francisco. This shipment is a sample lot, and is taken from the Grimes mine, three miles from Fillmore. It is pronounced by experts to be of the finest quality yet marketed. It is expected that a new industry will be the result of this introduced shipment.

GYPSUM.—The gypsum mine, on the Ojai, has been shut down for about a week or two. The shaft is down about 125 feet, and in order to keep it free from gas, a pump is necessary to keep it clear. New machinery is expected shortly, and it will then start up.

NEVADA

Washoe District.

CON. CAL. & VA. MINE.—*Virginia Chronicle*, Aug. 22: There have been extracted from all parts of the mine during the week 1065 620-2000 tons of ore, of which 933 370-2000 tons was shipped to the Morgan mill and 132 250-2000 tons to the Eureka mill. The average assay value of all of the ore worked at the Eureka mill during the week (1380 tons) was \$21.67 per ton. Bullion shipped to Carson Mint \$52,851.05.

OPHIR.—1465 level: We have continued our prospecting work from the openings in the vicinity of the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level. A very few tons of ore have been extracted.

MEXICAN.—On the 1465 level, the south drift started from the east crosscut No. 1, at a point 618 feet in from the main north lateral drift has been advanced 31 feet; total length, 187 feet; in vein porphyry showing clay separations.

UNION CON.—The northeast drift started from the east crosscut No. 2 on the 1465 level, at a point 853 feet in from the main north lateral drift has been extended 39 feet; total length, 159 feet; in vein porphyry carrying some clay, and fine lines of quartz of low assay value.

ANDES.—On the 420 level, north drift from east crosscut No. 3 was extended 16 feet in quartz.

MCDUGALL TELLURIDE MINE.—Re-timbering west tunnel and winze. Work of extracting ore from 300 level will be resumed at an early date.

UTAH.—On the 725 level, the southeast drift from the winze station is advanced 175 feet; still continuing in clay and quartz formation.

OCCIDENTAL.—Have extracted and sent to the mill from all parts of the mine a total of 302 tons of ore of the average value of \$19.91 a ton. Southeast drift from No. 2 crosscut on the 650 level is in 31 feet, face showing \$25 ore. The upraise started from No. 2 crosscut on the same level is up 12 feet in ore assaying \$16 per ton.

SIERRA NEVADA.—On the 630 level, west crosscut No. 1 from the northwest drift, 571 feet from the shaft, has been advanced 40 feet; total distance, 850 feet; the formation for the last 20 feet has been softer, with clay now appearing in the face.

ALPHA.—North drift from west crosscut, 100 feet north of shaft, 500 level, is out 68 feet; face in quartz yielding low assays.

EXCHEQUER.—East crosscut on north lateral drift, 150 feet south of the north line, 600 level, is out 37 feet; face in clay and quartz.

CHOLLAR.—Extracted and sent to the mill the past week \$16 tons of ore, worth \$19.91 per ton, as per battery assays.

POTOSI.—The east crosscut, 70 feet south of north line, 1100 level, is out 47 feet, face in porphyry yielding low assays. The east crosscut, 100 feet south of north line, 1200 level, is out 58 feet; face in clay and porphyry. The east crosscut, 140 feet north of south line, 1300 level, is out 61 feet; face in porphyry. Are cutting out a station in the winze, 1400 level.

SILVER HILL.—Southwest drift, 50 level, is out 225 feet from the shaft; face in quartz yielding assays from \$10 to \$20.

BULLION.—During the week there has been no work done in the south lateral drift from the Potosi 1300 level.

WARD SHAFT.—The southwest drift from the shaft, 1800 level, is out 240 feet; face in clay and porphyry.

CON. NEW YORK.—The west crosscut, 230 feet north of shaft, 650 level, is out 20 feet; face in clay and porphyry. The north lateral drift, 1100 level, is out north of shaft 635 feet; face in quartz and porphyry yielding low assays.

GOULD & CURRY.—200 level: Upraise No. 2, has been carried up 10 feet, through hard porphyry and quartz; total height, 125 feet.

BEST & BELCHER.—1100 level: East crosscut from northwest drift has been extended 18 feet through porphyry and stringers of quartz; total length, 118 feet.

Breyfogle District.

CHISPA.—*Carson Tribune*, Aug. 19: Surveyor-General Jones received last Thursday a quantity of pay ore from the Chispa mine in the above-named district. It was discovered by Mr. Montgomery and has been thoroughly prospected. A ledge fully developed and from 2 to 14 feet wide contains ore which works from \$18 to \$30 to the ton, and the

chances are greatly in favor of finding very much richer ore. A ten-stamp mill is in course of construction and work will be vigorously pushed. The property is in Nye county in the vicinity of Death Valley. There is no foolish bling about the discovery, but all on merit.

Eureka District.

RUBY HILL TUNNEL.—*Eureka Sentinel*, Aug. 22: Gentlemen who have visited the above tunnel recently report the new find as still improving. Not enough work has yet been done, however, to determine the extent of the ore body, but the outlook is very encouraging. The work has the appearance of being on the outer edge of a good-sized body. The greater value of the ore is in gold, an average sample assaying \$22 in gold and \$2 in silver. This tunnel does not enter Ruby Hill, as its name would seem to imply, but goes for the bowels of Prospect Mountain from the west side and near the north end. The tunnel is in a distance of 1800 feet. Other good indications were passed farther back. More attention will be devoted to drifting and crosscutting from this time on.

Hawthorne District.

LAPANTA.—*Walker Lake Bulletin*, Aug. 20: The stopes above the east drift, No. 6, looking about the same. The ore found in the east drift from the winze below the 100-foot shaft level has opened out to about two feet in width, going down, and are now running another crosscut from the winze near the bottom to cut it about 30 feet deeper. The ore runs from \$60 to \$100.

PAMILCO.—Work is being prosecuted at three points; all showing well.

CENTRAL.—Still stopping above the 150-foot level, producing the usual amount of ore. Hauling ore for shipment.

MOUNTAIN KING.—North drift on main vein still being extended.

FAIRMOUNT.—Still drifting south in the main tunnel and north from the bottom of the winze. All points producing well.

HARTFORD.—Ledge holding about the same, producing lead and gold ore.

GOLD BAR.—Still producing ore, producing the usual amount of high-grade ore.

NEW YORK.—South drift on the vein being extended; vein showing very strong, carrying lead, silver and gold.

WAR EAGLE.—Are still driving tunnel ahead to tap vein below old workings, and also stopping small amounts of ore.

RIP VAN WINKLE (Marietta).—Main tunnel being extended on the vein showing eight inches of galena in the face, assaying 70 per cent lead, 46 ounces silver.

JENNY LIND (Marietta).—Vein in the north drift still continues strong, about 18 inches wide; ore improving in quality, assaying 70 to 80 ounces silver.

Tuscarora District.

NAVAJO.—*Times-Review*, Aug. 21: The work on the 350-foot level is without material change since last report. Everything running smoothly.

COMMONWEALTH.—East crosscut from bottom of winze below the fourth level extended 18 feet; total from winze, 52 feet; top of drift is cutting into the vein.

DEL MONTE.—Third level—No. 1 north drift advanced 26 feet; vein is larger; small seam of ore in the face. No. 2 north drift extended 27 feet; face of drift in vein formation giving low assays. No. 2 joint raise extended 17 feet.

NORTH COMMONWEALTH.—Fourth level—Raise from east crosscut put up 15 feet; work at this point discontinued.

BELLE ISLE.—Have started to crosscut for the vein on the 450-foot level, which recent developments indicate to be some distance beyond the present workings. The winze has been connected with the 450-foot level.

NORTH BELLE ISLE.—East crosscut from the south gangway, 400-foot level, extended 20 feet. North drift from the south-line crosscut, same level, extended 13 feet; the ore in the face continues to show more or less bright ruby. South drift, 500-foot level, extended 18 feet. No. 1 upraise, same level, extended 10 feet, showing some very good ore.

ARIZONA.

GOLD BULLION.—*Prescott Journal-Miner*, Aug. 19: Another bar of gold bullion was brought in yesterday from the Quartz Mountain mine. It is rumored that the Commercial M. Co. will shortly commence the purchase of custom ore from their Senator mill. The tunnel of the Senator mine is now in nearly 600 feet, and work on it continues to be pushed. The Senator mill is only running 12 hours per day on account of scarcity of water. Jasper Phillips, who is working the Wren mine, owned by Bigelow & Smith, on Slate creek, under lease, has been taking out good ore.

TOMSTONE M. & M.—*Prospector*, August 19: From the annual report of Superintendent W. F. Staunton, the following is taken: Shipments to the smelter for the year ending June 30th, 1891, have been as follows:

	Dry Wgt.	Contents
	Tons.	oz silver oz. gold
Lucky Cuss.	2 270.805	124 681.89 1,681.87
West Side.	1 115.252	81,004.58 1,526.61
Northwest.	458.002	3 275.46 98.69
Assay Office.	14.884	773.90 8.18
Charleston.	42.406	2,589.91 23.67
Total.	3 891.409	239,801.80 3,339.31
		Average grade per ton—
		lbs. lead oz. silver oz. gold
Lucky Cuss.	145.313	54.995 .74
West Side.	316.136	73.29 1.38
Northwest.	116.836	67.14 .215
Assay Office.	2.882	52.00 .55
Charleston.	6.666	61.67 .56
Total.	586.433	61.625 .858

Compared with the production of the previous year, the above figures show a marked increase in the total number of tons shipped and in the average grade of the Lucky Cuss ore. The decrease in the grade of the Sulphuret and Northwest ores has been more than offset by the increased tonnage, and the percentage of lead in the ores from all three mines has been much improved. Payment is received for lead only when it exceeds five per cent, and the quantity of lead given above, is only that upon

which payment has been received. More than half of the Lucky Cuss ore has contained but five per cent of lead and under. In general appearance the mines have continued practically unchanged throughout the year. While there have been no discoveries of ore bodies of any considerable magnitude, the many small ones in new localities which have been found have enabled us to maintain, and latterly to increase, our monthly output without curtailing the development work, and still leave the mine in good condition for the coming year. The development work, comprising drifts, winzes, raises, etc., has aggregated nearly 8000 lineal feet. The machinery at the various mines has been kept in good condition and improved. One hundred and seventeen men are employed at present, 96 at Tombstone and 21 at Charleston.

BRITISH COLUMBIA.

GALENA NEAR BALFOUR.—Nelson Miner, Aug. 12: T. G. Proctor, R. S. Gallop and J. E. Stark report making a find on a creek that empties into the outlet nearly opposite Balfour, the find being about five miles distant from that village. The ledge is reported of good width where uncovered, the vein matter carrying buoches of fine-looking coarse-grained galena.

THE DANDY.—Good progress is being made on the Dandy. The lower tunnel run on the ledge is being advanced nine feet a week, and the crosscut tunnel to tap the ledge about 14 feet. The latter will be about 200 feet long, and will tap the ledge about 85 feet below the bottom of the shaft. This will not only afford drainage, but allow of drifts being run both ways on the vein. The lower tunnel, when it reaches a point below the shaft, will be 175 feet below the crosscut tunnel. A. M. Esler, who is now on the ground, is not only well pleased with the way the work is progressing, but is sure that his company has a mine. Power drills will be put in as soon as it is demonstrated that the electric drills now being tried in the Cœur d'Alenes are a success, preference being given the electric over compressed air.

MINING NEWS FROM HOT SPRINGS DISTRICT.—The crosscut from the bottom of the Skyline is in very hard rock, and slow progress is being made. An indication that seems favorable to a near approach to the ledge is the seepage water, a considerable flow being encountered this week. The Number One continues shipping ore, two carloads being now on the railway wharf at Nelson, awaiting shipment to East Helena, Montana. A good strike is reported in the Saxon, a Cedar creek claim. The Crescent has a fine showing of ore in the bottom of a 45-foot shaft, but, for some reason, work has been suspended. A bond has been given on the Neosho, a claim that is believed to be one of the richest in the district, at figures up in the thousands.

MONTANA.

THE DREGGES AT THREE FORKS.—Mining Journal, Aug. 19: It is now stated that the dredges and amalgamators working the bars of the Jefferson river for gold, the enterprise, at the head of which is ex-Senator Tabor, of Colorado, are working most successfully. The plant is handling 60 yards of gravel an hour, the gold recovered averaging from 90 cents to \$1.20 per yard. One shift of 16 men is employed to operate the machinery.

EMIGRANT GULCH.—Samuel Marchington, of Emigrant Gulch, in Park county, is visiting Helena. Considerable placer mining is being done this season, which will result in good cleanups and the "boys" will be able to carry on developments of the quartz leads, there being many promising ones in the camp.

BELMONT AT MARYSVILLE.—In its palmy days the old Belmont, above Marysville, was a famed bullion producer. A report has been making the rounds of the streets recently that Helena parties have secured a lease and bond on the property, and that the mine will soon be reopened and the mill started. It is to be hoped that the rumor is well founded.

AT BUTTE.—Miner, Aug. 20: While the mining arena was not visibly disturbed by any extensive new discoveries in Butte during the week, there was variation from the customary steadiness of the regular production. Some few new leases on properties were taken, while a few old ones expired and were thrown up; but this is the case week in and week out, and what may be called the regular production is not affected at all thereby. The Moulton, Alice, Bluebird, Butte and Boston, Colorado, Boston and Montana, Butte Reduction, Lexington, Parrot and other smaller companies have made their regular shipments of copper, silver and gold, and expect to continue right along. Owing to repairs in progress at the Lexington mill, the shipments by that company were not so large as during some of the previous weeks. With many of the mining companies, repairs and additions seem to be the order of the hour. The Boston and Montana has just finished some needed repairs at the smelters, and is now engaged in the task of erecting a first-class piece of hoisting machinery on the new shaft. At the Butte and Boston, the two new O'Hara furnaces have received the finishing touches, and will be fired up for business in a day or two. The Alice Co. is making extensive improvements in the shape of the addition of a large air compressor at the main shaft. The workings of the mine are also being extended, and the shaft deepened to the 1500-foot level. The Blue Wing, Alice and Magna Charta are yielding enough to keep both mills pounding away night and day. The shipments of bullion from these works during the week were as large as during any former week. The Boston and Montana works and principal mines are running full blast. The largest portion of the ore used at the works is being taken from the two Colusas at present, that is the veins of the Moulton View and Harris-Lloyd being held in reserve. The Butte and Boston is getting to be one of the colossal companies of the camp. It started in on a small scale about three years ago, since which time it has been gradually increasing its possessions, until now it has a daily capacity of over 400 tons. In addition to one of the best plants in the State, the company has about 33 mining claims, all located within a mile of the works. These claims are all good, or the company would not own them. As to the Anaconda, nothing of a startling nature has occurred during the last seven days. The large tanks in both the Anaconda and St. Lawrence are still engaged in taking out the water, and will be for the next few weeks to come. If the mines do not

start up after the water is taken out, a few men will at least find employment timbering, cleaning up and keeping the property in shape for future use. The Wild Bill is one of the coning properties of this camp, as it is situated squarely in the copper-silver belt. All the other syndicate mines are as quiet as a graveyard, there being nothing about them that would lead one to believe that the end of the shutdown is near at hand.

THAT BIG GOLD PROPERTY.—Inter-Mountain, Aug. 19: Willard Bennett to-day received word that the five-stamp mill for the Royal Gold & Silver M. Co. was ready to start from Chicago. This is for the very valuable gold property in the Boulder district, of which mention was made in these columns recently from an interview with Mr. Turney of Anaconda, one of the principal owners. Mr. Bennett has acquired a four-sevenths interest for a consideration of \$30,000. He had a ten-pound package of ore from this property a few days ago which contained pure gold and silver, its value being \$248 in gold and \$570 in silver. The lead is termed a "blind" lead, as it is hidden under a formation of decomposed granite from 6 to 12 feet thick. This has been sluiced away in several places, exposing the rich ore. The property is three miles in a direct line northeast of Granite mountain, on Divide creek, between Gold creek and Boulder.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUG. 18, 1891:
457,862.—BRUSH—E. F. Chumara, Colfax, Wash.
458,101.—FLUID PRESSURE BRAKE—E. B. Denison, Pine Grove, Cal.
457,825.—WATER WHEEL—F. Lundberg, Tacoma, Wash.
458,033.—SASH BALANCE—J. P. Magney, Oakland, Cal.
458,060.—WAVE POWER—W. Mulholland, Los Angeles, Cal.
457,935.—HARNESS.—J. R. Phelps, Sacramento, Cal.
458,120.—INSERTED SAW TOOTH—Rogers and Howe, Laurel, Cal.
457,937.—DENTAL ARTICULATOR—C. R. Sabin, St. Helena, Cal.
457,938.—MACHINE FOR SHAKING LIQUIDS—R. D. Schroeder, S. F.
457,939.—LOCOMOTIVE.—Paul Seiler, S. F.
458,076.—PUNCH—F. N. Simmonds, S. F.
457,882.—WINNOW CHAIR—E. T. Steen, S. F.
457,940.—FRUIT PITTER—W. Stevenson, Vallecito, Cal.
457,803.—CARBURETOR—O. Vanorman, Los Angeles, Cal.

The following brief list by telegraph, for Aug. 25 will appear more complete on receipt of mail advices: California—Peter Abramson, S. F., fire chamber vent; John W. Baker and J. Lacy, Bakersfield, cutter bar attachment; William H. Bast, Olinia, square for rafter and stair work; Naaman L. Darling, assignor of one-third to J. R. Dixon, Los Angeles, harvester; Adolph L. Gerleke, Sonoma, farm gate; Clarence V. Greenmeyer, S. F., electric power brake; Adam Harford, Colton, wheeled road car; Heber L. Heath, S. F., elevator; James M. Ish, S. F., fruit-grading machine; David B. Jones, S. F., quartz mill; Milton W. Lipe, San Jose, flour packer; George F. Mo'n, Los Angeles, electric uterine supporter; Moore Noble, S. F., vapor formig attachment for grates. Oregon—Addison Goodrich, Astoria, packing extractor.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MACHINE FOR SHAKING LIQUIDS.—Richard D. Schroeder, S. F. No. 457,938. Dated August 18, 1891. This is one of that class of machines which are used for holding and shaking a receptacle in order to thoroughly agitate and mingle the ingredients of beverages and other liquid compounds. The object of the invention is to provide a simple and effective machine of this character adapted to readily receive the shaker and tumbler, and to hold them tightly while being vigorously vibrated.

STUMP PULLER.—Wm. B. Morris, Seattle, Wash. No. 457,092. Dated Aug. 4, 1891. This is an improved apparatus for extracting stumps, pulling heavy weights or for other similar heavy work. It consists of eccentrics or cranks fixed to a suitably journaled shaft with means whereby it may be anchored and rotated, and a draft bar with automatically operating locking devices, whereby each of the eccentrics alternately pulls upon the draft-bar. It also consists in a means for taking up any slack rope and in certain details of construction.

HARNESS.—James R. Phelps, Sacramento. No. 457,935. Dated Aug. 18, 1891. This is a device which is intended to give the proper gait to horses when traveling and prevent their interfering or hitting themselves. The gaiting device consists of swinging arms, a means of connecting their lower ends with the horse's legs, and journal boxes within which the upper ends of these arms are swiveled to turn or oscillate, a forked supporting frame for said journal boxes having its separated ends extending over the horse's back, and means for connecting said ends to the harness or vehicle shafts whereby the device is supported and steaded.

DENTAL ARTICULATOR.—Chas. R. Sabin, St. Helena, Napa Co. No. 457,937. Dated August 18, 1891. This device is used in the manufacture of plates of artificial teeth. In the process of preparing dental plates, the usual steps are to take an impressio of the mouth in suitable plastic material, to make from said impression the models, usually of plaster, to take another impression of the mouth in wax in order to make the bite or articulation to fit the wax impressio to the plaster models and to place the whole model of the mouth in the articulator. There is always a difficulty in getting the bite or articulation, and unless this be done suc-

cessfully, the resulting work will be imperfect. The chief difficulty arises from the inability of the patient to control the movement of his lower jaw with sufficient accuracy to make a perfect and natural articulation. It is the object of this invention to avoid this difficulty by the provision of means which will insure this accuracy and give a proper bite or articulation.

LOCOMOTIVE.—Paul Seiler, S. F. No. 457,939. Dated Aug. 18, 1891. This invention relates to certain improvements in locomotive engines whereby the application of power and the effective tractive force of the engine are greatly increased. It consists in the employment of two sets of wheels of equal diameter, one set running upon the track and the other journaled directly above the first set, with their peripheries traveling upon the peripheries of the lower set, the weight of the engine being entirely carried upon the axles of the upper set of wheels. Both sets of wheels are connected together by the usual side-rods, and each set is independently connected with the single cross-head, which is reciprocated from the cylinder in the usual manner. Power being applied through the cylinder to the cross-head, the action will then take place equally upon both sets of wheels, the cranks being alternately in the position nearest to each other and farthest away, or upon the opposite sides of the centers of the wheel. When power is applied through a crank to a wheel traveling upon the rails, it will be manifest that when the crank is at the highest part and farthest away from the fulcrum (which is represented by the rail upon which the wheel travels), its power for propulsion is the greatest; but when, by a half revolution, it has arrived at a point between the axle and the rail, the leverage becomes such that the least power to move the load can be applied, and the tendency of the wheels to slip is at its greatest when the cranks are in this position. By Mr. Seiler's construction, it will be seen that when the cranks connected with the lower set of wheels are at the lowest point, those connected with the upper set of wheels are at the highest point and are consequently in position to apply the power to that set of wheels to the greatest advantage, while the power is being applied to the lower set of wheels with the least advantage. By reason of the whole of the weight being supported upon the journal boxes of the upper set of wheels, it will be manifest that the weight is transferred through the peripheries of these wheels to the peripheries of the lower wheels, and by frictional contact the power is transferred to the peripheries of these wheels, thus applying it constantly at a point which is at the greatest distance from the fulcrum.

FRUIT-PITTER.—Wm. Stevenson, Vallecito, Calaveras Co., assignor of two-thirds to Luke Sanguinetti of same place and David Barattini, of Murphys. No. 457,940. Dated Aug. 18, 1891. The present machine is an improvement on patent No. 417,885. Dated Dec. 24, 1889, issued to Sanguinetti and Stevenson. The fruit is placed in a V-shaped feed-chute and on account of this V-shape and the corresponding V-shape of the guide piece, the fruit is fed down in the same way each time, so that each fruit will be cut uniformly in the center—that is to say a guide is thus provided for feeding the fruit centrally to the knives. The fruit is held by a blade, and as the cutter rotates its knife-like points cut the flesh of the fruit to the pit, so that said fruit is divided, and both the halved flesh and the pit drop into an inclined shaking screen, through the meshes of which the pits drop, while the flesh passes down the screen into a suitable receptacle below.

Mining Share Market.

The mining share market the past week, showed continued dullness in outside mining shares, with hardly a cross-order to establish quotations. In the comstock there was more life through cross-orders. The pool finds it hard work to draw in outsiders to operate, although every little while they do manage to hook a gudgeon, but these being "small fry" they are soon financially done for. Report says that the threatened Iowa claim dispute has been compromised, but with the threatened suit by West Con. Virginia and the suits already in court, against the Savage Mining Co., and another against the Hale and Norcross management, it is hard to get up any kind of enthusiasm, particularly when outsiders believe that the mill rings are still in the ascendancy, and that as long as the latter control the former can only look for assessment for share holders and bullion for the rings. It was hoped that Col. Mackey would give personal attention to the serious charges preferred against the rings, so far as his and Com. Flood's particular mine is concerned, but so far we are not advised that any such action has been or is contemplated; yet for the good of the mining industry and his own keen sense of justice, we still think that the Colonel will investigate the charges and not be swayed by others. If the mines and mills are honestly worked, the officials should court an investigation, and if they are not so conducted, then the sooner it is known and the wrong righted, the better it will be for our leading industry.

The owners of the mills running on ore from the Gold Hill and Middle mines have the writers heart-felt sympathy in this, the hour of their bereavement over the lack of water to operate the mills, so as to run the mines in debt while crushing ore.

Rumors are flying thick and fast, and to ferret them out is more difficult than to catch a feather in a gale of wind. The latest put out is that Col. Mackey will leave soon for the East. While this may be so, yet he seldom, if ever, misses being here at Con. Virginia's annual elections.

The news is of a very encouraging character from the mines in the Tuscarora district, while from the Bodie district our advices report more prospecting work. Who knows but in the latter district, but that they may run into a blind pocket for which it is noted. From the Comstock mines our advices continue of a favorable character. The shutting down of some of the mills will probably cause more prospecting work in the mines affected. The successful killing of time by the persons who have charge of the pumping out of the Gold Hill mines, is causing a spasm of envy from those who would also like to draw a good salary for virtually doing nothing. The work going on in Sierra Nevada and Union, is attracting more attention, and hopes are expressed that good results will follow. If it does, who will

get the benefit, the mill rings or shareholders? Advices report that on Con. Virginia 1800-foot level a west drift has been started. If this is the case, they ought to strike the west lode within the next month. On the 1100-foot level important work is contemplated, yet the management is singularly neglectful of the 1400 level. Why is not this level prospected? In Best and Belcher and Gould and Curry the work is being closely watched. On the 1500 foot level in Savage, the prospects look very encouraging. Hale and Norcross does not report any movement calculated to show up the ore found to the west. The west work on the 1800-foot Ward shaft level ought soon to be approaching an interesting point. The usual kind of work is reported from the Gold Hill mines. The managers of these mines can do much better, if so disposed.

The share market opened this (Thursday) morning dull but strong at a slight advance. The slow but steady growth in prices for the Middle and North End shares is a puzzle to on-looking but anxious outside operators. The latter are expecting something, but what, whether a break or a jump, is not clear to their minds, and to add to their perplexity, Senator Fair comes to the front in the newspapers in a squabble over an electric road. The man who failed to sell when Con. Virginia went up to \$20, expecting it would not be a sell until some one of the Senator's schemes was lauded by the press is in sore distress of mind; he does not know whether to buy more stock or sell what he has. The market acts as if there is a short interest, which, if correct, will send prices up before there is a break.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 27, 1891.

General trade is exceedingly active. The volume of goods going out is larger than at the like date within the history of the city (this information is obtained from various transportation companies). The money market is easy, considering the heavy demands to be met, but with the flow setting this way, the market will be unusually easy. Our advices are confirmatory that interior merchants are getting into better financial condition than for several years. This is due to farmers being free sellers of produce, particularly grain, and for which higher prices are being realized than for nearly ten years. With higher prices for grain and a large crop harvested, the outlook is extremely favorable for a more prosperous year in all industries than ever before enjoyed.

MEXICAN DOLLARS.—The last steamship for China took out \$315,744. The market is reported at around 78 cts.

QUICKSILVER.—Receipts aggregate 202 flasks. The market is essentially unchanged.

SILVER.—The steamer Oceanic took out \$40,000 in bullion for Japan. The market, after falling to about 98 cents, appears to be strengthening. The low range of values in this country and abroad is, to many, a source of surprise. The depression in the face of this country's heavy purchases, bears the ear-mark of a speculative combine, particulars of which will probably crop out later on. There are many speculative securities whose market values are contingent upon that of silver; and with the latter selling at low figures, these securities can be picked up to a much better advantage. The output of the mines in this country does not show any increase, but, on the contrary, there are those who claim that it is less. Probably the pending elections in the Central and Eastern States has much to do with the present situation of the metal.

BORAX.—Receipts the past week aggregate 225 cts. The market is easy, with inside figures now outside figures.

ANTIMONY.—The market continues to shade off.

LIME.—Receipts the past week aggregate 2600 bbls. There is a continued active demand.

LEAD.—Locally, there is nothing new to offer. The Eureka mine is turning out considerable, which finds a ready market.

IRON.—The market is cleaning up, but heavy shipments on the way are against the selling interest. The movements of all kinds of manufacturers to combine against strikes is accepted as favorable and which must unquestionably lead to better times, for, with fears of strikes, business was unsettled. An exchange says that the Great Western Iron and Steel Works at Kirkland (Wash.) is building a blast furnace 75 feet high, with a 17-foot bosh, and will have a capacity of 1000 tons of pig iron per week.

TIN.—The market is strong for plate but weak for pig. The latter sells at about cost of delivery, and to force sales even less has to be accepted.

COPPER.—The market is gaining strength. London cables to Iron Age reports as follows: Copper has ruled stronger under the influence of a good demand for cash warrants and moderate offering following somewhat heavy "bear" selling early in the week. The turn has encouraged operations for long account, and freer buying on the part of consumers, together with good statistical position, has also helped to stiffen the market.

COKE.—The market continues in buyer's favor. Imports the past week aggregate 621 tons from Glasgow. Large consignments are reported on the way.

COAL.—Imports the past week aggregate from Comox, 8700 tons; Seattle, 458; Tacoma, 2909; Carmelo, 200; Coos Bay, 700; Nainaimo, 6201; Departure Bay, 7173; Swansea, 2525; Glasgow, 1090; Sydney, 1920. Total, 35,775. As will be seen by the above, we have added Carmelo to our source of supply. The coal is bituminous. The market for spot and nearby is barely steady, while for shipment, the lower prices are obtainable on a firm offer. The consumption with us is all of 25 per cent greater than at this time last year, but with all the coast from mines resuming work and heavy shipments from abroad, it looks as if the supply will be ample. The coal ships on the way to this port have a registered tonnage, as follows: From Australia ports, 76,503 tons to this port and 17,955 tons to San Diego. Besides this, there are many cargoes on the way from Great Britain. The offering of vessels at Australian ports for coal loading is quite free.

MECHANICAL PROGRESS.

Manganese Steel.

At the late meeting of the American Society of Mechanical Engineers a very interesting paper was read by H. M. Home of Boston on Manganese Steel, from which the following is condensed:

Manganese steel is an alloy of iron and manganese, containing a considerable portion of carbon. It possesses a remarkable combination of great hardness, which cannot be materially lessened by annealing, and great tensile strength, with astonishing toughness and ductility. Resistance to abrasion, to indentation by a sharp object, and to compression, habitually go hand in hand. The alloy is hard, but under some conditions not rigid. An instance of rigidity under shock is that of a manganese steel axle, compared with a special carbon steel axle. Each was struck repeatedly by a 20.75 cwt. ram while resting on supports three feet apart, and each was reversed after every blow, in the usual way. The manganese steel axle received, up to time of breaking, blows representing 43 per cent more energy than those received by the carbon steel axle, yet the total deflection of the former was very much less than that of its competitor.

A case of good behavior under shock is furnished by a 33" m-st. car wheel, weighing 612 pounds. It was dropped edgewise on a one-ton steel block, heeded in the ground, from gradually increasing heights, and the same thing was done with an American chilled cast-iron wheel, and some excellent carbon steel wheels. The total energy represented by the work done on the manganese steel wheel was 100 foot-tons, or twice as much as in the case of cast iron, and twice the amount as in the case of carbon steel.

Manganese steel axles have chopped cold iron bars through. The metal can be worked easily by emery wheels. The most important single use for manganese steel is for the pins which hold the buckets of elevator dredgers. Here abrasion chiefly is to be resisted, and it has given remarkable results. Manganese steel wheels, under a one-horse tram car in Chester, England, were returned after running 180,000 miles. The service under horse cars is very trying, as the brakes are so often applied, and as so much sand and other gritty matter lies on the rails. Some manganese steel wheels have run 300,000 miles each, on a N. E. railroad, without being turned down. Manganese steel can advantageously be used for gears, safes and armor plate.

In the discussion, M. G. C. Henning said that, although manganese steel seems to be very soft, it is found to be tough and hard when crushed. Prof. Rogers and Wm. Kent spoke briefly. President Hunt thought the subject of car wheels important. The aim in this country was to replace the tired wheel by a solid one.

THE CATLIN RAPID-FIRING GUN is the invention of a mine superintendent of Nevada. The gun has a Winchester hand and stock with a 15-repeating magazine in the stock. It is a trifle heavier than the ordinary Winchester, but its great feature, as claimed, is that the whole 15 shots may be fired in one second. This statement may not seem possible, but is claimed to be an actual fact. The shells are thrown out, and at the end of the firing the gun is as clean as though only a single cartridge had been exploded. It is said that an instantaneous photo was taken of the gun in action, and while the explosion was made, five shells were in the air tossed out by the inconceivably rapid working of the gun. All that the man who does the shooting has to do is to fill the chamber with cartridges, cock the gun and then pull the trigger as many times as he means to shoot. The gun is accurate at short or long range.

A NEW ALLOY.—A telegram from Pittsburg of Aug. 17th says that a series of experiments by Thos. Harrington of that city into the properties and uses of nickel steel and manganese bronze have resulted in the discovery of a metal the chief characteristics of which are that it obtains a very high tensile strength and is indestructible by corrosion, being impervious to acids, and that it can be wrought into spikes, nails, etc., while either hot or cold.

A NOVEL HOUSE STOVE is being introduced in England. The grate is swung on trunnions and can be reversed. After fresh coal has been added at the top the reversal is made, and the green coal is thus brought to the bottom. The consequence is that the gases from the coal, passing upward through the red portion of the fire, previously at the bottom, are almost entirely consumed before reaching the chimney.

AN ANCIENT BOILER.—It is said that a boiler that must have been in use some 1800 years ago is exhibited at a museum in Naples. It was unearthed at Pompeii, and is described as being of copper, of small proportions, with a fire-box, a smoke flue through the top, a door on the side, and water grates of small copper tubes crossing the fire-box at the bottom.

WHEN SELECTING PULLEYS or belts, don't be afraid of having the face of the pulley or the belt too wide. Economy will be found in the use of wide belts, if not carried to extremes.

Massive Box Girders.

There has been an interesting piece of work going on for the past three or four months upon the top of the northwest wing of the New City Hall, 80 feet above ground. This work consists of the putting together of what are said to be the largest box girders ever constructed. They are too large to be constructed at any shop or even on the ground adjacent to the building, for the reason that it would be impossible to raise such great weight to put in position, except at an enormous expense of special hoisting gear.

There are five of these girders to be put in place. Two of them are 126 feet long, two others 107 feet, and the fifth 72 feet in length.

A contemporary alludes to this work as follows: The two largest are especially worthy of mention, there never having been equally big box girders placed anywhere. They will have to carry a weight of 300 tons, consisting of the masonry story and the roof of the wing, leaving a clear space underneath for what is at present intended to be an assembly hall. The clear space between the bearings of these girders will be 116 feet and 9 inches. They are six feet nine inches high, 3½ feet wide and weigh 125 tons each.

Forty workmen are employed constructing the girders of steel plates and angles. These are riveted together with hot steel rivets one inch in diameter by an air-riveter with a pressure of 38 tons to each rivet.

An idea of the greatness of the undertaking may be formed when it is said that 35,000 rivets are to be used, weighing 40,000 pounds, some of them being seven inches long. The plates are from 29 to 50 feet long, and from three and one-half to six feet wide. They are three-quarters of an inch thick.

To carry out this work, \$4000 worth of machinery had to be procured and a scaffolding containing 12,000 feet of lumber had to be constructed.

On the ground floor are a hoisting engine, a hoiler and another engine to run the furnaces for the riveting machine, with an air tank and a compressor. On top of the wing, the hand forges and furnaces for heating the rivets are located, besides the riveting machine, which is run by compressed air brought in pipes from the tank below, under a pressure of 75 pounds to the square inch.

The contract price for the work is \$62,449, and the girders will be completed, barring unforeseen events, by Sept. 1st.

All the work is done in this city, with the exception of the plates, which had to be imported. Even the machinery used has been manufactured here.

THE CUSHION CAR WHEEL.—The latest invention to attract the attention and approval of railroad men is the cushion car wheel, which is said to possess many advantages in the way of simplicity, safety and economy, while at the same time being almost noiseless. The wheel is composed of two parts, the centre and the tire, while between the two is a thick rubber band which acts as a cushion to absorb all the vibrations. By a peculiar construction, the tire is made so that it may be removed without taking the wheel from the axle. The rubber is so interposed between the centre and the tire as not to be liable to injury from a hot box or from the corrosive action of the lubricants. A test recently made with these wheels showed that after a service of over 20,000 miles the rubber had not deteriorated, while the tire showed a wear of but a thirty-second of an inch, which is said to be less than one-half the usual wear for this distance.—Boston J. of C.

IMAGINARY DEFECTS.—Many a machine is condemned as worthless or inferior and set aside, not because of actual defects, but because not properly set up or proper connections made. Before condemning an old and well-known machine, one should stop long enough to reflect that hundreds of other people have made the machine operate successfully, and that it is extremely unlikely that the machine contains some mysterious defect which renders it a failure in that individual case.

SHAFTING is cold rolled to the even diameters, and when finished is reduced by the finishing out to about one-sixteenth of an inch less than the nominal diameter, so that when a two-inch finished shaft is ordered, it will come one and fifteen-sixteenths. It is well to bear this point in mind when ordering pulleys bored out for special sizes of shafting. The extreme lengths of shafting ordinarily are from 18 to 20 feet.—Power.

LARGE CRANES.—Some of the monstrous cranes used in the Baldwin Locomotive Works at Philadelphia lift a big locomotive as easily as a mother does a baby. Each of them saves the labor of 150 men, and does away with the necessity of having a complicated system of tracks for shifting locomotives.

SMALL ARTICLES made of malleable iron are now finished and polished bright by being placed in revolving drums with coriander shavings, from which they emerge with all of the rough edges smoothed and the surface highly polished.

PAINT FOR ZINC.—For paint to stick to zinc, use the following wash: Chloride of copper, one part; nitrate of copper, one part; sal ammoniac, one part; water, 64 parts. This coat is left for 24 hours before applying the paint.

SCIENTIFIC PROGRESS.

Mountain Storms, Cloud-Bursts, Etc.

Severe mountain storms and destructive cloud-bursts seem to have been unusually frequent of late in all parts of the country. The vicinity of the flourishing town of Redlands in San Bernardino county has been twice visited with a cloud-burst within a few days, which sent its waters rushing through the center of the business portion of the town, doing but comparatively little damage, however. The mountains back of San Diego were also visited by a very severe cloud-burst, which rushed, with a perpendicular wall of water several feet high, down a ravine, completely obliterating a small cluster of mountain dwellings which it encountered. Fairbanks in Arizona has been almost wiped out of existence by one of these cloud-bursts. Many other places northward along the track of this meteorological disturbance had also suffered minor loss, while storms of lesser violence and destruction have frequently been observed in the mountainous regions of San Bernardino and San Diego counties, during the past two or three weeks, from Oregon to Mexico. Unusually destructive storms have also visited the valley of the Platte river and other localities east of the Rocky mountains.

Salton Lake Not Responsible.

Much comment and correspondence has been indulged in to show that the newly formed Salton lake was responsible for these somewhat unusual meteorological disturbances; but Professor Finley of the Weather Bureau has shown conclusively that such could not have been the case. He has shown by the file of weather maps in his office, which covers and immediately precedes the period of these storms, that phenomena quite apart from the lake have been the cause of these "cloud-bursts" and unusual downpours of rain. He shows that for weeks there had been a condition of vertical air currents producing a barometrical trough extending from British Columbia to Mexico, which currents sent upward enormous quantities of moisture, to which Salton lake had only contributed a mere moiety, but which, when the electrical and atmospheric conditions became favorable, had suddenly condensed and fallen, with disastrous consequences, upon the mountains. The impending occurrence of these storms had been quite accurately predicted by the Weather Bureau observer in this city. Professor Finley had sent out daily bulletins announcing rains in Southern California, and had even forwarded special bulletins to Redlands.

Tornadoes and Cloud-Bursts.

The Rocky and the Sierra mountain ranges are generally considered as the most remarkable of the tornado regions of the globe. The subject of tornadoes and cloud-bursts, especially in the United States, has been for many years made a matter of special study by our meteorologists, and the most minute, systematic and careful observations in relation to them have been recorded, tabulated and studied. Up to within about six years and for the previous period of 87 years, about 600 tornadoes have been especially noted and recorded. Of course, the larger number of these phenomena occurred during the last half of the period mentioned or since the advance of population has moved westward into the more central portions of the storm regions of the continent, affording the opportunity for wider observations. There are three great centers of storm regions in the United States which probably hold good also, as the three chief storm centers of the entire continent. The first and most important has its center a little to the north and west of the junction of the Missouri and Mississippi rivers. The second in importance is in the Allegheny mountains, near the western junction of the boundaries of North and South Carolina. The third is in the central portion of western Texas.

THE AMOUNT OF MOISTURE in the atmosphere is much greater than is generally supposed. Its capacity for sustaining moisture, depends mainly upon its temperature. The atmosphere at 100° F. at the earth's surface is capable of sustaining, in an invisible form, moisture to one-fiftieth of its weight—or an equivalent of one pound of water to every inch of area. Hence it will readily be seen what an immense volume of water may possibly be discharged over any given area, when the atmosphere and electric conditions are favorable for its sudden condensation, as in the case of what are called "cloud-bursts." Warm currents of air, highly charged with moisture, are frequently wafted by the winds over mountains where they meet with a cold atmosphere or a cold current which suddenly forms dense, black clouds, that sometimes drop their moisture in perfect cataracts of rain. These phenomena are usually termed "cloud-bursts," the waters from which find their destructive way down mountain canyons to the plains below, as recently occurred in Redlands and other places in various portions of this State.

DO CLOTHES MAKE A BOY?—"Do clothes make a boy?" No; clothes make clothes. What are clothes? They are an expression of character. A boy who respects himself will dress as decently as he can, simply and cleanly, says Ezekiah Butterworth, in the *Ladies' Home Journal* for August. A boy who respects

the worth of life will not dress conspicuously, even if he have the means. He is best dressed whose appearance excites no special attention and causes no critical remarks. Conspicuous dress goes with a light head, and a very indolent purpose in life. Dress does not make the boy, but it often exhibits him; theatrical dress in society is in bad taste; but everyone owes it to others to look as well as he can. Neglected dress shows a want of self-respect and a lack of self-respect arises as a rule from a sense of cheapness of character. It is often impossible for a poor boy to dress as well as he would wish. But he can always express his well-dressed character by making his clothes neat and tasteful.

Mold on Jam—An Interesting Study.

One of the forms most familiar to us in home life is the *Mucor mucedo*, which attacks our jam. I saw a pretty specimen of this a couple of years ago, when visiting a country house in Shropshire. I was called into the store-room of my hostess to condole with her on the moldiness of her jam. On looking about for an explanation, I found that the kitchen chimney passed up the side of the wall where the jam was kept. Here was favorable condition number one. As I have frequently observed that home-made jam was left to itself for a day or two before being covered, it was not difficult to conjecture condition number two. Indeed the jam pot an exquisite little colony of mildew was flourishing. The jam was more than half gone, shoored into the vitals of the miniature forest.

To prove to my hostess how easy it was to produce a crop of molds on any suitable media I cut a piece of bread from a loaf, moistened it with water, and, to give it the darkness which it prefers, I placed it in a muffin dish with the lid on. Carrying my extemporized laboratory to the warm corner where the jam had stood, I awaited with deep interest the frothifications of the seeds which no eye had seen and which no human hand had sown.

On the second day signs of development had begun, not in one spot, not equally all over, but in scattered dots over the surface of the bread, much like the gelatine plates in the hospital wards. On the third day my garden had burst into flower, and was radiant with molds of varied and exquisite color. Next day my little garden was still quite gay with pink, yellow, violet and dark molasses, all trying to crowd each other out. About the fifth day the little world within the muffin dish was demonstrating the great law of nature, that "all that has lived must die," in that the pabulum which gave life was exhausted and consumed. My brilliant molds were dead, and in their turn were supplying pabulum for another set of organisms awaiting the necessary conditions of their life. At the end of a week all was a jumble of life and death, the bread was being rapidly liquefied and dissolved away in a duttery-looking mass. The result of this activity was so extremely unpleasant that I was glad to seek the aid of mother earth, the great deodorizer, and to bury my experiment in the ground.

These little intruders appear before us in many domestic and questionable shapes. For instance, when the milk turns blue and sour, or when the milk turns red instead of blue. Even bread is known to turn red under their influence, and Dr. Prudden of New York in his charming little book describes the terror of a hoarding-house cook, who, on going to her ladder, found her sausages all turned red; "a fiery effigy which seemed to her more like the quondam spirits of their mysterious ingredients than the noxious, homely friend of the homeless hoarder." This phenomenon is due to the same species as that which brings about the miracle of the bleeding host, by turning the water red, and it also causes rain to turn red under certain favorable conditions. It is now cultivated in the laboratory, where it can be seen leaping from the culture media in small droplets like blood.—*Nineteenth Century*.

CURIOUS EFFECT OF ELECTRICITY.—We often read that after severe tornadoes, a strong electrical character, chickens have been found completely stripped of feathers, while at the same time the fowls are often not seriously injured otherwise. The question is how were the feathers removed—by the wind?—that would seem to be impossible. An explanation of the phenomenon has recently been suggested as follows: Place a man or a woman on an insulated stool so that the electricity will not pass through the body to the earth, and then heavily charge the body with electricity and every hair of the head, even a woman's long hair, will stand out like iron spikes or the elzed hair of the Circassian show girl. No doubt, remarks the *Forth Worth Gazette*, if the electric charge should be increased it would drive every hair out of the head, and this may be the reason that so many chickens are stripped by tornadoes.

A NEW TYPEWRITER.—A Battle Creek (Mich.) man has patented a typewriter for musical composers. The copy which it makes can be photographed and a plate reproduced for printing, which is said to be much better than plates made in the ordinary way.

CONCENTRATED OXYGEN.—Nitrate of potash (saltpeter) is said to hold in one volume as much oxygen as 3000 volumes of ordinary atmospheric air. Hence it has been called "a magazine of oxygen in a solidified form."

GOOD HEALTH.

Death Rate of the State.

The monthly report of the State Board of Health shows that in 66 cities, towns, etc., aggregating a population of 695,866, there were 1096 deaths during the month of July. There were 141 deaths due to consumption, 45 to pneumonia, 12 to hrouchitis, 5 to congestion of the lungs, 16 to diarrhoea and dysentery, 62 to cholera infantum, 89 to other diseases of the stomach and bowels, 34 to diphtheria, 10 to croup, 38 to typhoid fever, 45 to cancer, 80 to heart diseases, 12 to alcoholism and 507 to other causes. The percentage is 1.57 to 1000.

Cancer.

We would call special attention to the rapidly increasing proportion in this city of deaths from cancer. Forty-five deaths in one month is a fearful loss from this dreadful malady. The loss from diphtheria was only 34, and yet our Board of Health has seen fit to issue a special bulletin in regard to its cause and cure, which is well and good; but how about the far more dreadful malady to which we have referred? Would it not be well for the Board to look into that matter a little also? It has been repeatedly asserted that cancer, in its worst form, is being constantly cured in this city, not by the harsh and barbarous means of the knife and plaster, but by purely constitutional treatment—so mild that absolutely no suffering whatever is imposed upon the patient. There are scores of people in San Francisco who have been so cured after the regular faculty had given them over as past all hope. Now, would it not be well for our City or State Board of Health to inquire into this matter also, and denounce the claim or imposition if it be such; or if it should prove a reality, make known that fact and thus bring the good news to ears of the 400 or 500 cancer patients now suffering in this city without hope of relief. The treatment can be witnessed by any one—professional or not—every day in this city, and the Board of Health knows where, and can easily satisfy itself in regard to its truth or falsity by a little careful inquiry. We can assure them that steps will be immediately taken to give the remedy to the world as soon as the faculty will take the trouble to ascertain the truth of the matter, if their verdict should be favorable. The proof of its reality is already abundant, and additional evidence can be obtained in any way and manner that wisdom may point out. Can our city officials or the Executive of the State, even, find a more important subject of inquiry? Is not the indifference of the City Board of Health to this matter a neglect of official duty, and one which might with propriety be brought to the attention of the present grand jury, which is expected to take a very broad view in looking into everything pertaining to the health, morals and general well-being of our city?

Fatal Effects of Pickles and Vinegar.

The following, which we clip from an exchange, is worthy of the most careful consideration of all housewives, mothers and our numerous pickle-loving readers:

"We have known for a long time that vinegar was a bad thing; a medical writer says that even when it is used in tolerable moderation it causes 'intestinal irregularity, constipation, diarrhoea, flatulence, cough, watery eyes, etc.," and that persons with feeble digestive organs had better do without it.

"A friend of ours knew a young lady who was troubled with an excess of fat, but otherwise was in good health. Some one advised her to take vinegar, which would reduce adipose. She did so, and was delighted with the result. The fat rapidly disappeared; but, unfortunately, the process did not stop there; the girl continued to waste away, losing tissue rapidly, until she was almost a skeleton. Then tuberculosis set in, with disorganization of the lung tissue, and in the space of three months she was a hopeless consumptive. The disease progressed rapidly, and the grave soon claimed its own.

"It is said that pale, anemic girls are fond of pickles. The girls that are in the habit of eating pickles are apt to fall into a decline, and the first thing their friends know the case is past remedy. The strong acid, with the pungent peppers, etc., that are in the pickles, break down the digestive organs and cause emaciation. The blood, too, becomes deteriorated in quality and a diseased condition is the result. Why do people persist in eating things that are not only absolutely worthless in point of nutrition, but positively injurious to health?"

Eating.

Most people eat too much and too often. Frequent eating keeps the food constantly passing into the digestive tract, and, little by little, it is strewn along the alimentary canal, and when the bowels move, if they move at all, there is but little passes away at a time; whereas, if the same amount of food had been eaten at the proper times, the bowels would have the proper amount of debris to stimulate them into healthy action, and there would be no constipation. Again, this frequent eating keeps up a physiological congestion which in time passes into a chronic congestion, and the

person becomes sore on pressure throughout the region of stomach and abdomen.

When the individual is eating a little every hour or two, we find at the end of the 24 hours an excess has been taken of the needs of the organism. This excess is liable to be converted into fat, or, of certain kinds of food, into biliousness. Should the system at last be able to take on no more fat, it is retained in the blood and the blood vessels are distended thereby. This is thrown off by fits of sickness which we call colds, but which are nothing more or less than catarrh. This too fatty condition of the system is liable to cause pneumonia and consumption; the work of the heart is increased, and finally becomes difficult, causing a congested and inflamed condition of the lungs. The kidneys and liver enlarge from the extra amount of work they are called upon to perform, and later the surplusage passes to the muscles and joints, until the person becomes stiff, heavy and sore.

We invite all to come to the Retreat, where they may become better able to understand how to eat, what to eat, and learn the many evils people bring on themselves by eating too much. It is our constant aim to teach the truth on these things, and show how we fail, as did our parents in the garden of Eden. Let all who wish to know more take the *Health Journal*, and come here, where we will make them welcome, and where they can store their minds with useful knowledge. They may thus prove a blessing to those whom they may thereafter be associated with.—*Health Journal*.

USEFUL INFORMATION.

IS THE DIAMOND OF METEORIC ORIGIN?—Investigations made some 15 years ago tended to support the conviction that the diamond might be of cosmic origin. Later, in the year 1887, an English mining expert contributed to current literature some notes in which he showed that the motherstone of the diamonds in South Africa bore a remarkable resemblance to certain meteorites, of which he had had the opportunity of making a close examination. Finally, in a black meteoric stone which fell at Nowy Uraz, Russia, and a piece of which is preserved in the Vienna Natural History Museum, there were found small crystal diamonds representing one per cent of the size of the stone. But the really useful commercial diamond is only found in a zone running through Southern Asia, South Africa and South America, where the conditions of the surrounding earth often seem to confirm the aerolite theory. In South Africa the majority of the diamonds are found at a good depth below the surface, and the burnt track of the meteorite may frequently be traced in the soft soil. On the other hand, particularly in Brazil, mines are heard of which have become completely exhausted after a short working, pointing to the probable circumstance that the diamond-carrying meteors have, in this case, been of comparatively small size, or have fallen upon extremely hard rocks, on which they have at once been dashed to pieces.

OUR MANUFACTURES.—Although the census reports relating to manufactures have not yet been published, they have been sufficiently completed to warrant an estimate and furnish some very interesting facts for our consideration. According to the estimate as made by Superintendent Porter of the Census Bureau, the capital invested in manufacturing enterprises has doubled in 20 years, and the amount thus employed is put at \$4,600,000,000. The value of products from the employment of this vast amount of capital is put at \$5,600,000,000; an increase of about 60 per cent over the figures for 1880. The amount of wages paid has increased at the rate of \$50,000,000 annually, and now amount to about \$1,500,000,000, and the number of wage earners has increased about 900,000 in the decade. These figures make a showing which is hardly to be comprehended, but they represent an industrial progress which is unprecedented in the world's history, and leaves little for croakers to growl over.

PIO IRON FROM BOSTON TO LIVERPOOL.—An event of unusual interest, and one which may result in something of a revolution in transportation interests, recently occurred in Boston, when a contract was made by the Warren line of steamers for the transportation of a large amount of pig iron from that city to Liverpool. This is the first contract of the kind recorded, and the result will be watched with interest, as, in case it proves successful, as it undoubtedly will, it will materially assist in building up our shipping interests. An exchange says this seems like carrying coals to Newcastle, but it may be the beginning of a revolution in transportation interests.

TO TEST SEWER OR DRAIN PIPE.—A unapert joint in a sewer or drain pipe may be tested by wrapping it with a single layer of white muslin, moistened with a solution of acetate of lead. As the gas escapes through the meshes of the cloth, it will be blackened by the sulphur compound.

A SAFETY MINE ELEVATOR.—An English mining engineer has invented an ingenious device to prevent accidents in the case of the breakage of an elevator rope. In the center of the winding rope is a copper wire which carries a current of electricity to electro-magnets

which hold back grips pulling against springs. The current is broken by the fracture of the rope, the grips are released, and by the action of the springs they come in contact with the guides. The advantage of this method of securing safety over the ordinary mechanical catches is that they do not come into play by the slackening of the rope.

THE BUILDER.

Building Statistics.

Some interesting conclusions are to be drawn from the statistics of building in the principal cities of the United States during the last year, as shown in the records of the building departments for the cities in question. As usual, Philadelphia is far in advance of all other cities in regard to the number of buildings erected, while New York comes second in point of number. The average cost of the Philadelphia buildings in 1890 was, however, but little over \$2000, while the average in New York was nearly \$12,000. Boston came next to New York in the amount of money spent in building, having erected 4400 buildings, at a cost of over \$32,000,000. Curiously enough, Minneapolis erected almost exactly as many buildings as Boston, but at a total cost of about \$2000 apiece. Washington built 4048 houses for \$1500 each; while Cleveland built 4007, at an average cost of less than \$1100, this being the lowest average cost reported anywhere.

As might be expected, the average cost of building in Chicago is now very high, the city standing next to Brooklyn in this respect. New Orleans builds a cheap house, the average cost being about \$1400, but it is to be remembered that the climate of Louisiana is very mild, and that the ordinary house has no cellar, and almost no foundation. The table shows some other curious facts, which are not so easily explained, if, indeed, there is not some error in reporting them. Thus Charleston, S. C., built in 1889 only 225 houses, which cost less than \$295,000. Duluth, in the same time, built 240 houses, which cost very nearly \$2,500,000, or more than \$10,000 apiece. This is the highest average cost reported from any place except New York, but there may be a typographical error in the table. That the Charleston houses should average only \$1300 apiece is natural enough, the climate being nearly as mild as that of New Orleans, but that the number of new buildings and the total cost should be far below that of some obscure Northern villages, such as Waltham, in Massachusetts, which, although it has no building department to keep a record, is said to have built more than 300 houses in 1889, at a cost probably of nearly a million dollars, gives a sad idea of the state of stagnation of the proud South Carolina city. Savannah, the rival of Charleston, made no report at all, and we have no statistics from the newer southern towns, such as Atlanta, Birmingham, Asheville, Chattanooga, St. Augustine or the other places which are just now most talked about.—*American Architect*.

ADVANTAGES OF LOW CEILINGS.—"Rooms with low ceilings, or with ceilings even with the window tops," says the *Popular Science Monthly*, "are more readily and completely ventilated than those with high ceilings. The leakage of air, which is always going on, keeps all parts of the air in motion in such rooms, whereas if the ceiling is higher, only the lower part of the air is moved, and an inverted lake of foul and hot air is left floating in the space above the window tops. To have the currents of fresh air circulating only in the lower parts of the room, while the upper portion of the air is left unaffected, is really the worst way of ventilating, for the stagnant atmospheric lake under the ceiling, although motionless, keeps actively at work, under the law of the diffusion of gases, fouling the fresh currents circulating beneath it. With low ceilings and high windows, no such accumulation of air is possible, for the whole height of the room is swept by the currents, as the dust of the floor is swept by the broom. Low ceilings have also the advantage of enabling the rooms to be warmed with less expenditure of heat and less cost of fuel. The above does not agree with the generally accepted idea of the height of rooms in dwellings, but the authority is good and well worthy of consideration by persons about to build."

NEW BUILDING MATERIALS.—A patent has been granted for a process of manufacturing boards, slabs or plates, chiefly applicable to the usual building purposes of wall and ceiling lining or covering and also as a lining for ice-berths, floors and the like. Each board or plate is composed of the following materials: A large number of small tubes, either especially made of paper or other suitable material or formed of vegetable stalks. These tubes are uniformly distributed, so as to form a number of cores for the semi-liquid mass which is subsequently cast in. A plastic mass consisting of plastic mineral matter, such as burned gypsum, cement or lime, and finely divided particles of organic origin, such as small oaks, wool, hair or feathers, with or without the addition of a liquid binding substance, such as glue, water or a mixture of water with alum, green vitriol and soluble glass in the following relative quantities: Gypsum, cement or lime, 50 parts; small oaks, 10 parts; wool, hair or feathers, 1 part; binding substance, consisting of alum, vitriol and soluble glass, 1 part.

ELECTRICITY.

Electric Roads in and About San Francisco.

The remarkable success which has attended the operating of the cable roads in this city, the city of their birth, has had much to do in keeping in the background roads operated by electricity, but it appears that we are now just upon the eve of a revolution in this regard. The success of the Oakland & Berkeley electric road, and the demonstrated value of the electric system of operating street roads in Eastern cities, has determined some of our San Francisco capitalists to adopt the electric system in this city.

The San Mateo electric road will be the first to go into operation on this side of the bay. The first section of that road, with the outside cemerlees as its temporary terminus, is nearly completed. The contracts for the power house have been let, and work will be commenced in a few days. The house will cost \$31,000, and the concrete bed on which the engine will rest \$8000. The Ralston Iron Works will put in the machinery, and a large force will be put on at once. It is thought that the entire plant will be completed within 60 days.

The North Beach & Mission road, it is expected, will soon wake from its Rip Van Winkle sleep and take on a current of electricity to place itself in the van of our city roads. A meeting will be held on Sept. 23d to consider the matter definitely. Our enterprising citizen, Geo. W. McNear, has recently bought an extensive block of this stock, and freely expressed his ardent desire for the new departure. Horace, however, will probably be continued on the branch from California street to North Beach.

Col. Fred Crocker, who ought to know something of the economic value of the cable system, says he hopes soon to see a second electric road to Berkeley running out on Broadway, Telegraph and Humboldt avenues.

In addition to the above, franchises have been granted in Oakland for electric roads, as follows:

- One from Washington street down 12th to 16th street station.
- One from Oakland to Haywards direct.
- One to pass along 17th street from Broadway to 16th street station.
- One along 8th street from East Oakland to Broadway, Oakland, and along 8th to 16th streets.
- One from Broadway over 8th street bridge to 6th avenue, East Oakland.

The electric road has evidently come to California to stay.

Electricity in Mining.

Few, if any progressive mine operators, says *Engineering News*, now doubt the adaptability of electricity to all manner of mining operations, or the facility with which it can be led into intricate underground workings, as compared with any system of piling. The one doubtful, and a most important point is whether or not it can be used with safety under the conditions present in an average coal mine operated by men unskilled in the use of electricity. The Messrs. Atkinson think all danger can be avoided, and back their statement by an experience of four years with this particular class of machinery. Though Sir John Cook, president of the Institute of Civil Engineers, in a paper read before that body, hoped that the question of the safety of electric power in coal mines, as compared with other methods of conveying power, should occupy a prominent part in the discussion of his paper, no one speaker, in the very voluminous discussion that followed, denied that, with a motor protected and reasonable precautions taken in ventilation, there was little or no danger to be apprehended from the use of electricity.

The bulk of the discussion turned on the relative economy of electricity vs. compressed air rather than upon the question of their relative safety. As far as this discussion treated of the subject, electricity seemed to have the heat of the argument on the score of economy in power and less loss in transmission. But it is also evident that the introduction of the new power into the market was having the effect of making manufacturers of compressing machinery study more closely the working of their own machines.

There is no doubt that air-compressors can be still further improved, great as has been the progress in late years. In the Popp experiments in Paris, the absence of perfect cooling of the compressed air resulted in a loss of 40 per cent of the gross power, and Mr. Howard D. Pearsall claimed that if he could eliminate this loss, all other losses would amount to only 33 per cent, leaving 67 per cent net efficiency. Again, for use in motors, there is great advantage in heating and expanding the air before it enters the cylinder; and while this has been done by Mr. Frederick Hurd in a mine motor, and by Mr. Mekarak in his tramway engine, both systems can be and doubtless will be improved upon and made more valuable commercially. In fact, in mining operations, as in other fields, the electric motor is there to stay, and the appearance of this new power will have the usual stimulating effect upon any rival power that has hitherto held the field undisputed, and we may expect advance in old methods to meet the new conditions.

TABLE OF CONTENTS.

ILLUSTRATIONS.—120-Horse Power Dynamo for Electric Power Transmission; Wood's Water-Tube Safety Steam Boiler, 129. Joseph Le Conte, 137.
EDITORIALS.—Long Distance Electric Power Transmission; Children in Mines, 129. Passing Events; Gold in Australian Colonies; A Mining Electric Power Station in California; Good Roads; Recent Mineral Discoveries; Recent Applications of Electricity; California and Oregon Coal; Important to Advertisers, 136. Wood's Water-Tube Boiler; The New President of the American Association; Government Jetties at Eureka; Employers and Manufacturers Organized; Miscellaneous, 137.
CORRESPONDENCE.—Mines of El Dorado County; Ophir, Placer County, 130.
MISCELLANEOUS.—Feather River Gold; Country Roads and City Streets, 130. Hite's Cove; Items, 131.
MECHANICAL PROGRESS.—Manganese Steel; The Catlin Rapid-Firing Gun; A New Alloy; A Novel House Stove; An Ancient Boiler; Pulleys; Massive Box Girders; The Cushion Car Wheels; Imaginary Defects; Shafing; Large Cranes; Miscellaneous, 134.
SCIENTIFIC PROGRESS.—Mountain Storms, Cloud-Bursts, Etc.; Do Clothes Make a Boy? Mold on Jam—An Interesting Study; Curious Effect of Electricity; A New Typewriter; Concentrated Oxygen, 134.
GOOD HEALTH.—Death Rate of the State; Fatal Effects of Pickles and Vinegar; Eating, 135.
USEFUL INFORMATION.—Is the Diamond of Meteoric Origin? Our Manufacturers; Pig Iron from Boston to Liverpool; Do Test Sewer or Drain Pipe; A Safety Mine Elevator, 136.
THE BUILDER.—Building Statistics; Advantages of Low Ceilings; New Building Materials, 135.
ELECTRICITY.—Electric Roads in and About San Francisco; Electricity in Mining, 135.
MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 132-133.
MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 140.
MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 140.

Passing Events.

The new mines near Carson, Nev., and near Ogden, Utah, are attracting many prospectors to those regions. In both cases, the indications appear to be pretty good and point to permanent camps.

The famous Allison Ranch mine, on Wolf creek, south of Grass Valley, Nevada Co., has at last been bonded in the sum of \$70,000. This mine was discovered in 1851 and worked until 1867. It was very rich, but a hard mine to work, being very wet. The wonder is the mine has been left idle so long, in view of the great quantity of gold it turned out in its palmy days. From the small vein, over \$2,300,000 was taken out.

An important meeting of employers was held this week to perfect an organization to promote the manufacturing interests of the Pacific Coast by resisting unjust demands of trades unions. The leading firms in almost every branch of industry have joined the association.

In another column is a statement of the establishment of a central electrical power station for mining purposes, designed to furnish power to a number of mines in a district. This is an important move, and one which will doubtless be followed on other parts of the coast.

Gold in Australian Colonies.

Last year Queensland yielded 600,000 ounces of gold; Victoria, 588,560 ounces; New Zealand, 193,193; New South Wales, 137,480; West Australia, 22,806; Tasmania, 20,510; and South Australia, 15,000 ounces. The report of the Mines Department of Victoria shows a falling off in that colony of over 26,277 ounces. The Victorian product of gold for 1890 was 588,560 ounces, or 26,277 ounces less than 1889. The decrease is chiefly due to the falling off in alluvial yields, which amounted to 206,159 ounces, while 382,401 ounces came from quartz. Beechworth and Ararat are the only districts of the seven mining divisions that show an increased yield. Since the commencement of mining to the end of 1890, Victoria has put out 56,870,574 ounces, valued at £227,482,296. The Madame Berry mine still holds first place with a yield of 31,293 ounces for the year, the Berry Consols coming next with 22,302 ounces. The dividends amounted to £504,476, or £22,273 less than 1889. At the end of the year 23,712 men were employed gold mining, 335 less than in the previous year. There were 3164 Chinese at work. Other minerals employed 597 men.

The report indicates that the obtaining of gold in large quantities is daily becoming more difficult. The alluvial deposits of moderate depth have been pretty well worked out, as in California, but there are still large tracts where deep leads may be found. The Secretary for Mines advocates the use of diamond drills and expects to find these deep deposits. He suggests, also, that private enterprises should be aided by the Government in the search for deep leads.

A Mining Electric-Power Station in California.

In last week's PRESS, reference was made to a central electric-power station for mining purposes in Australia, by which power is to be furnished to the various mines and mills of two districts. There is in California a station owned by the American River Syndicate, at the mouth of Rock creek, on the South Fork of the American river, El Dorado county. This has been in operation for more than a year, furnishing electric power for the Dalmatia mine, some miles away from the station. In previous numbers of the PRESS, this plant has been described in some detail, and it has been successful from the start.

In calling this week at the shops of the Electrical Engineering Co. of San Francisco, we learned that this company is about to add to the same circuit a 25-horse power Keith motor for the mill of the St. Lawrence mine, over three miles farther away than the Dalmatia mine.

Mr. Pearson, the superintendent of the syndicate, has secured a large water right at the station, and will furnish electric power to the mines within a circle of several miles radius.

This is the same plan as that proposed in Australia, but the El Dorado county plant has been in operation over a year for one mine; now, with increased machinery, power will be furnished from this central station to a number of mines. Doubtless this system will be applied in other places. Mr. Pearson always had the greatest faith in the plan of applying electric power to mining purposes, and it must be gratifying to him to find that its success demands an extension of facilities to other properties.

Good Roads.

We publish on other pages the concluding portion of Mrs. Hoffman's excellent article on "Country Roads and City Streets," which should be read by all interested in this important subject. In this State, the country roads are usually sadly deficient, being muddy in winter and dusty in summer. During the long dry season, the roads get badly out of shape unless occasionally watered, and there are comparatively few sections where this is done. More attention, however, is now being paid to the roads, as there is a better realization of the importance of good ones.

In our cities, where the noisy, rough and unclean cobble-stone pavement has held sway so long, smoother and better roadways are desired and are being put in. We have in this State an advantage over many others, as there

are such extensive deposits of bituminous rock and asphalt. The finest streets are now paved with this material, not only in this and neighboring cities, but in many of the smaller towns of the interior. More attention is being paid to suitable foundation than formerly, and the result is more durable pavements.

Recent Mineral Discoveries.

Both Utah and Nevada are rejoicing in new mineral fields which are attracting the attention of prospectors. The Pine Nut mines, Silver Lake district, Douglas county, Nev., has one rich mine—the Bank of California—and a number of unopened prospects. The country is said to be showing up many new ledges, some of low grade, but all pretty well defined. Wm. Zinn, the mysterious owner of the first discovery, finally permitted others to go into his claim last Saturday, and visitors report it is all he claimed. He is said to have taken out \$1500 in four hours from the decomposed gold quartz. A claim owned by W. H. Stone and Archibald Baker is also said to show up well. Men are still going into the new camp.

The Utah discovery, briefly mentioned last week, is at Bear Gulch, 25 miles northeast of Ogden. The ore runs high in lead, with 12 to 24 ounces of silver per ton. Bear Gulch, which was the original name of the location, is about three-fourths of a mile wide and 13 miles in extent. Mineral has, however, been discovered in all the section around, and in every instance in paying quantities. The whole country for miles shows vast quantities of low-grade galena ore.

Thus far, mineral has been discovered in a scope of country that covers an area of about two to three miles in width. The richest of the mines yet discovered are the Sundown and Sunrise. The lode is galena, and runs through a hill for a distance of over 6000 feet, and along its entire length blossoms of the great vein can be seen. A two-thirds interest in the Sundown mine has been bonded for \$15,000 by Charles S. Warner of Butte (Mont.). The mine was first discovered by a shepherd, and was opened by Pete Wilson and Abe Bolton of Brigham City.

The famous Bullion Block Mining Co. has about 50 men at work on the La Plata mine, from which it is taking out large quantities. The ore is galena.

A town called La Plata has been laid out, and some 1200 people are said to have already gathered in the region, and many more are on the way. There are all sorts of stories, more or less exaggerated, regarding the richness of the ledges. Many persons believe this to be in the same ore belt as Park City, where there are many rich mines. The new district is thought to be one of great extent and permanency.

Recent Applications of Electricity.

Although there are a number of treatises on the subject of electricity, there is a demand for more information, relating especially to the practical part of the science, and this demand is particularly among amateurs and students who want a simple work on the subject. Such a work has just been published by the Buhner Publishing Co., Lynn, Mass. It is called "Electricity and its Recent Applications," by Edward Trevert, author of several other works on electricity. The work is presented on an excellent plan, and is characterized by intelligent treatment; the principles and methods being plainly demonstrated. The book is written up to date and expounds all the latest problems. The author devotes himself with special earnestness to a thorough investigation of all the latest developments, and the language is so simple and expressive that the subjects are brought within the comprehension of all. It is a valuable textbook for beginners in the practical application of electricity in its varied forms to diversified arts and industries. Among other chapters are those on the modern electric railway, electrical mining apparatus, electric welding, electric lighting, motors, dynamos, incandescent lamps, etc. The book has about 350 pages, is well illustrated, and costs \$2. The agents in this city are Osborn & Alexander, 401 Market St. For those who want a simple, readable work on this subject, without mathematical formulae, this is the best we have seen.

Important to Advertisers.

In conversation recently with two different advertising patrons of the MINING AND SCIENTIFIC PRESS, they each (very positively) assured the editor that they received better returns from their advertisements in this paper than from any in which their business notices were inserted. One of these gentlemen advertises an article adapted for the use of steam-users and manufacturers, and the other wants the attention of the mining community. They found that they reached these special classes better through the columns of the MINING AND SCIENTIFIC PRESS than through any other medium. Both of them, moreover, have their advertisements inserted in several papers in this and other Pacific Coast States, but the letters received by them indicated that most of their correspondents had seen the cards in this paper.

In this connection, it may be remarked that the expenses incident to the publication of an illustrated technical paper such as the MINING AND SCIENTIFIC PRESS are much greater than those of ordinary newspapers, and that it is the advertising patronage from which a large share of income is derived, enabling the publishers to furnish first-class literature to their subscribers. Every advertiser in a journal such as this, through his patronage not only brings his goods to the attention of special classes, but assists largely in maintaining the publication to the proper standard.

It is of advantage to them and to the publishers of the paper when those who send inquiries or orders mention the fact that the advertisement was seen in the MINING AND SCIENTIFIC PRESS. In order to reach the special class of readers who are subscribers of this journal, the advertisers give us their patronage, and it is gratifying to know that the PRESS is giving the best results.

California and Oregon Coal.

Census investigations reveal a somewhat unpleasant fact in connection with the coal product of the States of California and Oregon, these two and Michigan being the only States of the Union which show a decrease in production of coal in the past ten years. This fact is still more marked when it is known that the coal production of the whole country has almost doubled in the last decade.

The combined coal product of California and Oregon was 280,155 short tons in 1880, while in 1890 it was only 186,179 tons—a decrease of 93,976 tons. There are only 10 collieries in these two States, employing 443 men. These collieries are only those which ship their product to market by rail or water, the small mines worked for local sales not being included.

The State of Washington has a very different story in the census. The production in 1880 was 145,015 short tons, and in 1890, it was 993,724 tons, an increase of 848,709 tons, the increase alone being about four times the total product of California and Oregon. Washington has 12 collieries in which 1847 men are employed.

Coal is now mined in 29 of the 44 States of the Union. There are 2539 collieries, employing 296,974 men. Taking the ordinary ratio, this shows that about 1,200,000 people are directly dependent on the working of coal mines in this country. The total product of the collieries of this country, in the census year, was 140,747,591 tons, an increase over the previous census year (1880) of 64,411,009 tons.

On this coast there are still large coal fields undeveloped, but the coal is of a comparatively inferior quality. Better coal comes here from Washington and from abroad than is found in California or Oregon, most of ours being lignite or of a character which breaks up on shipment and does not market well except for steam coal.

A COMPANY called the Monarch Cons., has been organized at Pine Nut, Nev., with \$1,000,000 capital stock. This is one of the new mines in Silver Lake district, Pine Nut, Douglas Co., Nev. The trustees are T. E. Roper, A. M. Ardens, Wm. Woodburn, James A. Raycraft and J. R. Judge.

JOHN ZARO, a miner, after blasting Saturday in the Hector gold mine, Sutter creek, Amador Co., was working the loose rock out with a crowbar when a piece above him fell, striking him on the head, killing him instantly. The deceased was 23 years old and a native of Austria.

Wood's Water-Tube Boiler.

The boiler illustrated on page 129 is a radical departure from the ordinary type of tubular boiler, and has several decided improvements. The boiler is constructed, as will be seen by an inspection of the cut, of two end tube cylinders, varying in diameter according to the power of the boiler required, but in no case to exceed three feet long, which leaves ample room for a man to work in, and with all the facilities provided in an ordinary cylinder boiler. The end plates of the cylinders are flanged and single riveted. The outer end plates are dished, that is, made convex, to give them additional strength, the inner plates being stayed by the tubes. In the centre, and on the outside plate of each cylinder, a manhole—as shown—is provided; which permits easy access to all the tubes, for the purpose of cleaning or repairs.

The inner or tube plate consists of a circular flanged plate, five-eighths of an inch in thickness, in which there are a number of holes drilled in a staggered form. The back cylinder and tube end is an exact duplicate of the front, and the two are connected together by a number of 4 to 4½ inch tubes. These are all expanded and beaded over on the inside of each tube-head. At certain spaces there are 1½ inch stay rods passing through the tubes and riveted to the outer or dished head by means of wrought-iron crow-foot ends. These act as braces or stays, while each tube acts in the same capacity, and each tube being of greater strength than the stay rods, although the pressure on the tube sheets almost equalizes the pressure on the outside or dished ends. Hence it will be seen there is an additional amount of strength over any pressure desirable to carry. The shells of these tube cylinders are made of best plates full three-eighths of an inch thick and double riveted, and each connected on the top to a steam drum of sufficient size by a 16-inch neck, double riveted at their flanges and made of best plates, even-sixteenths of an inch thick. These necks are capable of allowing a perfect and constant circulation. The drum being 30 to 36 inches in diameter, and about two feet longer than the boiler, ample storage-room for water and steam is provided. The drum also being accessible at the front end by means of a man-hole, allows every part to be explored. The boiler is supported either by side brackets riveted to the shell of the tube cylinders or is suspended from the top by means of side columns and girders, or saddles, to yokes riveted to the top of the steam drum directly under the saddle, and thus is entirely free from the brickwork.

In this boiler the cleaning can be done in a few minutes. In other boilers of this type a large number of small caps or plugs have to be removed, thus losing time and causing much annoyance and expense, and often it is found impossible to remove them. The ready access to the tubes afforded by the man-holes insures their full heating surface being always kept available, and there is no loss from the effects of dirt, etc.

Should any repairs need to be done in this boiler, they can be accomplished by any boiler maker or mechanic with the same facility as with an ordinary cylinder boiler. Mr. Wood claims to be able to replace any of the tubes in a much shorter space of time than is required in other tubular boilers.

The boiler is economical in the use of fuel, and if properly fired it should evaporate 11 or 12 pounds of water to one pound of coal. The water being contained in the tubes or tube cylinder, divides it up into many small parts and is consequently subjected to greatest heat of the furnace, so that steam can be raised rapidly in any emergency. The circulation being so perfect, prevents, to a great extent, the accumulation of scale and other deposits over the fire. Being made in a sectional form, a maximum of safety is established. In case one part should rupture, an immediate relief is given to the boiler, thus preventing disastrous explosions. Rix & Birrell, 33-40 Fremont St., this city, are the local agents for this improved steam generator.

COLORADO, known to the world as a great silver producing State, is getting ready to make a great exhibit of gold ores at Chicago.

THE Wellington Collieries, B. C., are reported sold by the Dunsmuirs to an English syndicate, the price named being \$2,500,000.

The New President of the American Association.

Joseph Le Conte, Professor of Geology and Natural History in the University of California, has been elected President of the American Association for the Advancement of Science. This is a decided honor to California, as this association stands at the head of all the scientific societies in the United States, and mere membership is a distinction. When such an association elects a man for its president, it not only does honor to the individual, but to the State in which he resides.

In this case, the compliment is a highly deserved one, as Prof. Le Conte has a standing in the scientific world equal to any man in the country.

Prof. Le Conte was born in Liberty county, Ga., in 1823. He entered Franklin College in 1838, and was graduated in 1841, taking the degree of A. B., receiving the degree of A. M.

four years later from the same institution. In 1845, he was graduated from the College of Physicians and Surgeons in New York City. He practiced medicine in Macon, Ga., until in 1850 he removed to Cambridge, Mass., to complete, under Agassiz, a course of studies, long since commenced, in natural history and geology. Dr. Le Conte remained with Agassiz 18 months, accompanying him in 1851 to the reefs of Florida, which resulted in important discoveries concerning the recency and coral origin of those regions.

After taking the degree of B. S. at the Lawrence Scientific school, Cambridge, he returned to Georgia and was appointed to the chair of natural sciences in Oglethorpe University. He resigned this position after one year to accept the chair of natural history and geology in the University of Georgia, which position he held for four years. In 1857 he was elected to the chair of chemistry and geology in the University of South Carolina. In 1869 he accepted the Professorship of geology and natural history in the University of California, the position he so ably fills at the present time.

Prof. Le Conte has been a frequent contributor to the periodical literature of the country, both literary and scientific. In 1873 he published a volume entitled "Religion and Science," a series of Sunday lectures. He gave to the world his "Elements of Geology" in 1878, and in 1881 published his "Sight, an Exposition of the Principles of Monocular and Binocular Vision," a work which has been accepted as a standard. Prof. Le Conte is a member of all the more important scientific associations of the Union. He is a very pop-

ular man with the students and all who know him. Like most men of great attainments, he is modest and retiring in disposition. Those connected with all branches of science in California will rejoice that the honor of the Presidency of the American Association has fallen to Prof. Le Conte.

Government Jetties at Eureka.

It seems to have been fairly estimated that 20,000 people and a corresponding amount of freight pass over the bar at the mouth of Humboldt bay yearly. All these have been in more or less jeopardy. Mr. Frank S. Chapin writes us that now the Government has driven rows of piles out from each side, laid a temporary railroad track upon them, fitted up a scow to run rock across the bay, and a derrick to elevate the cars of rock upon the track that runs out on the piles. They hauled rock down on the Mad River R. R., ran the cars upon the scow,

and tow them across the bay; run them out on the track, and by tonobing a trigger, dump the load from both sides at once upon a heavy matinee.

They now report 30 feet of water on the bar. It is expected that this will be permanent, and will make Eureka a harbor as safe as it is important. It portends a new era of prosperity when they can build, launch and load first-class vessels.

This is only one of the pieces of engineering work that the Government is engaged in on this coast, improving the harbors. The jetties at San Pedro, the port for Los Angeles, are quite extensive. Those at Oakland harbor are, however, the most complete on this coast, and form the entrance to the harbor proper. Before these jetties were built, and the waters confined in a narrow channel, only light draft vessels could go to the city wharves. Now large vessels may enter, and the current, being confined in a definite channel, maintains the depth gained by dredging, there being no further shoaling. The bar at Humboldt bay, where they are building the jetties, is a very bad one, and its condition has been detrimental to the interests of an important region. With a permanent depth of 30 feet on the bar, its dangers will be practically done away with.

It is stated that the electric motor has now found employment in connection with nearly 300 branches of productive industry.

An important discovery of mica has been made near the mouth of the Porlinga river, South Westland, New Zealand.

Employers and Manufacturers Organize.

A protective organization of employers was formed in this city this week to take united stand against any possible unjust demands of labor unions. The association is to be known as the Board of Manufacturers and Employers of California. The following declaration of principles was adopted after brief discussion:

This association is formed to promote the manufacturing interest of the Pacific Coast. Its policy is not dictated by a spirit of aggression, but it shall be the earnest endeavors of its members to prevent friction and to peacefully settle all disputes that may arise between employer and employed.

We, the members of the association, have no wish to interfere with the indisputable right of labor to organize, and believe that the organization and federation of labor compel the organization and federation of employers of labor, to the end that neither party shall tempt the other to overstep the bounds of right, reason and justice.

We believe that arbitrary spirit shown by the unions in the absence of any effective restraining power, and the frequent strikes and boycotts, which have in consequence prevailed in this community, are dangerous to its industries, and this association of employers is formed to check these growing evils.

We recognize the right of labor to organize in its own defense, and to ameliorate its condition, and we, as employers, will not trespass on that right by refusing employment to any one because belonging to such labor organization, but we reserve to ourselves the right to decide whom we shall or whom we shall not employ.

The Constitution, which was also adopted, provides that the association shall be composed of firms, corporations and individual employers of this State, approved by the Board of Directors after October 1st. No member shall be permitted to withdraw without having given 60 days notice. The monthly dues shall be \$2.50, and the association shall meet whenever called by the Directors.

Concerning strikes and boycotts, the Constitution contains the following article:

WHEREAS, Strikes and boycotts are inimical to the best interest of both employer and employee; and whereas, this association is desirous of exhausting all amicable means of ending or preventing strikes or boycotts before resorting to coercion; it is hereby provided,

That in case of a strike or boycott in any of the different trades represented in the association, which cannot be settled by the trade involved in such difficulty, it shall be the duty of the Board of Directors to investigate the trouble, act as an arbitration committee, or recommend such means or take such steps to end the strike or boycott as it may deem advisable or necessary.

A Board of Directors was selected as follows: E. M. Herrick, G. Nickselsburg, Oscar Lewis, Al Rollins, James R. Carriok, W. N. Miller, Albert Darnham, George H. Fuller, J. B. Stetson and Henry Bingham.

DEATH OF A VISCONTESSE.—Last week the funeral of Viscontesse Aletto H. de la Cornillere, widow of the Viscount Charles Marie Earnest de la Cornillere of Pons, France, took place in Oakland. The deceased was born at Cape Town, Africa, about 1840, and married her husband there, where he was a political exile from his native land. He was a man of scholarly attainments and occupied the position of professor of languages in two universities of Cape Town. After the decease of her husband the lady found herself dependent upon her own resources for support. For some time she was employed in this office as was also her daughter. The deceased leaves two children, a son Henry Gaston Earnest de la Cornillere, aged 18, and a daughter, Catherine Olympe de la Cornillere, aged 16. There are no other relatives in this country. The Count de la Cornillere, father of the viscount, died in France about four years ago.

In Victoria, Australia, from 1874 to 1890, an average of one man per week has been killed by mining accidents, the greater percentage being due to falls of earth. Besides this, 116 men per annum have received severe injuries in mines.

PARTIDGE's free magic lantern exhibition is a deservedly popular one in the Mechanics' Fair. The pictures are fairly instructive. His 20 minute lectures and series of exhibits are valuable for the information and rest afforded at the same time in viewing them.

THE returns from eight gold-dredging and sluicing companies in Otago, N. Z., one week in last month were 367 ounces of gold. We have not been successful in river dredging for gold in this country.

MRS. GERTIE DE FORCE CLUFF, of Lodi, is the patentee of garment fastener that is attracting attention at the Mechanics' Fair.

Two New Books on Steam Engineering.
By Emory Edwards.

JUST READY.

The American Marine Engineer.

Theoretical and Practical, with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By EMORY EDWARDS, Marine Engineer. Illustrated by 55 engravings. 12mo. 435 pages. Price, \$3.50.
By mail free of postage to any address in the world.

CONTENTS.

Introduction. Chapter I. The Theory of the Steam Engine. II. Expansion of Steam. III. The Efficiency of Steam Jackets. IV. Triple Expansion Marine Engines. V. Cylinder Ratios of Triple Expansion Engines. VI. Calculation of Work Done in a Compound Engine. VII. To find the Horse Power of Simple, Compound and Triple Expansion Engines. VIII. To find the Mean Pressure. IX. Slide Valves. X. Proportioning Ports and Slide Valves. XI. Link Motion Valve Gear. XII. Valve Motion Diagram. XIII. How to Set a Slide Valve. XIV. Engine Construction Details. XV. United States Government, General Rules and Regulations for Steam (Marine) Boilers. XVI. Burning of Fuel. XVII. Forms of Steam Boilers. XVIII. Modern Marine Boilers. XIX. Riveted Seams. XX. Forced Draft. XXI. Water Tube Marine Boilers. XXII. Repairs at Sea, and How to Make Them. XXIII. Taking Care of an Engine. XXIV. Valuable Information. XXV. Steam Yachts and Launches. XXVI. Modern American Marine Engines and Boilers. Bureau of Steam Engineering, U. S. Navy. XXVII. Triple Expansion Screw Engines and Boilers of the U. S. S. Philadelphia. An illustrated circular of 5 pages, quarto, giving the full table of contents, with specimens of the engravings of this valuable book, will be sent free of postage to any one in any part of the world who will send us his address.

ALSO,

EDWARDS' 600 EXAMINATION QUESTIONS AND ANSWERS, FOR ENGINEERS AND FIREMEN

(Stationary and Marine) who desire to obtain a U. S. Government or State License. By EMORY EDWARDS. Full bound in pocket book form, leather. 130 pages. Price, \$1.50.
By mail free of postage to any address in the world.

Our New Revised Descriptive Catalogue of Practical and Scientific Books, 33 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage, to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO.,
INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,
810 Walnut St., Philadelphia, Pa., U. S. A.

Giant Powder Fuse Cap Fastener.

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for crimping the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, \$2 each, or the entire instrument finished in gold plate, \$5. N. W. MOODY, Fresno, Cal.

QUARTZ SCREENS

A specialty. Round, slot or buried slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAIL ROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1/4 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 46 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINOKLEY, SPIERS & HAYES, Proprietors.

(ESTABLISHED IN 1856.)

Office, 213 Fremont St., San Francisco.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

MINING ENGINEERS.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and office on the Northwest Coast with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories, and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTH'S, ASSAYS AND ANALYSIS OF ORES, WATERS, CHEMICAL SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address Dr. Willis E. Everett Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

A. S. GRANT.

S. B. CONNOR.

CONNOR & GRANT, Millwrights and Engineers

308 CALIFORNIA STREET,
Rooms 80 and 81, SAN FRANCISCO, CAL.

Designers and Constructors of Gold and Silver Mills, Hoisting and Pumping Works, Tramways, and everything pertaining to the Mining and Reduction of Ores.

26TH INDUSTRIAL EXPOSITION

—OF THE—

Mechanics' Institute, 1891,

Opens August 18th; Closes September 26th.

New Features! Special Attractions!

Musical by the First Infantry Regiment Band of Fifty Performers, including JESSIE MILLAR, the Wonderful Young California Cornetist, and the SLIDE TRUMPET QUARTET. In the Art Gallery will be Paintings in oil and water-colors by our well-known local artists, and the great HASELTINE COLLECTION of 190 paintings by the most noted European artists, valued at \$200,000; photography, crayon and pastel work. Also natural products, manufactures and inventions, a grand display of illuminated photographic views three times each evening, 4000 specimens of natural history, magnificent display of tropical plants and flowers, and many other novelties.

Admission.—Double Season Ticket, \$5; Single Season Ticket, \$3; Children's Season Ticket, \$1.50; Adults, Single Admission, 50c; Children, 25c. DAVID KERR, Pres. J. H. CULVER, Sec.

ROPER'S

Practical Handy Books for Engineers & Firemen

By STEPHEN ROPER, Engineer.

The Engineer's Handy Book, containing a full explanation of the Steam Engine Indicator, and its use and advantages to engineers and steam users, with formulae for estimating the power of all classes of Steam Engines. Price. \$3.50
The Young Engineer's Own Book. Containing an Explanation of the Principles and Theories on which the Steam Engine as a Prime Mover is based. Price. \$3.00

Questions and Answers for Engineers. This little book contains all the questions that Engineers will be asked when undergoing an examination. Price, \$3.00
Handbook of Modern Steam Fire Engines. The only book of the kind ever published. Price, \$3.50
Catechism on High Pressure, or Non-Condensing Steam Engines. Price. \$3.00
Care and Management of the Steam Boiler. Price. \$2.00
Handbook of Land and Marine Engines. Price. \$3.50
Handbook of the Locomotive. Price. \$3.50
Use and Abuse of the Steam Boiler. Price. \$2.00
Instructions and Suggestions for Engineers and Firemen. Price. \$2.00

These books embrace all branches of Steam Engineering—Stationary, Locomotive, Fire and Marine. Any Engineer who wishes to be well informed in all the duties of his calling should provide himself with a full set.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of this ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our offices.

ADAMS & CARLISLE FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented Oct. 9, 1888, and Dec., 1890.

ANGELS, CALAVERAS COUNTY, Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir, I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON GARRARD,
Supt. Gold Cliff Mine.

HELENA & IDAHO GOLD MINING CO., SUPERINTENDENT'S OFFICE, GIBBONSVILLE, IDAHO, Oct. 6, 1890.

MR. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting, and the other one is all ready to start. They were so easy to set up and run that I forgot all about the "letter of instructions" until they were set up and running and you recalled to my mind your letter and instructions. Yours truly,
MYRON K. RODGERS, Supt.

ANGELS, CALAVERAS CO., Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours,
T. M. LANE, Supt. Madison Mine.

ANGELS CAMP, July 25, 1891.
MR. JAMES TULLOCK—Dear Sir: We are working sulphurets from mines in Calaveras and Tuolumne Co's. We find the sulphurets saved on your machines cleaner than those saved on any other. Yours truly,
THOS. N. SMITH, Supt. Ulica Chlorination Works.

Price, \$450.

The McIntosh & Seymour Engines.

Engravings on this page represent the McIntosh & Seymour standard single cylinder and standard compound engines. The single cylinder belongs to a type of engines which has become very familiar in recent years and which possesses the advantages of simplicity, concentration of a large amount of power in a very small space, high rotative speed and a closeness of regulation much superior to that of any other class. They are entirely self-contained. Their economy in consumption of steam is good as compared with single cylinder engines of the same size of other types and their cost is moderate. These qualities are peculiarly valuable in an engine for electrical purposes and the immense growth of this industry is responsible for the evolution and large use of this style of engine, although they are well adapted for general manufacturing purposes.

The general design of the engine, as is shown by the cuts, presents no radically novel features except in two vital points, the valve and governor. All other parts are well-known forms, which, by reason of their thoroughly proven reliability and durability, their simplicity and the ease with which they can be kept in proper adjustment, have come to be recognized, in the best engineering practice as standard. They are so arranged as to be easily accessible. All wearing surfaces are large, adjustable for taking up wear, are made of the most suitable materials, and have provisions for thorough lubrication while running, by sight-feed devices. All parts of the governor and the valve seats, as well as the running parts generally, are carefully and intelligently scraped to insure accuracy and proper bearing surface. In doing this, surface and angle plates are used where possible, the valves are ground and shaft is ground and lapped, so as to be per-

fectly true. All finished parts are highly polished. A complete equipment of standard gages and jigs enables the engines to be made strictly interchangeable, so that all parts can be easily duplicated.

The engines are designed throughout with a

liberal reserve strength for emergencies, and the utmost care has been bestowed upon all details, in order to avoid points liable to derangement or excessive wear which may cause annoyance or render repairs necessary. Each engine is subjected to a thorough test.

A number of good features are not shown in the cuts. The frame is made very massive and rigid by heavy internal ribbing. The lower guides are separate pieces, though supported throughout their entire length by the frame. The main bearings have cheek pieces for taking

up horizontal wear. Each one of these is backed up solidly for its entire length by a taper wedge, and can be adjusted by elevating the wedge with screws provided for that purpose. The main caps can be removed entirely without disturbing the cheek pieces or wedges, and the latter can then be removed without disturbing the shaft, exposing over one-half of the circumference of the journal. The crosshead is of the locomotive type, and is made of one piece, including crosshead pin. The latter is flattened off considerably on top and bottom, which avoids any tendency of the pin to wear out of round. The connecting rod has simple strap ends with pin and key. It is believed that this form of rod is the safest and easiest to keep properly adjusted. The governor has a great degree of freedom from disturbing influences and gives a very close regulation. The arrangement of the engine valves is peculiar and the valve seat is so constructed that it can be taken up to compensate for its own wear and that of the valve.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—E.S.

Sierra County Mines.

[From our Traveling Correspondent.]

Forest City.

EDITORS PRESS:—The most remarkable feature of Forest City is the almost entire absence of trees in the town. Just above the town runs the famous Bald Mountain channel which, in the past, has been worked extensively by the old Bald Mountain Co., which worked the channel for a distance of 9000 feet and extracted \$2,500,000 in gold. At this time the Hardscrabble mine is being worked in a small way through a tunnel that enters from the center of Forest City. The principal work at this time is being done by

The Bald Mountain Extension Co.

W. Melkel Supt. The gravel is reached by a tunnel 5480 feet long. The channel is 300 feet in width. About four feet next to the bed, rock is taken out which averages \$3 to the car. The company got into the channel March 23, 1891. Recent work has averaged three ounces of gold a week to the man, or about \$57. The gold brings \$19.25 an ounce in the bar and is 96.272 fine. The company owns 20,000 lineal feet on channel and veins its stock, at this time, at \$1 a share. As there are 60,000 shares, this would make the present valuation \$240,000. When the extent of territory and value of gravel is taken into consideration, this will be found to be a very low estimate. In the gravel of the Bald Mountain, the gold is both heavy and free, the weight running from 21 ounces down, while but little gold is found below the first riffle, and almost none at all in the tailings. This has been due in part to the thorough washing that has been given the gravel before it is allowed to leave the dump-box. The company is about to erect a large hoarding-house, when it will increase its force to 100 men and then expect to take out an average of 200 ounces a week. In the old workings of this company's other channel, over \$500,000 was taken out. The Bald Mountain channel is opened at the Live Yankee mine, Alleghany, and runs there northeast three miles to the present workings of the Bald Mountain Extension.

The Live Yankee was first worked about 1852, and produced over \$3,000,000 in the six years that it was operated. It then lay idle from 1858 to 1872, when the Bald Mountain Co. got in with its tunnel on the extension of the Live Yankee. The Bald Mountain Co. worked about 400 feet on the channel, when the channel forked, the fork going north and the main channel east. The Bald Mountain extension got in on the main channel in 1881, and worked until 1888, when a crosscut channel cut them off. The company then drove the present tunnel, which brought them much nearer the gravel. This, the main channel, is considered the primary placene channel. Unlike most drift gravel mines, the tunnels are driven 24 feet below the channel, and all the gravel taken out as the mine is developed, no pillars being left.

The Ruby Co.

The company (John Colman superintendent) owns three distinct channels—the old Bald Mountain, Secondary Bald Mountain and the Ruby. The company is now putting in a stope to work ground below their tunnel.

Downville.

The Wide Awake, A. Burgan, superintendent, is north of Downville six miles, on Craycroft Hill. The gravel is reached by a tunnel 1000 feet long. The gravel has just been reached, and averages \$2.50 to the car.

At the Excelsior diggings, Fish & Berger owners, a small force of miners is at work on gravel that is good, but no account is kept of the output.

The tunnel on the Telegraph mine is being driven in to tap the channel, and is now in about 2500 feet, with 500 feet to go to cut the old Far Cap channel, that proved exceedingly rich in the early days, but was lost. It is thought that the present channel will strike it. Driving up from Downville to near Sierra City, we find

The Marguerite Mine.

The company (Fred Morria, superintendent) is having the ditch cleared out and is making every preparation to start up the mine.

The mine is opened 400 feet by shaft, and shows a 3½-foot vein of ore. The mine is equipped in the best manner possible, with all the most modern machinery built by the Eulton Iron Works of San Francisco. There are two hoists to go to 1000 feet, a 20-stamp mill, residences, shops and nine miners' houses that admit of the miners messing together. The company owns its water, which has 360 feet pressure at the mine.

Sierra City.

The old works of the Sierra Butte mine (S. Thomas superintendent) are located in Sierra City, and are closed. The ore is exhausted after producing dividends of \$1,400,000.

At this time, the company is working on the center of the Sierra Butte mine, near the apex of the mountain. To handle the rock, a mill has been erected high up on the mountain. The

mill will be used to crush the old pillars of ore left standing in the mine and the surface of the vein.

The Phoenix.

A. C. Bash is superintendent of this mine. It is just below the Buttes, and is opened by a tunnel 790 feet long that cuts the vein 450 feet deep, and here shows a 4½-foot vein. The company has just erected a ten-stamp mill on the mine.

The Wm. Tell, Casper Joos, superintendent, is two miles southeast of Sierra City, and is opened by three tunnels. No. 1 is in 50 feet, No. 2, 307, and No. 3 is now being driven and is in 200 feet. The vein runs from 6 to 12 feet, and averages \$12 a ton. The superintendent intends to continue the lower tunnel, which will tap the vein when in 350 feet, and give over 700 feet of backs. The mine has a small six-stamp mill which will give way to a larger mill, once the mine is sufficiently developed.

Butte Saddle.

The Butte Saddle, T. J. Seitz, superintendent, as its name implies, sits high up and over the buttes at an altitude of 8000 feet, and claims the high distinction of being the highest mine in the State. The property is developed by tunnel No. 1, which is in 100 feet; No. 2, of 800 feet, which cuts the vein 300 feet deep and shows 2½ feet vein. Tunnel No. 3 is started, which, when completed, will give 800 feet of backs. The company will continue its development until next summer, when it will erect a mill.

Mercer and Salinae.

This mine (J. Hutchison, superintendent) is situated six miles southwest of Sierra City, and is opened by one tunnel of 900 feet and one of 600 feet. The vein runs from three to four feet of \$5 ore. The mine is equipped with a ten-stamp mill run by water power.

The Colombo mine, Wm. Penala, superintendent, is 2½ miles west of Sierra City, on the South Fork of the North Yuba river, and is opened by two tunnels, one of 700 feet, that cuts the vein 100 feet deep and shows up a five-foot vein; another tunnel of 1500 feet in length taps the vein 450 feet, and shows six feet of vein that mills \$6 50 a ton. The mine has a 20-stamp mill in active operation.

The Garibaldi

mine, John Sannacco president, is situated 12 miles north of Sierra City in Gold valley. It is opened by a 500-foot tunnel, which shows up a 2-foot vein of \$3 ore. The mine is equipped with five stamps and is being worked under lease at this time.

The Mountain Mine

Is three miles east of Sierra City, and has new 40-stamp mill. The ore was brought down the mountain side by cable and buckets, but the plant could not be made to work satisfactorily, and the property was closed down until some other plan of conveying the ore is arranged. This mine is very well developed by tunnels; No. 1 is 850 feet long, No. 2—500 and No. 3—1200. The vein has an average width of eight feet of quartz of an undetermined value.

The Young America,

John H. Henderson superintendent; is situated near the summit of the Buttes, at an altitude of over 7000 feet and is seven miles north of Sierra City. The mill has the upper Sardine Lake just above, and the lower Sardine Lake immediately below. A more picturesque situation could not be secured, below the green waters of the lake; then the rugged mountain side extending up to the snow capped Buttes make a scene that on a hot summer day is as refreshing as the cool breezes that continually blow across the lakes from the snow topped mountain heights. The mine however does not work its scenery, nor is it included in its assets. The mine is opened by four tunnels; No. 1, or the summit tunnel is 1300 feet long and runs through the mountain top; No. 2 is a crosscut tunnel in 2200 feet; No. 3 is in 1700 feet; No. 4 was driven 2400 feet to cut the vein and then run 1000 feet on the vein which it cuts at a depth of 1600 feet and shows an average width of 10 feet of \$10 ore. The ore is brought by wire tramways and chutes down the mountain side to the 40-stamp mill, which crushes an average of 65 tons a day. The mill is run by a 6-foot Pelton water-wheel.

The average expense of mining and milling has been \$3 a ton. Recently a new ore body has been encountered in Tunnel No. 4 on the west end of the mine. The vein is here 20 feet in width. The ore has not been tested as yet, but the presence of copper, which it shows, is considered a good indication of value in this mine. The mine has produced up to August, 1891, \$1,359,235, and in addition to the cost of the fine and extensive plant with which the mine is equipped, has paid in dividends to the same date \$490,000.

Tunnels.

Sierra is the county of tunnels. This method of mining is here most popular, and is due to the great height of the mountains and their almost perpendicular sides. Sierra has repaid tenfold all who have invested in her gravel and quartz mines, and gives evidence at this time of exceeding in extent and value her past record.

E. H. SCHAEFFLE.

THE Oat mine, in Devil's Gate and Chinatown districts, Nev., has turned out \$24,000 as the result of crushing 400 tons of ore in a five-stamp mill in 27 days.

Hawthorne District, Nevada.

[From Our Traveling Correspondent GANU KENNEDY.]

This district, although but little known, produces a large amount of brilliant and handsome profits.

Your correspondent went through the Lapanta mine, and while there saw some rich ground horned out. This mine was the first discovery of gold in this part of the country. It was located in 1884, and work begun July, 1885. It has produced about \$140,000 and paid \$30,000 in dividends. The ore is free gold and the formation limestone, the ore following and being found under a belt of quartzite interstratified with lime. The ore has been followed about 1600 feet in length, and the deep-work on it is 150 feet perpendicular shaft, at which depth the recent developments show a large body of ore. The ore at present, where crosscut, shows about 14 feet in width, of which, two feet will mill from \$80 to \$100, and the balance from \$15 to \$20.

The outlook is promising for this ore body to prove very large, and it is expected to sink the shaft another 100 feet very soon.

The formation which carries this ore is quite extensive, and it is known to exist for about 1½ miles in length. But little prospecting has been done, and that entirely on the surface, and it is very probable, if the formation was prospected at other points by sinking, that extensive deposits of ore would be uncovered.

Pamlico.

The Pamlico is located ten miles southeast of Hawthorne. It was located in 1885. Active work and development were begun in August, 1887, and prosecuted until November, 1889. During this period the mine produced \$149,000 and paid dividends of \$77,000. The mine was closed down on account of litigation, which has just been decided in favor of the Pamlico M. Co., and work has been resumed within the past three weeks.

The ore is free gold, and the vein is a contact vein, the footwall being quartzite porphyry and the hanging-wall quartzite. Ore has been found all through the vein so far as developed, and continues strong in the lower workings. In some instances, as high as \$10,000 has been taken out in one sack.

Central.

The Central lies about midway between the Lapanta and Pamlico, and has been opened for 2½ years. The vein, which has been followed to a depth of 150 feet on the incline, is from 18 inches to two feet wide, the ore carrying lead, 25 per cent; gold, \$30 to \$35, and silver, 40 ounces. About 20 tons per month are shipped with four men. There is quite a large area of ground adjoining this claim, which is entirely unprospected, which, if opened up, would probably yield as well as this, as for 3000 feet in length and about 1200 feet in width the country is filled with quartz veins from six inches to two feet wide, and all carrying this same ore to a greater or less extent. The formation is porphyry, the veins running north and south and pitching eastward at an angle of about 45°.

Adjoining the Central are claims known as the New York, Hartford, Mingo and Beeson, all of which have produced more or less ore, but none of which have been more than scratched on the surface.

Between the Pamlico and Central there lies another group of claims, comprising the Mountain King, Nevada, Ohio and Mids. In these claims, the ledges are very large, being as high as eight and ten feet in width of solid quartz, the formation inclosing them being quartzite. The ore is lead, silver and gold, and runs as high as 300 ounces in silver, 65 per cent lead and 150 in gold. The ore occurs in deposits, some being quite extensive and others small; but as no system of general development has been carried out, but little is known of the veins, except at a few points. The claims in a high hill, the opportunity for development by means of tunnels, is very good. If these claims were properly opened, there is but little question but what they would prove very valuable and large producers of hailion.

Shipments of ore are regularly made from the War Eagle mine. The ore is lead, gold and silver, and the mine is paying very well.

In addition to these mines, there are several locations upon which two or three men are at work, developing the mine and extracting ore. Among them may be mentioned the Capital, Dictator, Gold Bar, Good Hope, Morning Star, Deposit, and Moonlight. The facilities for working in this district are very good; the mines being dry, the ground stands well, requiring but little timber.

The gold ore are mostly crushed at the Kinkead mills. The lead and silver ore are mostly shipped to San Francisco for reduction by the Selby Smelting Co., and Whittier, Fuller & Co. at Melroe.

Copper Belt.

There is a large belt of copper ore in what is known as the Santa Fe and Silver Star districts, the shipping points being Sodaville and Luning. The ore are largely carbonate and copper, but as there are no smelters in operation, nothing but high-grade ore can be extracted, this being shipped upon the Carson river for the purpose of making bluestone. The market is limited to 15 or 20 tons per month; consequently the copper industry, which should be flourishing, lies dormant. Here is an opportunity for an active man with a little capital and a knowledge of the copper business to take hold and develop a large and lucrative industry.

Precipitation of Metals From Hyposulphite Solutions.

[Written for the PRESS by C. H. AARON.]

The paper on the above subject, recently published in these columns, suggests a few remarks, not in disparagement, but in the interest of truth.

If the Russell process has come to stay, with its new methods and new terms, it is a pity that advantage was not taken of the opportunity to introduce the correct name of the chief agent in silver lixiviation. It is as easy to write and say thiosulphate (and this for a short technical term), as hyposulphite; and cuprous thiosulphate (or cuprous thio) seems preferable to "extra solution."

In this, and in previous papers and supplements, the author has acknowledged most of the errors which I indicated in his book on "Lixiviation," and has given me credit for one of those indications, in regard to which he shifts the fault of his mistake on to Russell, because that gentleman did not discover the whole truth, ignoring the circumstance that I had published the facts which invalidated his theory long before the book was published.

I shall now proceed to comment on the various points in the above-mentioned paper, not occupying space by quotations from it to any great extent, because those who have read the paper with the attention which it deserves, will find no difficulty in making the proper applications.

The author adheres to the old view that sodium is replaced by calcium in the lixivium when calcium sulphide is the precipitant. Is this an instance of "parrot-like repetition"? O. Hofmann found that, after three months work, his solution contained no more calcium than was due to its saturation with gypsum. This may have been an exceptional case, yet it would seem that the (anhydrous) sodium sulphate in the ore and that formed by oxidation will prevent total replacement of sodium by calcium in any case.

The statement that a calcium solution is decomposed very much faster than a sodium solution by exposure to air, seems to rest solely on a single experiment by Russell. Would it not be well to verify Russell's results before basing calculations on them?

In regard to the evolution of H₂S, during or after the precipitation, a phenomenon which I never observed, though I admit I never looked for it, I will remark that a very little of that substance is apt to make its presence known; carbon dioxide will cause its evolution from the polysulphide; air contains carbon dioxide. In the vicinity of fire it may contain a good deal, to say nothing of the breath of many workmen in a confined space. Air has constant access to the sulphide and to the lixivium, the latter especially during the stirring. Should not this be taken into consideration?

O. Hofmann has shown that recently made calcium polysulphide contains a good proportion of thiosulphate. I proved the same fact, and, moreover, proved that the proportion was increased by or during continued holding.

The making of CS₂ requires a larger proportion of sulphur than the making of Na₂S₂, but the precipitate always contains a quantity of free sulphur, and if this is recovered by either of the methods which have been proposed by me and by others, the ultimate consumption will not differ greatly, as between good lime and soda, if the lime is properly used. For my part, on the principle of working, like electricity, along the lines of least resistance, I should prefer the sodium compound on account of its more facile preparation—that is, other things being equal; but among the things which may not be equal, I will mention the great liability, to put it mildly, of the sodium sulphide to contain caustic soda, necessitating the use of some means of neutralization. As to the means, Russell uses sulphuric acid, which is not easily obtained in some localities. I have indicated other methods in the MINING AND SCIENTIFIC PRESS of Dec. 22, 1888, and have shown the advantages of anhydrous acid for the purpose.

The experience of O. Hofmann, at the Silver King, in the great increase in volume of his lixiviating solution, must not be taken as a general criterion. It seems to have been exceptional.

In regard to the "Precipitation of calcium by sodium sulphide," I would ask: Is it by the sulphide or by caustic or carbonated sodium in the sulphide solution? In my article in the PRESS before mentioned, I showed that caustic in the sodium sulphide can be removed by an addition of calcium sulphide with precipitation of calcium hydrate, which seems to show that calcium hydrate, or hydroxide, is insoluble in solution of sulphide.

The author seems to deny the formation of lower sulphides than CaS, in the boiling of lime with sulphur in water. Regnault says, in *Cours Elementaire de Chimie*, French edition of 1851, from which I translate: "If the boiling is not sufficiently long continued, and if the liquid be filtered hot, one obtains a yellow solution which deposits, in cooling, orange-colored needle-crystals of bisulphide CaS₂. This sulphide is very slightly soluble in cold water." I have seen the crystals more than once, but did not analyze them.

"Very concentrated solutions of the higher polysulphides" are not essential to "a high coefficient" of precipitation, as has been proved by Russell and by me; yet it may be that a very diluted precipitant will act differently,

owing to a moliscian change caused by dilution. The sulphide solution, as prepared for milling, give what the author terms "a high coefficient."

The fact seems to be, and is if my theory is the true theory (*E. & M. J.*, Dec. 26, 1885), that the normal coefficient for a polysulphide is 360 parts of silver for 100 parts of caustic soda (or an equivalent of lime). That the practical coefficient is reduced to, or nearly to, 180 is due to a secondary reaction, as I have shown, and a practical coefficient above 180, in continuous working, can only result from the loss of a portion of the lixiviating solution containing some of the tetrathionate formed during the precipitation of the silver, which may be prevented, and the whole of the tetrathionate converted to thiosulphate, by what the author terms "overprecipitation" in each operation. Again, there is no room to question the decomposition of a portion, and an increasing proportion of the tetrathionate, simultaneously with the precipitation of metal. It is proved first, by the diminishing coefficient as the operation proceeds; second, by the increasing production of a whitish cloud of free sulphur; and third, by the almost complete conservation of the solution, even though "overprecipitation" be not practiced. But to admit these proofs would be to admit my theory of precipitation, which the author is not yet prepared to do, though confessing his own to have been wrong; he prefers to dismiss the subject as being "of no economical value," though, in fact, the mere theory of the reaction never had any economical value, and the scientific value is as great as it was ever supposed to be. If the high coefficient were practical, that fact would be the only thing having any (immediate) economical value; why then should he have built "an elaborate theory" on it, or why not now continue the investigation in the light of the new fact? Perhaps the author may think the subject worthy his attention in a future paper, or in a second edition of his book.

The paper as a whole does not make out a strong case for sodium sulphide as against calcium sulphide, and in other respects it indicates a change of base, on the part of the author, as to Russell's process. I have a strong suspicion that, however interesting the new reactions discovered by Russell may be, his process, as a whole, will soon be found to be a game that is not worth the candle.

In regard to the tables in the latter part of the paper, I will remark that, if recovery of the free sulphur be practiced, the showing would be much more favorable for calcium sulphide.

THE WAY TO RISE.—"Ten years ago," said a Tennessee machinist, "I had a little machine shop, with four journeymen, and 'Sim' for an apprentice. In the spring rains I took a severe cold, and didn't go out of the house for four months. I worried a good deal, for I expected my little struggling business would go to the wall soon, but most of the time I was too sick to think much of the matter. Finally, when I got so as to get out, I wandered down to the shop. Instead of four journeymen, I found nine, and Sim was busy in the little 7x9 office closing a contract with a rich inventor to build a steam road wagon. It seemed," said this machinist, "that during my sickness Sim had been in consultation with my wife, and that she, with a woman's intuition, had let him go ahead about as he pleased, and his way—with only his three years' experience—had been a better way than mine. He always had money to pay off Saturday night, and there was a little standing to my credit. The old shop had a brighter look than ever before. The windows were clean, and some tons of old junk had gone to my neighbor's foundry in payment for good castings. Sim had ordered a new lathe, fixed up the old engine, lued up the line shaft, and had the floor swept out and the walls whitewashed. Sim and I," concluded the narrator, "are partners now, and the only thing I really miss is the little old shop that he made look homelike."

Heavy Hoisting Engines.

The new type heavy hoisting engine which the Lidgerwood Manufacturing Co. lately placed upon the market has received a flattering reception. Thirteen of them have already been sold in less than a year. The following endorsement from the president of the Vermont Marble Co., Proctor, Vt.—Fletcher D. Proctor, son of the present Secretary of War, is notable:

JULY 31, 1891.

Lidgerwood Manufacturing Co., New York, N. Y.—GENTLEMEN: The two-drum hoisting engine which you sent us last spring is a success, and we do not hesitate to recommend it for what you claim for it. It runs two derricks with one engine hoisting 20-ton blocks without any trouble 152 feet in a minute and a half—this with a steam pressure about 60 pounds, 300 feet away from the engine; and I am satisfied that with a stronger pressure it would hoist this weight in from a minute to a minute and a quarter. The workmanship of the engine and power is perfect, and we can heartily recommend it.

Very truly yours,
VERMONT MARBLE CO.,
(Signed) FLETCHER D. PROCTOR, Pres.

The Gallup (N. M.) coal miners have declared their strike off and gone to work again on the terms offered by the companies.

The Pacific Coast Empire.

The commonwealths of the Pacific Coast constitute an empire which is peculiar in situation, grand in extent and resources, unique in industries and to the spirit of its people. It is true that there are differences in the resources, industries and peoples of the States and Territories of the Pacific slope, but they agree in being far more unlike the other regions of the country, than they are unlike each other and thus have strong mutual resemblances.

As the years progress, we believe these splendid portions of our great domain will become more like each other, a gradual process of assimilation will prevail, and the people be more strongly knit in sympathy and in political and commercial affiliations than they now are. We do not, of course, mean that they will grow more unlike the rest of the United States as they grow more like each other, or that their development will ever make National bonds wearisome, but there will be more of the family feeling and fervor in the slope group of commonwealths, and as family union and harmony are at the basis of human civilization, so will the unification of the Pacific Slope be but an element of strength in the National advancement.

This *sui generis* character of the Pacific slope has never been adequately appreciated east of the Rocky mountains, nor have our different conditions and needs figured properly in the national councils. There is discernible now a change in the Eastern view of the farther West and a truer appreciation of our affairs is there prevailing. This progress in the Eastern mind in our favor will be advanced by a very proper attention, which has been recently given us by the Government. The visit of the President and some of his cabinet has helped us even if it has been held to have something of personal political motives in it. The good accomplished far outweighs any narrow considerations, even if such existed. Another aid to the slope to place itself properly before the public mind of the country is a special government publication by the U. S. Bureau of Statistics, of which we learn through the *New York Tribune*, a journal which is cordial and generous in its allusions to our slope in connection with the facts which it gleams from the government publication. We quote as follows:

"The volume will be read with gratified amazement. It deals with the development of the Pacific Slope, including the States of California, Nevada, Idaho, Oregon and Washington and the Territories of Utah, Arizona and Alaska. It is possible to give here only a vague impression of the wealth of facts and statistics applied in this book, and of the magnificent tribute they bear to American energy. Their story is almost incredible. The lands comprising these States and Territories, exclusive of Alaska, constitute quite a fourth of the total area of the United States. Alaska, acquired by purchase from Russia in 1867 at a cost of \$7,200,000, has already returned in revenue to the Treasury more than its purchase price, and has produced in values to our citizens not less than \$85,000,000.

"This lack of appreciation in regard to the possibilities of our Western empire has marked every controversy attending their acquisition, and the wonder is that we ever succeeded in obtaining so great a dominion. Jefferson was cruelly assailed for the Louisiana purchase. The Mexican cession was bitterly opposed, even after the decision of a great war had made it one of right. Two years were spent in a bitter fight over the Alaskan treaty, the opposition in all these cases holding that the land would never be needed, and that it was utterly worthless anyhow. British Columbia was sacrificed to the foolish outcry, to the great and permanent injury of our interests. The Mexican cession cost us \$30,000,000, or about 12 cents an acre. We have carved from it California, Arizona, Nevada and Utah and parts of New Mexico and Colorado, and from about one-twelfth of the lands denounced as sterile and valueless we have produced \$1,800,000,000 of gold and silver and 20 times as much in cereals, lumber and fruit.

"Of the 625,000,000 acres contained in the Pacific Slope, 369,000,000 constituted Alaska. Of the remainder, much less than one-half has been as yet surveyed, and not more than 40,000,000 acres can be called improved lands. From these, the agricultural results have been obtained, and it will certainly surprise the public to know that in the last five years the total wheat crop alone has been equal to the total product of silver and gold, while in Oregon, which has produced in 21 years \$17,513,787 of precious metals, the wheat product has amounted in value to \$142,653,627; and it must be remembered that these States, excluding Alaska, contain only 2,268,958 people, more than one-half of whom have come in during the last ten years.

"With an annual product of wheat now exceeding in value \$60,000,000, of salmon \$1,800,000, of lumber \$5,000,000, of other cereals than wheat \$20,000,000; with an annual wool clip of 80,000,000 pounds; with farm animals valued at over \$164,000,000; with savings bank deposits amounting to \$167,396,157; with 11,474 miles of railroad, representing an investment of \$542,792,231, and annual earnings of nearly \$65,000,000; with a foreign commerce of more than \$100,000,000 and a permanent tonnage of 357,000 tons registered; with tax-paying property assessed at \$1,652,075,859, and worth,

in fact, fully \$3,000,000,000, it is certainly fair to claim that the Pacific slope is a country of superlative achievement and inexpressible resources."

We have made a long quotation but the statements are so significant to our Pacific slope people that we can not do less. There is, of course, first a deep sense of gratification to those who are making homes on this grand division of the country to have their work and their heritage so well spoken of, but this pleasant sensation will be counted merely a passing variety when the significance of such facts thus proclaimed to the world is considered. Such a country with such wealth produced by so few people and such vast areas untouched!

This will ring in the ears of the world and re-echo in investment, settlement and progress. We believe that some who now live will see a growth of the Pacific slope which all present achievements but dimly foreshadow. Every proclamation of truth will hasten that day, every good enterprise honestly undertaken and carried on hastens it. Thus it becomes a theme for personal congratulation—a field for individual endeavor, a reward for every stroke of honest toil.

The Postal Telegraph Abroad.

Interesting accounts have been received at the Post Office Department, Washington, from Henry George, Jr., a newspaper correspondent now supplying a syndicate of American daily newspapers with letters from England touching the postal telegraph system in that country. He says the charge for telegrams to all parts of the United Kingdom is one cent a word, including the address, the minimum charge being 12 cents for 12 words or less. Ordinary postage stamps are affixed to the messages in payment. A moderate additional charge is made when the addressee lives beyond the limits of the free-delivery. Telegrams can be repeated at half the original cost. The cost of a reply not exceeding 48 words may be prepaid, and a "reply form" is then delivered to the addressee, who can send his reply from any telegraph office within two months. Five figures are counted as one word; in this country the telegraph companies count every figure a word. As a measure of economy where many messages are likely to be sent, an abbreviated or arbitrary address may be registered for five dollars a year. In addition to these direct benefits, the people enjoy very substantial indirect advantages, such as result from a cheaper service for newspapers and news agencies.

The rate for news messages to all parts of the Kingdom is 24 cents for every 100 words transmitted between six p. m. and nine a. m., and during the day it is 24 cents for every 75 words, with the additional charge of four cents per 100, or 75 words, according to the hour, for every duplicate telegraphic communication. A correspondent in London with 300 papers on his list, for instance, pays for sending out a piece of news after six p. m. at an average rate of a fraction over four cents per hundred words. In this way, Mr. George says, the vast bulk of the news telegraphing is done.

The Delaney multiplex is one of a number of American inventions in use in England, by which it is possible to send out six messages over a single wire at one time. The British government pays \$10,000 a year royalty on it. Although it has been in profitable use there five years, it has been steadily reinforced in this country where the companies have no need of inventions that would increase their facilities and reduce their charges. A prodigious amount of work in an incredibly short time, is accomplished in the English postal telegraph system by the Wheatstone automatic process. This is an English invention, transmitting 400 words a minute, and is used in newspaper telegraphic work.

Since the government regulation of the telegraph lines in England, the number of telegraph offices has been increased from 2,488 to 7,600, the rate has been reduced more than one half, and press rates cut down to a fraction over four cents per hundred words; and, more important than all that, the service has been equally and impartially cheap to all. Universal sentiment, according to Mr. George, testifies to the immensely greater convenience and efficiency of the postal telegraph system, and no one would ever think of going back to the old plan of private companies. Mr. George thinks that as good, if not a better, postal telegraph system could be established in the United States. The American letter service is really much cheaper than the English, taking into account the fact that our territory is 30 times larger; and electrical invention, instead of being checked, would be stimulated.

A YOUTH'S INGENUITY.—A boy we know, says the *Cleveland Leader*, had some chickens of which he had made pets. He and his father went to their work early in the morning, and while the rest of the family was away for the summer, it became a question how the chickens were to be fed with proper regularity. The boy was equal to the occasion. He took an alarm clock and fastened it securely to one side of the barn by means of two spikes. Next he hung a bucket of corn to a rafter and connected it with the clock by a stout cord. He wound up the alarm and set it at 4 o'clock. At that hour the alarm went off, wound up the string and tipped over the bucket. And so the chickens were fed by clockwork.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

OSCEOLA CON. M. CO., August 4. Capital Stock, \$100,000. Directors—J. W. Brown, J. Wray, J. Wertheimer and G. Goodman.
GRAY SPRINKLER CO., of California, August 5. Capital Stock, \$100,000. Directors—L. H. Newton, E. H. Marwedel, S. G. Murphy, Arthur Briggs, C. F. Hamilton, Sampson Tams and Barclay Herley.

SAWYER TANNING CO., August 8. Capital Stock, \$100,000. Directors—S. E. Holden, A. W. Norton, E. Manasse, Homer F. Norton and Martha W. Sawyer.

KOHLER & CHASE, August 8. Capital Stock, \$500,000. Directors—Q. A. Chase, Cardelia A. Kohler, Eunice M. Chase, E. C. Chase and Thos. P. Winter.

SWEDISH PUBLISHING CO., August 9. Capital Stock, \$5,000. Directors—F. B. Hulting, F. E. Erickson, A. G. Spencer, A. Allson and J. O. Kerblad.

LANDLORD'S PROTECTIVE AND MERCANTILE AGENCY, Aug. 24. Object, to conduct an agency for the collection of debts and for dealing in real estate. Directors—J. O. Jackson, Wm. Ogston, H. C. Boyd, D. M. Gavigan and A. J. Brunner.

DUMBARTON LAND CO., Aug. 26. Capital stock, \$1,000,000. Directors—Geo. V. Metzger, Philip Zimmerman, Wm. L. Merry, W. W. Montague and Philip Rohrbacher.

WRIGHT, BOWNE & CO., Aug. 26. Capital stock, \$500,000. Directors—W. S. Bowne, M. E. Wright, E. H. Hanton, J. H. Whitman and C. C. Bruce.

N. P. PERINE CONTRACTING & PAVING CO., Capital stock, \$500,000. Directors—N. P. Perine, F. Walker, R. C. Mattingly, Thos. Carter and J. D. Enright.

SAN LEANDRO LAND, WATER & STONE QUARRY CO., Aug. 26. Capital stock, \$250,000. Directors—R. E. Newland, E. H. Barbee, W. D. Smith, D. Hughes and G. F. Dyer.

CLINTON CON. M. CO., Aug. 26. This company has filed in the office of the County Clerk a certificate of the increase of its capital stock from 60,000 shares, at a par value of \$50 per share to 100,000 shares.

The College Woman.

The girl graduate has not carried off all the honors awarded her sex during this commencement season. The middle-aged woman has her day as well.

Mrs. Gertrude Bowen, whose husband, the Rev. William C. Bowen, former president of the Boardtown (N. J.) Female College, died recently, has been appointed president of the college by the Board of Councils.

Mrs. Georgia Kendrick, of Poughkeepsie, N. Y., wife of the late Rev. Dr. Kendrick, has been elected lady principal of Vassar College.

Miss Ella Sahl, Superintendent of Schools at Portland, Oregon, and a graduate of the Wisconsin State University, has accepted the principalship of Downer College, at Fox Lake, Wis., at a salary of \$3,000. Downer College was formerly called the Wisconsin Female College, but the name was changed at the request of Judge Downer, of Milwaukee, who left it property valued at \$70,000. He was president of the board of trustees for many years. Mrs. Downer also left the college a large bequest.

At least two hallowed sermons were preached by women this year—one at Swarthmore College, Pa., by the Dean, Mrs. Elizabeth Powell Bond, the other at the Central Academy of Plainfield, Ind., by Mrs. Mary F. Moon, pastor of the Friends' church at that place. Both institutions are coeducational.

At Syracuse (N. Y.) University, which, as Geneva College, admitted women by the terms of its charter, and graduated a woman in its first-class in 1853, Mrs. Selva A. Lockwood was the orator of the alumni. Her subject was the conservative force of the college and university, with some comments upon university extension. Mrs. Lockwood graduated from this institution 34 years ago.

At the Rookford (Ill.) Seminary, Miss M. A. Jordan of Smith College, delivered an address before the graduates on "The Literary Aspect of the Civil War." At Laselle Seminary, Ansbardale, Mass., Mrs. Abha Gould Woolson delivered a critical address before the Alumnae and friends upon "Women of Dr. Johnson's Time." At Ingham University, Le Roy, N. Y., Rev. Anle F. Eastman, of Canandaigua, gave an address on "Culture."

At Central College, Ky., the degree of A. B. was conferred on three married women: Mrs. Mary N. Root, Mrs. Caroline Y. Douglas and Mrs. E. H. Rutherford. This singular event in a college for men was explained by President Young, who said that formerly daughters of professors had the right to study with the classes and graduate. These ladies of high degree had done so years ago, and it was but tardy justice to grant them their diplomas.—*Woman's Column.*

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of the Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCRIPPS PAXSON Patent Agency (S. P.) from week to week and year to year.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alpine.

AT HIGHLAND LAKES.—Cor. Calaveras Prospect, Aug. 28: The mining excitement of the Highland Lakes continues unabated, and many are the tales that are told of the fabulous rich float ore that has been found in that wonderful region. J. C. Curtis and E. B. Christ have just returned from there after a week's research, and though somewhat noncommittal, have expressed themselves as having met with much encouragement. Geo. Taylor, an old prospector from Arizona, who has been in all the principal mining countries in the United States, started for the Highlands this morning. It is their intention to make a thorough inspection of the region and study the geological make up of that vast mountain wild. The season for prospecting there is short, and consequently work must be ambitiously pursued. From all the reports of former discoveries, there must certainly be one or more good ledges there, though they have never been found or located; the rich float ore leads to the belief of their positive existence, and it is now only a question of good fortune as to who will make the discovery. It is near this place that the remains of an old arrastra were found, presumed to have been worked by Mexicans years ago. The locality being of such a precipitous nature, it is undoubtedly going through a material change annually, and is therefore somewhat puzzling to those concerned.

Amador.

NEW YORK MINE.—Ledge, Aug. 29: It is the intention to put up a large Huntington roller mill on this property—one that embodies vast improvements over those of the same make heretofore erected in the county, and capable of doing much more work. It is claimed that the one to be put on this mine will crush 30 tons per day. The mill for the New York will be shipped from the S. F. foundry this week and will be here the latter part of this, or the beginning of next week. The manufacturers are under engagement to send an expert to run the mill for a month. It is expected to have it running inside of a month.

QUARTZ MOUNTAIN.—This immense deposit of quartz, situated about two miles east of Amador City, has heretofore defied all efforts to work it at a profit. The ore is of very low grade, as far as free gold is concerned. This is conceded on all sides. Its principal value lies in the sulphurets. These are enormously rich, assaying as high as \$800 to \$1000 per ton. They are, however, very fine, and all methods so far tried to catch them in paying quantities have failed. Now an effort is being made to work the old mountain by a process which has for its main object the saving of these fine rich sulphurets. After leaving the concentrators, the tailings from a ten-stamp mill will pass over canvas 120 feet long and 14 feet wide, and after this will run the gamut of a number of settling tanks like those in successful operation at the Gover. The present operations bid fair to make this a paying property. There is nothing in the county to equal the science displayed in the saving of the sulphurets at the Gover, and this process, considerably amplified, is to be applied at Quartz Mountain. If it turns out a success, it will open up one of the biggest mining enterprises in the county, as the supply of quartz is practically inexhaustible.

BELLWEATHER.—The developments in this claim, which is within the Jackson townsite, have taken a decidedly favorable turn of late. In drifting west at the 100-foot level, the ledge has been struck, showing much richer than was expected. The vein has been followed 18 feet. Its full width has not yet been ascertained. Assays from different points yielded from \$24 to \$35 per ton. The average is estimated at \$15 per ton. At the head of the drift the vein shows six feet wide, with neither wall exposed. The indications seem to point that the ore body will open out into vast proportions at an increased depth. Everything now points to this claim as a valuable and permanent mine. Mr. Bright has spent a large sum in opening it so far, and has the satisfaction of knowing that the developments exceed his most sanguine expectations. It is reported that negotiations are in progress for the starting up of the Moore mine, near Jackson. The attachment levied on the Macatto mine at Irish-town was released this week, under instructions from the plaintiff. It is said the debt of \$1500 on account of which the attachment was issued, was contracted under the former ownership of the property.

Calaveras.

INDIAN CREEK.—Calaveras Prospect, Aug. 28: News comes in almost daily now regarding the Wood's mine and its development at Indian Creek. Quartz has been found in abundance, and there is seemingly no scarcity of ore at present. The main tunnel has been upon a large quantity of quartz that can be quickly taken down at any time. It is becoming apparent that that district is upon the verge of another boom. It is now rumored that Hayward & Hohert contemplate the purchase of the old Calaveras mine. If this proves true, and such men and representatives be once interested in a locality, work will not be half done, but well done. How strange is the history of mining in Calaveras. Mining towns that went down to years of dullness have been rehabilitated, revived and raised to glittering orbs in the mining firmament. Indian Creek has seen its mines lay in comparative idleness for years, and just now it seems as though all was born again, and the people are heralding a new era with praise and thanksgiving.

GOOD ROCK.—We were shown some good rock this week from the mine of B. D. Beckley of Salt Spring Valley. We understand that this mine has been leased for a term of three years; to some parties who are to commence extracting ore at once. Mr. Beckley has already sold some of this rock for a good round sum per ton.

El Dorado.

AT GREENWOOD.—Georgetown Gazette, Aug. 28: While at Greenwood last Monday, we were pleased to learn that active work has already commenced to open up and thoroughly develop the famous old North Cedarburg mine, under the management of the New El Dorado G. M. Co. of Oakland, S. A. Moss Supt. Eight men are now at work sinking shaft and opening old tunnel, and it will not be

many weeks before the working force will be increased. We are glad to know Dr. Martin is making a well planned attack to successfully capture the treasure held within the walls of the old Cedarburg, which has so long resisted the attempts of small unorganized and poorly equipped expeditions sent against it.

BEAR CREEK MINES.—The Darling mine, which at present is being worked by a San Francisco company, is located about seven miles southeast of Georgetown, on divide between Bear and Rock creeks. This mine was first discovered by the Wagner Bros. about ten years ago, who located the claim and sunk a shaft about 30 feet deep. It was abandoned by them and afterward relocated by A. Darling & Sons, by whom it has since been worked. Five or six years ago Mr. Darling built a two stamp mill which he run whenever there was sufficient natural water. He has done a great deal of work in sinking and running tunnels, and has always had fair prospects. Last June he bonded his mine to a company who has since erected new hoisting works, and are putting the mine in order to do some extensive prospecting. The shaft is now down over 80 feet, or 40 feet deeper than ever before penetrated. This company intends sinking 200 feet and running levels and crosscuts. So far, everything seems encouraging for a good mine. Two miles south is the Martin & Ambros mine, now bonded to W. S. Lyle. Two tunnels have been run on this claim at different levels, in both of which the ledge prospects well. W. B. Gibbs, who has a contract for running these tunnels, is bringing his work near to completion, so we may soon look for some extensive improvements on this mine. Last, but not least, is the Cook & Wagner mine, about two miles directly west of the Darling mine. This mine was located about three years ago. The owners have sunk a shaft 90 feet deep, and have found flattering prospects all the way down. At present this mine is prospecting better than ever, and the owners think they have the best mine on this divide.

Butte.

TAPPED THE INCLINE.—Cor. Oroville Mercury, August 28: It will no doubt be interesting to many Butte countians to learn that the incline of the old Buchanan Hill mine has at last been tapped and the imprisoned waters let loose. The present owners of this mine Messrs. Solomon and George Williams have been at work for over two years to tap this incline, thereby making a continuous tunnel through the hill from east to west, and had run a distance of nearly a thousand feet. The Messrs. Williams intend to put a flume in their tunnel and expect to wash up tons of rich paying gravel, much of which in the old incline is now in sight. This mine has been worked by various persons for over 30 years and large returns have been realized. The mine, formerly owned by Wm. Merrithew, Mr. Harris and others, was sold some 13 years ago to a S. F. company who put up an engine and pumping outfit, but seemingly found the effort to pump the incline dry a failure or too expensive; abandoned the mine and it fell into the hands of the present owners, the Williams Brothers. About two years ago the Smith Brothers and Henry Curtis leased this mine and took therefrom over \$1500 in a short time. Now that the incline is tapped and presumably the best part of the mine drained and laid open to a better working, there is little doubt but that the owners will reap rich returns for their labors.

Mono.

PATTERSON DISTRICT.—Bridgeport Chronicle-Union: The Rattler has a large amount of good ore piled up on the dump, and considerable rich ore has been sacked for shipment. This mine promises to be a very valuable property. Judge J. C. Murphey is pushing work on the "88" claim, and seems to be greatly encouraged, believing he will have a good mine. John Sheehan has struck a body of rich ore in the Kentuck, formerly well known as the Summers Con., and has taken out ore that will work up into the hundreds. A. P. Sayres is hard at work on his Homestake, and is taking out good ore, which he ships for reduction, and thereby keeps the "wolf" at a goodly distance from his door. He has "a good thing," and is in no hurry to "give it away," but he will be liberal to a live company, as he has adjoining interests, which would be brought to the front by an energetic and intelligent working of the Homestake. The Patterson district is showing up well, and is worthy the attention of mining men. There is much good work being done in the district by close-mouthed prospectors, who seem to be well satisfied with their prospects, but make nothing public.

THE DUNDERBURG.—The new track has been laid in the tunnel, and ore will now be taken out for shipment to San Francisco for a thorough working test of a large quantity. The result of the working will be anxiously looked for by our citizens, who believe the Dunderburg to be a valuable mining property.

GREEN CREEK MINES.—Mike Ryan and Thos. Ward have been quietly at work on the Grove Creek mine, about 11 miles from Bridgeport, having run three tunnels and tapping the ledge in each, getting prospects that have encouraged them to erect an arrastra, which they hope to have running in a short time, and they confidently expect it will soon enable them to put up a small stamp-mill, as it is said they have plenty of good ore to work.

Nevada.

IMPORTANT STRIKE.—Grass Valley Telegraph, August 27: Probably one of the best mining properties in this district is the Union Hill mine, which has just resumed work after being idle since 1870. The mine was worked by an English Co., and just why it was shut down has always been a mystery to everybody who knew anything about the mine. A New York Co. is now operating the mine, with E. A. Wiltsee as superintendent. We are reliably informed that a most important discovery was made in the mine Wednesday afternoon. The new shaft or continuation of a small prospect hole is being sunk about 1100 feet west of the old shaft and is being done in order to strike the ledge below the shaft, where old Halphine once worked and got out such rich ore. The result is that at the depth of 48 feet a ledge varying from 16 inches to two feet was cut and a great number of pieces show coarse gold freely, while pieces that gold could not be seen in with the naked eye were "bruised" up in a mortar and as a result a good prospect was obtained. It is variously estimated that the ore from the mine will go from \$25 to \$50 per ton, nor is it a large estimate, judging from the past brief but brilliant

history of the mine. Only 10 feet have been sunk on the old prospect hole but the size and quality of the ledge at the recent depth (48 feet) is most encouraging and is almost a guarantee that the Union Hill mine will come up to the expectations and prophecies of so many miners who are acquainted with the ground and who say that it will prove one of the best mines in the district.

IDAHO MINE.—Grass Valley Union, Sept. 1: Some high-grade ore was struck in the shaft of the Idaho mine, the latter part of last week below the 2200-foot level. Some of this ore will be shown at the District Fair pavilion, being from the greatest vertical depth that has ever been reached by mining in this district.

STRIKE IN THE CRAIG.—Transcript, Aug. 28: Some very rich gravel has been found this week in the drift claim owned by the Craig Bros. and situated in Cement Hill district. Forty-five dollars was obtained yesterday from 12 candle-boxes of dirt.

Placer.

GRAY EAGLE.—Herald, Aug. 29: The Gray Eagle mine, located on the divide a short distance this side of Forest Hill, is now working about 15 men, and times around there are livelier than for some time. Everything is in good shape, and the mine is looking well.

PROSPECTING.—The McCarty Bros. of Rock Creek have commenced prospecting near the old Yolo mine, on Bald Hill. They have uncovered the ledge just north of the Yolo shaft, and have struck good prospects.

Tulare.

THE 99.—Visalia Times, Aug. 27: The 99 mine, owned by the Mill Creek Mining Co., now has a tunnel 120 feet in length run in on the veins. Another tunnel 60 feet in length is now being run. Assays from the rock yield from \$30 to \$115 per ton. Offers have been made to purchase the property, but the owners have refused. Work will be pushed on the mine, and it will be fully developed.

NEVADA

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Chronicle, Aug. 29: There has been extracted from all parts of the mine during the week 965-950 2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all of the ore worked at that mill during the week was \$21.50 per ton. Bullion shipped to Carson Mint, \$15,700.45. Bullion now on hand in assay office, assay value about \$12,000.

OPHIR.—We have extracted and raised to the surface 33 tons of ore, the average assay value of which is about \$18.50 per ton.

MEXICAN.—On the 1465 level, the south drift started from the east crosscut No. 1, at a point 518 feet in from the main north lateral drift, has been advanced 33 feet; total length, 220 feet; in vein porphyry showing clay separations.

UNION CON.—The northeast drift started from the east crosscut No. 2 on the 1465 level, at a point 853 feet in from the main north lateral drift has been extended 32 feet; total length, 191 feet, continuing in a harder porphyry formation.

ANDES.—On the 420 level north drift from east crosscut, No. 3 was extended 18 feet in quartz formation.

CHOLLAR.—The north lateral drift from the incline station, 1500 level, is out 18 feet; face in porphyry.

POTOSI.—The east crosscut, 140 feet north of south line, 1300 level, is out 83 feet; face in porphyry. The chutes and station are completed, and the north and south drifts started from the 1400 level winze.

WARD COMBINATION SHAFT.—The joint south-west drift from the shaft, 1800 level, is out 228 feet; face in clay and porphyry.

UNION SHAFT.—The west drift from the 900 level is out 1009 feet, 52 feet having been made during the week.

UTAH.—The southeast drift has been extended 37 feet; total, 210 feet, continuing in a porphyry and quartz formation.

SIERRA NEVADA.—On the 630 level west crosscut No. 1 from the northwest drift, 571 feet from the shaft has been advanced 45 feet; total distance, 900 feet; the formation for the last 12 feet was a mixture of porphyry, clay and quartz.

OCCIDENTAL.—Have extracted and sent to the mill from all parts of the mine a total of 305 tons of ore of the average value of \$19.20 per ton. Have started a winze on 650 level at a point 100 feet south of station, and it is now down five feet in fair-grade ore.

BEST AND BELCHER.—1100 level: East crosscut from northwest drift was connected with a west crosscut from the Con. Va. mine on the 23d inst. Have done considerable repairing on the 1200 level during the week.

GOULD AND CURRY.—200 level: North drift 65 feet above this level has been extended 25 feet through soft porphyry and stringers of quartz; total length, 90 feet. At a point in this drift 85 feet from upraise started last crosscut No. 2 and extended same to feet; face in clay and quartz, showing some value. Have been repairing and retimbering upraise during the week.

ARIZONA.

TOMBSTONE.—Prospector, Aug. 29: Tombstone, as quiet as it apparently seems, is to-day one of the best camps on the coast, not only for its residents, but for legitimate investors in mining property. Nowhere else in the southwest has such a showing been made in silver production as she has recorded; nowhere has the ore been of a higher average grade and nowhere has it been easier of reduction. Though the water problem is a poser that will throttle the district perhaps for many a day, that, and that alone, prevents Tombstone from being the largest silver producer, outside of Leadville, on the continent. Nowhere in the camp has water been reached that ore did not follow. The fact that in some cases it was low grade at the high water marks cuts no especially bad feature except to the croaker. West Side, Emerald, Contention, Lucky Cuss, Grand Central, Sulphuret, all show ore going down into the water, and though in some places the ore at water level is low grade, in many places it is of a very handsome grade. The ore treated from the Emerald averaged 22 to 30 per cent lead and 65 to 70 ounces of silver, and this is the same grade of

ore that still continues on the 700-foot or water level in the two to four foot quartzite fissure of that property, which has been drifted on at this depth for 1350 feet, while the big bodies of ore below water in the Contention that were sank on while the pumps were running averaged low grade, ore going way up in the thousands was also found in small quantities. The Lucky Cuss, as shown by the annual report of that company has fine pay ore right in the bottom of the high water level. Though miles of work exist in this camp above water level, there are still vast blocks of ground that are still unexplored and are just as likely in surface indications as others that have been producers, to say nothing of the blind blankets and deposits that in reason exist.

MONTANA.

ZOSEL DISTRICT.—Anaconda Review, Aug. 29: A new mining camp has been coming into prominence this season from a district heretofore almost unknown. We refer to the Zosel district, about seven miles east of Deer Lodge. Up to six months ago there had almost been no work done in that vicinity. Since that time there have been several important discoveries and considerable work done on them. The character of the ore is carbonates, which continues for about 60 feet, where it changes to a galena mixed with arsenical iron, and averages from \$47.50 per ton per car to \$68. There have been several important discoveries within a mile of these claims that give promise of being valuable mines with development work. New finds are being made almost every day. The camp is most favorably situated, being only seven miles from Deer Lodge, with good roads and an abundance of timber and fine water. There are at present about 70 people in the camp, which contributes about \$5000 per month to the wage-earners of that place. From the date of its discovery it has been a shipping camp, the mines paying for their own development, thus demonstrating that it was a poor man's camp. A mile and a half to the south are prospects equally promising that have lately been found. The ore at this place differs a little from that at Zosel, being more of a chloridizing and milling proposition. These ledges can be traced for several thousand feet and lay in a porphyry belt, which is here several miles wide and is supposed to be the same as those in which the Elliston properties are located. This district must not be confounded with the Oro Fino district, as it is 15 miles north from Oro Fino to Zosel.

IDAHO.

THE COTTONWOOD MINES.—Idaho Avalanche, Aug. 29: The success made in working the ores of the Flint district has brought into notice the prospects lying some four miles north of Flint, known as the Cottonwoods. Twenty-five years ago some claims were taken up in this neighborhood, and from two of them at least some very rich ore was shipped, ore shipment from a small shaft fetching \$3000 per ton. But little work was done on any of the claims, and with the going down of Flint for the first time the claims were all abandoned. Mr. Wm. Quayle, who lives there, some four years ago took up four of the best claims, and has since kept them represented. In doing the assessment work he has accumulated several tons of ore on the dumps. This ore shows the character of the ore to be almost identical with the Flint ores, though so far probably not so high grade. The district is apparently limited in extent almost to the claims owned by Mr. Quayle, the granite showing through the porphyry for only a few hundred feet in width and less than a mile in length.

RUTH.—All three tunnels are being pushed ahead, the middle tunnel being in something over 600 feet, most of the distance in good milling ore.

STORMY HILL.—The lower south drift on this mine is now in something over 150 feet, all in good milling ore, and the north drift at this level is in about 100 feet; most of the distance is milling ore.

LAST CHANCE MINE.—This mine at Flint is producing the richest ore at present mined in Owyhee. Average samples of the shipping ore assay over 2000 ounces of silver per ton, while the concentrating ore now being hauled to the mill averages about 60 ounces of silver per ton.

FLINT COUNTY MINES.—The mill is running on Last Chance ore and doing splendid work, the concentrates assaying upward of 800 ounces silver per ton. A force of nearly 25 men are at work in the mines, getting them in shape for a large production of ore the coming year.

TRADE DOLLAR.—This property still continues yielding rich ore, and looks finely in all the workings.

POORMAN.—The drift recently started from Tunnel No. 3, on the Illinois Central vein, has opened up a large streak of good ore. The crosscut from tunnel No. 3 west to cut the Glenbrook vein is still in hard rock, which is supposed to be the hanging-wall of the Glenbrook vein. The main drift on the Poorman vein still holds out in good ore. A large amount of rich ore is now in the ore-house ready for the mill.

OREGON.

THE SANTIAM MINES.—Albany Herald Disseminator, Aug. 27: Pansan specifications of the Albany M. & M. Co.'s new quartz mill, which was shipped on the steamship Willamette Valley and arrived at Yaquina Monday, are to be seen in the office of the secretary, J. V. Pipe, in this city. It is a complete plant, and will cost when ready for work in the mines between \$25,000 and \$30,000. It is a ten-stamp mill, each stamp weighing 850 pounds, and its capacity is 30 tons per day. The mill and machinery will go direct to Gatesville, and from there will be hauled to the mines on wagons, the contract having been let to B. M. Huston & Co., of this city. The company already has a small mill and retort, and a sawmill, driven by a 40-horse power engine, now in operation at the mines. It will require about a month to get the new mill into the mines. In the meantime the company is working three shifts of men night and day, running a lower tunnel in on the ledge. Thirty tons of ore that will be crushed in a day will be reduced to about three tons of concentrates, which will be shipped to the smelting works, probably to S. F., or the Linnton works. Other companies are ar-

ranging to put in machinery to work their mines in the same district. The Albay M. & M. Co., has erected a two-story boarding-house and has sawed over 100,000 feet of lumber for other buildings at the mines, so it can be readily seen that a thriving camp is already springing up in the Santiam district.

JOSEPHINE GALENA.—Rogue River Courier, Aug. 27: Messrs. Davidson and Bailey have discovered a splendid silver lode of Althouse creek, about 40 miles from this city. The galena carries lead and silver at the surface of the ground which will assay \$70 to the ton. As galena always gets richer as the lead is followed down, this is a splendid strike. They have mountains of iron and extensive copper fields. This galena is just what is needed as a flux for other minerals and the opportunity for a large smelter is a splendid one. The boys have four or five men at work on their new find, sinking a shaft. The ore will be shipped for the present to Tacoma or San Francisco for smelting.

UTAH

THE NEW LA PLATA MINES.—Cor. Park City Record, Aug. 29: Thinking that many of your readers might be interested in the new mining camp of La Plata, and being one of the victims myself, I will write you a brief summary of that camp as seen by myself. The camp is situated in Cache county, and is a good 40 miles from Ogden by the road now traveled. It can be reached by parties on horseback through the Middle Fork road at a distance of 25 miles, but this road is impassable for teams, and at the present time, the Weber County Court has a force of men at work putting it in good condition. La Plata contains a floating population of from 400 to 500 persons, and it is not nearly the place that some of the correspondents of the Ogden and Salt Lake papers would like to make it appear. There are about half a dozen log houses in the camp, and in the neighborhood of 50 or 60 tents, varying in size from the small "A" tent to the large hotel tent which is capable of accommodating from 40 to 50 persons. There are a number of good restaurants, and the hungry prospector can secure almost as good a meal at them as can be gotten at some of the best hotels in the Territory and at just as reasonable prices. Provisions of all kinds, fruits and vegetables are to be had in abundance and at prices that will discount the Park City market. Town lots can be purchased at a mere nominal figure, but no title or promise of title will be given by the claim owners who sell them. The claims that make any showing are the La Plata, the Sundown and the Mountain View, better known as the Wardleigh. There are five or six other claims that look well, but none with the showing that the above named have. These claims are all lying in a line formation, said by many to be similar to that of Tintic, but have not been worked to any extent to speak of. The La Plata has a force of men at work sinking, but up to the time of my leaving camp, the developments had not improved the claim to any extent. The Sundown was not being worked at all, but the owners had sacked a little ore and claimed that they were going to put on a force of men immediately. These parties seem to want to make a sale, but don't hardly know what to ask for their ground. There are from six to seven feet of fine galena ore in sight, lying on a body of gray carbonates. The galena assays from four and one-half to six ounces silver and from 60 to 83 per cent lead. The appearance of the ore would indicate that it also contains some antimony. The carbonate ore had not been assayed that I know of, but it is apparently not a very rich ore. This claim is one of the best looking in the camp. The Mountain View claim is about one and one-half miles from camp, and also has a fine showing of galena ore. It is being worked by the two owners at present, and gives promise of opening up into a good mine. The only other claims that are anyway promising are two owned principally by an Ogden man named Heller, who has a goodly force at work on them and is doing more development work than is being done on all the other claims. The showing on this ground is very good, and the indications point to the opening up of a rich copper lode, as the vein matter is heavily copper stained and the vein quartz contains a large amount of native and gray copper. The balance of the claims are principally locations, with no indications but the discovery and end lode stakes on them, no work of any kind being done. There are from 100 to 200 people arriving in and leaving the camp daily, most of whom carry with them a very poor impression of the country on account of not looking over it properly. The camp will undoubtedly prove a good one if development work is carried on in good shape, and may, if prospected thoroughly and intelligently, prove to contain some fine mines. But at the present time the indications are that the excitement will die out until spring, when all parties concerned there will have cooled down, and not expect to realize immense fortunes or wait the earth for a few gopher holes in the ground, containing a small amount of almost pure lead ore.

WASHINGTON.

MENASTASH GOLD.—Ellensburg Capital, Aug. 21: Our streets have not been so lively in 15 months as they have within the past week, and the change is entirely due to the mines. Strangers are numerous in town, and nearly all are bound for the Menastash, or else seeking information in regard to the mines there. Several parties have returned from the mineral region this week, and all are well satisfied with the prospects. It is free-milling ore and nearly all gold. Many of the ledges are from 40 to 150 feet between the walls. Locations are constantly being made. If the veins go down in a satisfactory manner, the future of the mines is assured, and if this can be demonstrated before snow flies, a great work will have been accomplished. The reports from the Swauk continue good. C. J. Best, the assayer, last week refuted the result of eight hours work by two men with hand mortars on Williams creek, and the result was \$153.80, the gold being 21 fine. The Swauk miners feel greatly encouraged over their outlook, and consider the lack of a mill their only drawback. Every effort is being made to secure one, and it is believed one will be on the creek before long. The citizens of Ellensburg are encouraging the development of the mines with wonderful unanimity.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUG. 25, 1891.

- 458,330.—FIRE-CHAMBER VENTILATOR—P. Abrahamson, S. F.
- 458,151.—CUTTER BAR ATTACHMENT—Baker & Lacey, Bakersfield, Cal.
- 458,441.—SQUARE FOR RAFTER AND STAIR WORK—W. H. Bast, Olinda, Cal.
- 458,335.—HARVESTER—N. L. Darling, Benicia, Cal.
- 458,248.—FARM GATE—A. L. Gericke, Sonoma.
- 458,453.—PACKING EXTRACTOR—A. Goodrich, Astoria, Ogn.
- 458,249.—ELECTRIC POWER BRAKE—C. V. Greenmyer, S. F.
- 458,455.—WHEEL ROAD SCRAPER—A. Harpold, Colton, Cal.
- 458,326.—GLOVE—H. L. Heath, S. F.
- 458,422.—FRUIT-GRADING MACHINE—Jas. T. Ish, S. F.
- 458,170.—QUARTZ-MILL—D. B. James, S. F.
- 458,327.—FLOUR PACKER—M. W. Lipe, San Jose, Cal.
- 458,536.—ELECTRIC UTERINE SUPPORTER—G. F. Mohr, Los Angeles, Cal.
- 458,328.—VAPOR-FORMING ATTACHMENT FOR GRATES—M. Noble, S. F.
- 458,329.—PNEUMATIC GUN—J. R. N. Owen, Eureka, Nev.

The following brief list by telegraph, for Sept. 1, will appear more complete on receipt of mail advices: California—John H. Bonthe, Hollister, tug hook John G. Enke, Los Angeles, apparatus for raising sunken vessels; George Farthing, San Jose, preparing skins; George B. Ha-nell and M. S. Gill, San Francisco, grip for cable cars; James E. Kintzold, Oakland, purifier of steam boilers; M. H. Lawe, Mariposa, many surfaces blackboard; William A. Madden, Madera, lumber clump; Emil F. Moennig and K. A. Haescl, San Francisco, safety device for elevators; Manuel S. Pres, Contra Costa, windmill; William T. Rutherford and A. J. Roberson, Napa, pillow-sham holder; William H. Siebecker, San Francisco, car truck; Borden W. Taylor, Los Angeles, feed water heater; Hiram P. Willard, Tustin, and Ferdinand E. Wood, San Jacinto, table; A. A. Charonnet, Nevada City, variable nozzle; David E. Durye and A. Beggs, Seattle, bearing machine.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PNEUMATIC GUN.—Joseph R. N. Owen, Eureka, Nev. No. 458,329. Dated Aug. 25, 1891. The inventor relates to that class of guns designed to throw, by means of compressed air or gas, shells charged with dynamite or other sensitive high explosives. The object of the invention may be generally stated to be the provision of a gun of this class, which, on account of its construction and the principle upon which it operates, will fire its projectile or shell effectively and with safety both to the gun and to those serving it. Instead of seating the projectile within the reinforce and back near the breech, as usual, and leaving a long extent of bore to be traversed before it leaves the gun, Mr. Owen seats it within the chase of the gun and as near to the muzzle as practicable. All that part of the bore behind it is to serve as a chamber to accommodate and hold the charge of compressed air or gas which is to throw it. The projectile is held in its seat by mechanism outside the muzzle of the gun, and after the chamber is charged with the gas or air under pressure, the latch at the muzzle may be freed by a lanyard, and the gun discharged.

FIRE-CHAMBER VENTILATOR.—Peter Abrahamson, S. F. No. 458,330. Dated Aug. 25, 1891. The objects of this invention are to provide means for supplying the fire-chamber with fresh air and to draw off from it the foul gases which accumulate within it. The invention is applicable to any furnace or fire-chamber, but is especially adapted for boiler furnaces. A proper feed of fresh air to the furnace is effected, and results in more perfect combustion and consequent economy in the consumption of fuel. By the peculiar location and direction of several passages, their dampers may be opened without allowing cold air to rush in, which differs from the effect of opening doors in either end of the furnace or chamber. The fresh air, in coming through the passages provided for it, becomes sufficiently heated to not only avoid retarding combustion, but even to assist it, which will effect an economy of fuel—a result gained the more perfectly by the purifying of the combustion chamber due to the expulsion of the foul gases, owing to the peculiar arrangement of the passages.

FLOUR-PACKER.—Milton W. Lipe, San Jose, No. 458,327. Dated Aug. 25, 1891. In filling sacks with grain, where the grain is discharged by a chute or otherwise into the sack, it is well known that unless the grain is tamped or shaken down while the sack is being filled, it will lie so loosely that the sack will not hold as much by a great many pounds as it will otherwise do. It is usual in filling sacks from threshing machines to use a stick or some such device for tamping the grain as it flows into the sack. This invention consists of an automatic device for doing this work, and in certain means for attaching and detaching the sacks so that the work may be continuous. The inventor states that he has found by the use of this device he can place 8 or 10 pounds more of grain in every sack than could be done with any of the hand-tamping that has previously been practiced.

GLOVE.—Heber L. Heath, S. F. No. 458,326. Dated Aug. 25, 1891. The object of this invention is to provide a glove which is especially useful for teamsters, stage and other drivers by taking all seams out of the front of the fore and middle fingers at the point where the reins pass and between these

fingers. It also provides an economy in the manufacture and saving in the stock. In the manufacture of heavy gloves and those used by drivers, it is especially desirable to make the space between the fingers through which the reins pass as clear as possible of seams, and with this object in view, this inventor has made a pattern in which, by a seam passing between the first and second fingers and points on each side of this seam, the longitudinal seams between these fingers are thrown entirely beyond the fingers. Only one fourchette is used, and altogether but four pieces in the formation of the glove.

HARVESTER.—Naaman L. Darling, Benicia, assignor of one-third to J. R. Dixon, Los Angeles. No. 458,335. Dated Aug. 25, 1891. This patent covers certain improvements in that class of traveling harvesters in which the grain is cut, thrashed, cleaned and sacked ready for market at a single operation, and while the machine is traveling about the field. It consists essentially of two frames hinged together side by side, and supported upon suitable bearing and traction wheels. The engine which propels the machine over the ground, and which also furnishes power to operate the cutting, thrashing and cleaning devices, and also the intermediate carrying belts, is mounted upon one of these frames. The thrashing and cleaning mechanism is mounted upon the other, and the header and extends across the entire front of them. The rear ends of the two parallel main frames are supported upon a peculiarly constructed steering frame and wheels, which support the main frame and allow them freedom of movement about their hinge joints. By a peculiar arrangement of hinges between the header frame and the two main frames, they are all connected without interfering with the movements of the main frames, and by the same devices a sufficiently flexible connection of the various conveying belts is provided for.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 3, 1891.

Many dealers still complain of light trade, but taking all as a whole, there can be no doubt but the volume of goods going out is above the average at this season of the year. Continued building of railroads on this coast gives improved transportation facilities, and does away with the necessity of interior merchants carrying large lines of goods. To this is to be attributed the seeming dullness in some branches of trade. Among iron workers, business is reported good, and orders ahead by several firms. The lower prices ruling for iron and coal are largely in their favor. The money market is easy, with the tendency to still greater ease. Remittances from the interior are setting in more freely. In the speculation markets wheat continues the attraction, although railroad and other securities are coming to the front. Speculation in mining shares is expected to set in before long. When a speculation craze does set in, there is no telling when or where it will end.
